

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

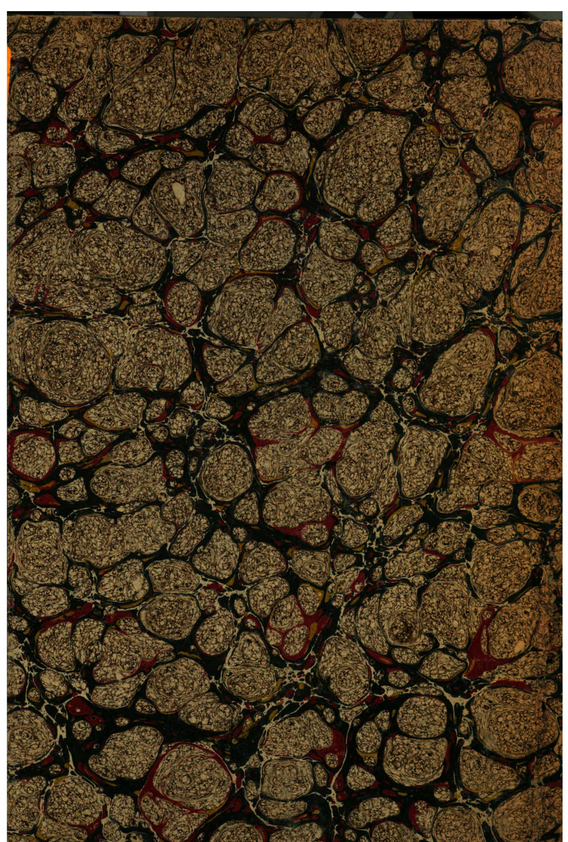
Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.



+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

A LAMP QUESTION—AND THE ANSWER!!

Why do the leading motor car manufacturers of this country equip with SOLAR LAMPS in preference to all others? Why do they pay us a higher price?

Because—

Solar Lamps are the best automobile lamps in the world—bar none. They have more good points than all other makes combined. It is impossible to make a better lamp.

Solar equipment will be found on the following cars:

Apperson	Kissel	Pierce
Autocar	Lozier	Rambler
American	Marmon	Stoddard-Dayton
Corbin	Packard	Stearns
Chalmers-Detroit	Peerless	Thomas
Franklin	Pope-Hartford	White

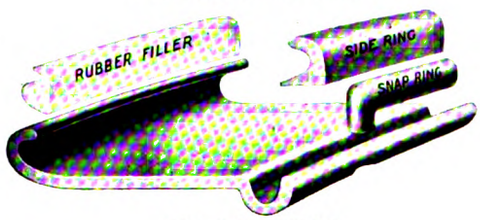
THE Standard Universal Quick Detachable Rim

THE RIM DECIDED ON FOR 1909



The cuts show the simplicity of operation and the mechanical worth of the rim.

FOR DUNLOP TIRE

FOR CLINCHER TIRE

RIM AND PARTS

¶After two years of consideration, the automobile manufacturers have chosen the Standard Universal Quick Detachable Rim as the most desirable of all the rims shown to be the standard equipment for American cars as soon as this change can be conveniently brought about. Its adoption signifies its perfection.

¶ There are only two parts to remove—the side ring and the snap or locking rim. Accommodates all standard sizes of tires, Clincher or Dunlop. To insure standard equipment all around, specify

The Most Marvelous Speed-Indicator Proposition Ever Offered

A NEW

JONES SPEEDOMETER

PRICE **$15** (Model 30) PRICE **$15**

50 Mile Speed Scale

This remarkable offering of a Jones Speedometer for $15.00 will revolutionize the entire speed-indicator industry. It has been made possible through the evolution of speed-indicator construction as practised by this company, and also for reason of the large economies resulting from manufacturing and purchasing in enormous quantities. Furthermore the Jones Speedometer is built in the largest factory of its kind in the world. This fact alone enables this company to produce a speedometer absolutely accurate, handsomely finished and perfectly calibrated for the remarkable price of $15.00—an accomplishment never attempted by any other manufacturer. It means that every motorist can and will equip his car with the most necessary of all accessories—a Jones Speedometer.

The stringent observance of the speed laws throughout this country has made it imperative for every owner or driver of a motor car to carry a speed-indicator. It absolves him from unwarranted arrest—enables him to know his speed at all times. **COMPLETE FITTINGS FOR EVERY MAKE OF CAR.**

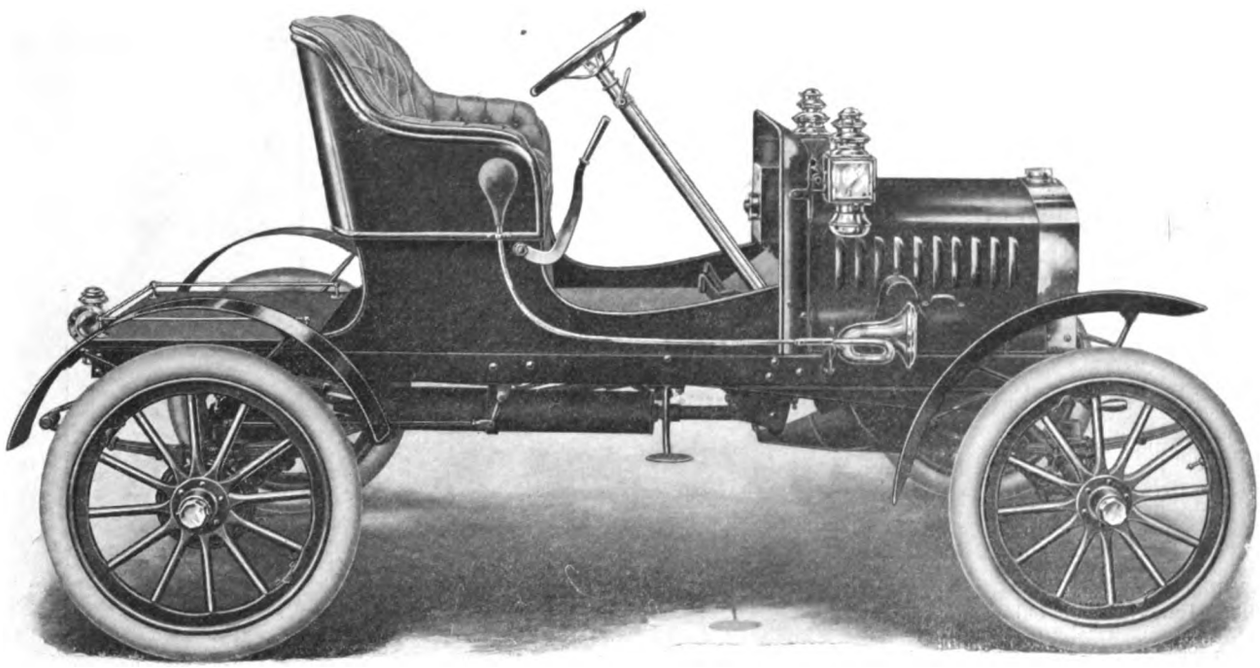
THE KING OF ALL RUNABOUTS

MAXWELL JUNIOR



$500 Two-Cylinder Standard American Runabout.

As handsome a car as the heart of the most exacting motorist could desire; from cooler to tail light gay, debonair, dapper and deft; every line indicating fleetness and power; eloquent of comfort and new-found pleasure in every mechanical detail—such is the new Maxwell Junior.

And—to make the measure of surprise full to overflowing, this marvelous example of automobile value is offered for sale at

$500

a price at which it is difficult to purchase a first class horse and carriage.

Maxwell Junior—Model A

Yet, though it is as cheap as the horse and buggy, what a difference in **performance** and **genuine usefulness.**

Instead of the eight-mile-an-hour pace to which the horse is accustomed the Maxwell Junior is capable of speeding along at **forty miles an hour.**

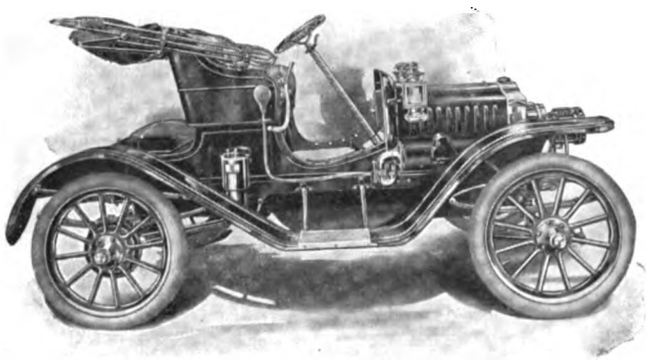
Instead of the 3½ or 4 miles which constitute the average daily travel of the buggy horse the radius of mobility is practically unlimited for the Maxwell Junior.

Requiring no grooming or horseshoeing, no watering or feeding, no veterinary attention, untiring, unfailing in its reliability, and, last but not least: infinitely **cheaper in point of upkeep,** the Maxwell Junior $500 Two-Cylinder Standard American Runabout appeals to everyone of the more than 800,000 people who purchase horses and buggies each year, in the United States.

The **equipment** of the Maxwell Junior is complete and includes pneumatic tires, lamps, horn with flexible tube, tools, tire repair kit, etc. The **car** is complete, without afterthoughts, and the purchaser receives his car in shape for a trip of 50, 500 or 5,000 miles.

Every single item of the Maxwell Junior's specification spells correct design, careful construction, substantiality, real comfort, and

UNAPPROACHABLE VALUE.



More detailed information concerning the Maxwell Junior $500 Standard American Runabout is contained in a special circular, which will be sent free upon application.

Benj Briscoe
President.

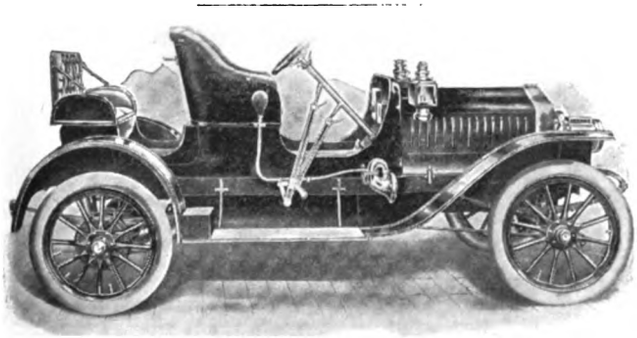
MAXWELL-BRISCOE MOTOR COMPANY—OTHER 1909 MODELS

Two-Cylinder 14 H. P. Runabout, Model LD

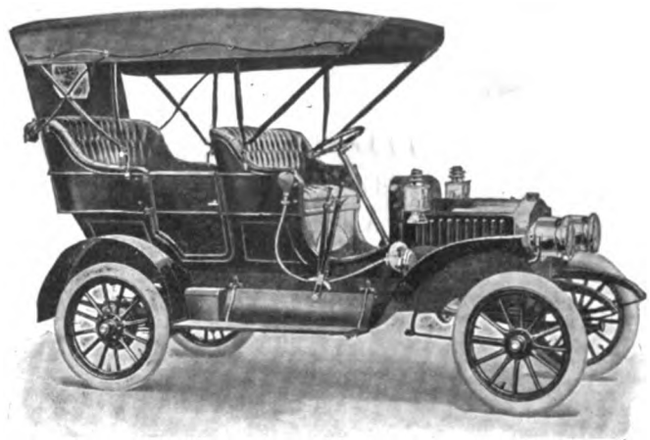
Equipped with top, gas lamps and generator. Wheel base 84 inches. Full elliptic springs in front and rear. Wheels 30 inches. Tires 30x3 inches. Enclosed running boards. **Magneto a part of equipment.** Price $825.



Model L D is the ideal motor car for the man who desires to travel inexpensively, either alone or with another passenger, and it recommends itself to the Doctor, Lawyer, Contractor, City and Suburban Salesman, Builder, Business Man, in fact, to every one whose needs do not exceed economical, safe, and speedy transportation for two.

Four-Cylinder 24-30 H. P. Touring Car—Model DA

Equipped with gas lamps and generator, coat rail, foot rest, etc. Wheel base 104 inches. **Magneto a part of equipment.** Price, $1,750.



The best value ever offered on the American Automobile Market. A stylish car of dignified appearance, with power to spare and of easy riding qualities that make the use of Model DA unalloyed pleasure. The economy of the Maxwell two-cylinder engine also is present in this four-cylinder type, resulting in an unusually great mileage per gallon of gasoline. The power plant is of unrivaled flexibility, built substantially, to withstand hard service. Every feature essential to the perfect utility car is represented in the Model DA Maxwell. The superior equipment and the addition of Magneto ignition make this car lower in price than other of similar power, which are sold at a slightly lower figure, but without our complete equipment.

Four-Cylinder 24-30 H. P. Gentleman's Roadster—Model KA

Equipped with gas lamps and generator, coat rail, etc. Wheel base 104 inches. Speed 60 miles per hour. **Magneto a part of equipment.** Price $1,750.

The acme of refinement, unequalled for luxurious riding. Furnished either with folding rumble, single rumble, surrey or double rumble rear seat. The ideal touring car for two and the choice of the man who wants speed combined with genuine comfort. A low-priced car when the superior and complete equipment, which includes Magneto ignition, is considered.

Two-Cylinder 20 H. P. Touring Car—Model HD

Fully equipped with top, gas lamps and generator, coat rail, foot rest, etc. Wheel base 96 inches. **Magneto a part of equipment.** Price $1,450, fully equipped. $1,250, without top, magneto and gas lamps.

This model represents the car that has done much to popularize motoring in this country. With seating facilities for five and the wheelbase lengthened to 96 inches Model HD will impress the buyer whose chief quest is simplicity of operation, economy in upkeep, reliability in the hardest possible kind of service. A car not too expensive for the business man and good enough for the millionaire.

Two-Cylinder 20 H. P. "Doctor"—Model DR.

Equipped with top, gas lamps and generator, coat rail, etc. Wheelbase 96 inches. **Magneto a part of equipment.** Price $1,350.

The chassis of this model is the same as that of Model HD, and the car has been dubbed the "Doctor" on account of its extensive use by physicians throughout the country. The ample carrying space in the rear appeals particularly to the country physician as well as to the traveling man who desires to carry luggage with him. The light weight of the body gives the car ample power to travel over rough roads and makes the "Dr." an excellent vehicle for use in districts where automobile travel is somewhat difficult on account of adverse road conditions.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. THE BRAMPTON CHAIN is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like **THE CELEBRATED BRAMPTON CHAIN** because some of the other chain makers began to copy the design and shape of the **BRAMPTON CHAIN** links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the **BRAMPTON CHAIN** than ever before. These chains somewhat resemble the **BRAMPTON** in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the **BRAMPTON MOTOR CHAIN** in the past ten years.—**"ENUF SED."**

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the **BRAMPTON FILLS THE BILL,** and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the **CELEBRATED BRAMPTON CHAIN** if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

Stewart Speedometer

For 1909 we announce the most complete and beautiful line of SPEEDOMETERS ever shown—values not possible for any other speed indicator to even equal.

They combine features of workmanship, materials, construction, equipment and performance that have never been equaled by any speed indicator at any price.

Model 5, 90 mile, $50.
Model 4, 60 mile, $40.

Model 4. The same beautifully designed instrument as of last season, to which we have added an improved trip register of three dials, recording miles and tenths, which can be reset to a zero automatically. This instrument will also be equipped with a maximum speed hand. The construction of the mechanism for operating the trip and maximum hands is different to any heretofore used, and enables us to eliminate springs and other devices liable to derangement. Price, ... **$40.00**

Model 5. A duplicate of Model 4 in every feature, but made to indicate speed of 90 miles. Price last season $75, but owing to the enormous quantities being sold we will this season list the same at **$50.00**

Model 9. Comprises the No. 4 Speedometer and a 4-inch 8-day Chelsea Clock, the best automobile clock on the market; both mounted on a handsome brass base, and equipped with electric light **The most attractive combination possible.** Price, ... **$75.00**

Model 11. Something entirely new in speedometer construction. A 4-inch instrument similar in design to the Model 4, but will indicate speed from zero to 60 miles; is equipped with both season and trip register and automatic resetting device. The scale is three times the length of that used on any other speedometer, and which makes it the most easily read indicator on the market. The construction is of the costliest kind, every part is of the same high standard used in all our instruments and includes jewel bearings. **This instrument is destined to be the quickest selling, most attractive, most satisfying of all instruments, regardless of price.** Price, . . **$25.00**

Model 11, $25.

Model 12, $15.

Model 10. A combination of the above described Model 11 speedometer and 8-day Chelsea Clock, mounted on a brass base, equipped with electric light. Price, . . **$60.00**

Model 12. The handsomest little instrument ever produced; will indicate speed of 50 miles; has enclosed season odometer with capacity of 10,000 miles. Is in every feature the same as our $25 instrument of last season, with the exception that it is made with a 3-inch dial. **It is a thoroughly high grade instrument, better than any other speedometer, as a trial alongside any other make will prove.**

All Models to be equipped with the famous Stewart Flexible Shaft and Swivel Joint, and all are **covered by an ironclad 5-year guarantee.** Send for our 1909 catalog.

FRANKLIN 1909

24-Hour Bretton Woods Endurance Run

Franklin 1909, Model D, finished with perfect score.

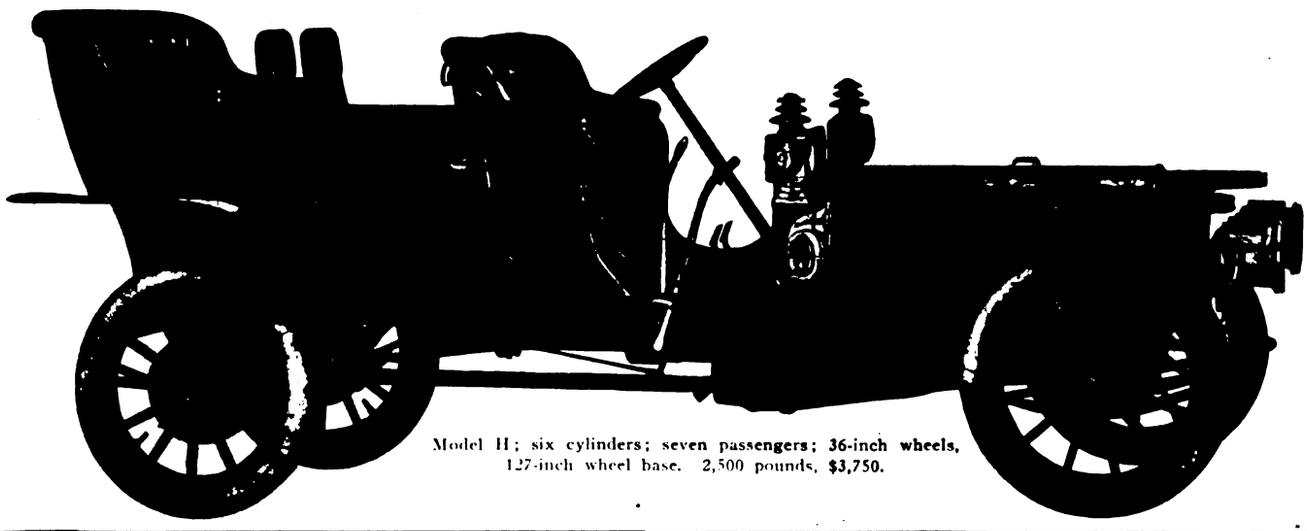
The difference between weight and strength.

Did you notice that the only axles broken in the Glidden Tour were of the solid I-beam type?

There is no better example of the uselessness and disadvantage of useless weight. The ordinary I-beam axle weighs twice as much as the Franklin tubular axle, yet the Franklin axle is a good deal stronger. It is made of 3½ per cent. nickel steel, with a tensile strength of 240,000 pounds to the square inch.

In the same way the Franklin drive-shaft is stronger than an ordinary drive-shaft of considerably greater section and weight.

The Franklin white ash frame built up in transverse layers, is stronger than the ordinary steel frame, although lighter.



Nobody imagines that heavy water-cooling apparatus makes an automobile any stronger. This extra weight is simply one of the undesirable necessities that go with a water-cooled design. By getting rid of this weight and the complication that goes with it, every Franklin model is stronger and safer, as well as more reliable than the average water-cooled automobile that weighs fully a third more, and costs in proportion more to maintain.

The biggest mistake in automobile making is useless weight and bulk.

G 18 H. P.	Touring Car, $1,850. Runabout with hamper	$1,750

Rambler

Model 34

Price $2,250.

THE ADVANTAGES OF THE STRAIGHT LINE DRIVE

Here are some good reasons why the Rambler straight line drive is such a good mechanical feature.

Because it saves you money. Power cannot be carried around a corner without great loss, due to friction. For every bit of energy wasted by friction in the ordinary automobile in transmitting the power from the engine to the rear axle, through universal joints, or, in other words, around corners, you pay just that much more for gasoline and for oil.

The Rambler straight line drive delivers the maximum power of the engine direct to the rear axle, without unnecessary loss through friction. With the offset crank shaft, to further reduce friction when the engine is running under load; with the extra large wheels, big tires and long wheel base to provide perfect comfort; with quality embodied in every detail of the Rambler construction, it is no wonder that the 1908 Rambler has given universal satisfaction.

If you write your name on a postal today, stating the model in which you are interested, we will give you the facts. You will not obligate yourself and we will appreciate it.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, October 1, 1908. No. 1

IMPERIAL IN RECEIVER'S HANDS

Williamsport Concern Gets into Difficulties Through Lack of Capital—Made Few Recent Purchases.

After a considerable period of financial uncertainty, the Imperial Motor Car Co., of Williamsport, Pa., has gone into the hands of a receiver. Rumors that such action was likely have had liberal circulation in the trade for quite a time, as it was known that the concern was seriously hampered in its operations by lack of adequate capital. Although never assuming any large importance, the company made something of a stir about a year ago by a vigorous introductory campaign for its product, the Imperial roadster, emphasis being placed on its straight line drive, "double drop" frame and other constructional refinements.

Activity in the selling end of the organization came to a standstill some months back, however, and the fact that preparations for the 1909 season have not seemed to be under any very great headway has portended the possibility of the present difficulty. Until the receiver has had the opportunity to investigate the company's affairs, no estimates of the proportion of assets to liabilities are available.

Muncie's Factory is Under Way.

Until Thomas F. Hart, the head of the enterprise, can sort out the 1,500 prize offer suggestions for a good name for his automobile company which he has received from the citizens of Muncie, Ind., and can select the most felicitous and suitable one, the concern must go nameless, but the deficiency is not delaying the construction of a large factory on a 14-acre site which has been bought in Muncie's manufacturing district. The capital stock of the company will be $200,000, subject to subsequent increase, and the probable stockholders in addition to Hart will include Madison Maring, T. F. Rose and Ball brothers, the latter being well known Muncie glass manufacturers. All are said to be men of wealth. Claude E. Cox, of Indianapolis, Ind., has been engaged as chief mechanical engineer, and the production will be runabouts and touring cars of medium price. Cox was formerly connected with the Overland Automobile Co., of Indianapolis, Ind., and the new concern's announced intention to "turn out a machine almost identical with one that has been a success on the market," is thought to be not without significance. Past association with the glass business has lead Hart and the others to decide on glass and steel construction for the factory buildings. The side walls will be chiefly of glass.

Chester Company Making Cabs.

Cabs for taximeter service are being made by the Chester Engineering & Machine Co., of Chester, Pa., under contract for Messrs. Hinkle, O'Brien and Lewis, of Philadelphia, who have the concession for the Bellevue-Stratford hotel in the latter city. Six of the 25 machines ordered have already been completed and plans are being considered to have the Chester concern continue to manufacture similar cabs for the general market.

Orders Muncie Parts Claims Paid.

Claims against the defunct Muncie Auto Parts Co., of Muncie, Ind., to the amount of $32,000, including interest, have been allowed by the court and ordered paid by Judge Joseph G. Leffler. In accordance with the court order Harvey Hooke, the receiver, is now trying to convert the assets into cash, the holdings having been appraised at $34,000.

Leaves Corbin for Continental.

W. J. Surre has resigned as secretary of the Corbin Screw Corporation, New Britain, Conn., to become the eastern sales manager of the Continental Rubber Works, of Erie, Pa. His headquarters will be in New York City. The vacancy in the Corbin company has been filled by the election of George P. Spear as secretary and a director.

NEW WAVERLEY OWNERS ORGANIZE

Indianapolis Interests Buy Plant and Business Outright from Pope—Court Approves Terms.

Following the sale of the Pope-Waverley plant at Indianapolis, Ind., to the interests represented by Herbert H. Rice and Wilbur C. Johnson, the purchasers have organized as The Waverley Company and will conduct the business entirely independent of the former owners. The sale was practically completed on September 25, when Judge A. B. Anderson, in the United States district court, directed Albert L. Pope, as receiver for the Pope Motor Car Co., to accept the offer of $200,000 made by Rice and Johnson, the sale to take effect as dating from July 1, with the provision that the $101,000 bank balance held by the plant in Indianapolis banks at the time of the order be turned over to the receiver or a corresponding amount added to the purchase price. The sale includes the property, merchandise, patents, good will and businesss.

The new owners have organized under Indiana laws with a capitalization of $225,000. The company is headed by William B. Cooley as president, with Herbert H. Rice, vice-president; Carl von Hake, treasurer; and Wilbur C. Johnson, secretary. Continuing in the positions they occupied under the Pope regime, Rice will remain as general manager and Johnson as his assistant. The product, as heretofore, will be Waverley electric carriages and commercial trucks.

The capital which made the purchase possible is said to be in no way allied with any other automobile interests, having been supplied chiefly by Indianapolis capitalists whom Rice and Johnson interested shortly after the Pope failure. For the present the factory and sales organization will remain unchanged. The uniform prosperity of the Waverley department in the past indicates future success.

Digitized by Google

In the Retail World.

Earle H. Nevins, of Shabbona, Ill., has started a garage. He will also maintain a repair department, and will sell accessories.

The assets of the bankrupt R. O. Williams Automobile Co., of Columbus, O., amount to $9,547.03 according to the report filed by H. C. Moore, the receiver. The liabilities have not as yet been fully listed.

R. M. Maxfield, of the automobile firm of Maxfield & Rice Bros., Minneapolis, Minn., has purchased the interests of W. C. Rice and W. R. Rice, and will conduct the business alone. The present location at 1401 Hennepin avenue will be retained.

A Cadillac branch is to be opened in Spokane, Wash. Factory representatives are at present arranging for the erection of a garage on the south side of Front avenue, between Wall and Post streets, on the east side of the Salvation Army building.

Robert J. Bronson, proprietor of the Bronson Automobile Repair Co., Milwaukee and River streets, Elgin, Ill., has disappeared from local view, much to the alarm of Elgin creditors. After his departure his establishment presented a barren appearance, except for some few cars left in the garage by patrons.

The Southern Automobile Co., of Charlotte, N. C., has succeeded to Ham & Ross in the agency for Maxwell and Jackson cars and has opened up its salesrooms in the Auditorium building. The new concern is capitalized at $25,000, with J. H. Hamm, president and manager, and J. W. Zimmerman secretary and treasurer.

The Holcomb Co., of New Haven, Conn., which in addition to manufacturing tops for the trade has the agency for several well known cars, is opening a downtown wholesale and retail store for the sale of automobile supplies, at 290-292 Wooster street. This is quite apart from the office, factory and garage at 97-115 Goffe street.

In an effort to straddle successfully the "licensed" and "unlicensed" agency problem, Charles Schmitt, of Hamilton, O., has formed the Butler Auto Co., which he will manage in addition to the West Side Auto Co., of which he is the head. The Butler company will handle only "licensed" cars, while the West Side offerings will be "unlicensed."

"Bennett's Garage" will shortly open in Findlay, O., with the agency for four makes of car, a complete sundry and accessory department, and adequate garaging and repair facilities. Although the sales department will be in charge of F. J. Collinwood and the garaging under Harry Bennett, the ownership of the concern will reside in the C. F. Jackson Co., proprietors of the Glass Block Department Store.

Takes Pope New York Agency.

New York City representation for the Pope-Hartford, which has been the subpect of trade speculation since the relinquishment of the agency by A. G. Southworth, has been settled by the formation of the Pope-Hartford Automobile Co., of New York, which will handle the Pope Mfg. Co.'s cars in Greater New York and its vicinity. The new company, which has been incorporated under New Jersey laws, with $50,000 capital, has taken quarters at 1853 Broadway and has already commenced its selling campaign. H. E. Holt, the president of the company, although having no previous connection with the automobile trade, is experienced and able in commercial affairs, while Benjamin E. Fincke and Charles A. Dickson, of Newark, N. J., treasurer and secretary, respectively, have sold the Pope-Hartford in New Jersey for several years and have been very successful in that field.

Wagner-Field Agency Gets Clients.

Among the first accounts of the newly formed Wagner-Field automobile advertising agency, composed of Fred J. Wagner and Russell A. Field, is the publicity work for the Vanderbilt Cup Commission, in connection with the sweepstakes and Vanderbilt Cup races, the new organization having been entrusted with the heralding of the grandstand and parking accommodations. Through former connections with an automobile publication and as the official starter of the chief motor car racing events, Wagner is well known to the trade, while Field has been automobile editor of a Brooklyn newspaper. Offices have been taken at 1777 Broadway, in the Thoroughfare building, New York City.

Canary Provides Taxi-Service for Chicago.

Dan Canary, one of Chicago's pioneers in automobile matters and who has had a most wide and varied experience in motor car affairs, is starting a taximeter cab enterprise in the Windy City which is to be known as the Dan Canary Tax-I-Service Co. The nucleus for his "fleet," as he designates it, is six Thomas 1909 cabs equipped with Jones taximeters, the vehicles going into commission on October 10, after which date more of the cabs will be added rapidly and regularly. Temporary headquarters have been taken at the old Pardee & Canary salesrooms, 1218-20 Michigan avenue.

A Philadelphia Branch for Maxwell-Briscoe.

William F. Smith, Philadelphia branch manager for Thomas B. Jeffery & Co., has resigned to become territorial manager for the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y. He will have his headquarters in the Quaker City, where a Maxwell-Briscoe branch is to be established.

Haynes Plans Increase of Capital.

An increase of capital for the Haynes Automobile Co., of Kokomo, Ind., is being planned to the extent of $180,000. Investors in Kokomo are said to be prepared to take $130,000 of the amount, while outside capitalists have arranged for the $50,000 remainder.

The Week's Incorporations.

Wilson, Kan.—Wilson Automobile & Garage Co., under Kansas laws, with $3,000 capital.

Detroit, Mich.—National Motor Casting Co., under Michigan laws, with $14,000 capital.

Vincennes, Ind.—Johnson Auto Co., under Indiana laws, with $10,000 capital. Corporators—C. E. Dailey, F. P. Emison, and W. T. Johnson.

Chicago, Ill.—Central Wheel Co., under Illinois laws, with $2.500 capital. Corporators—John T. Watters, Emma Westendorf, Anna J. Westendorf.

South Bend, Ind.—White Garage Co., under Indiana laws, with $10,000 capital. Corporators—Cyrus C. Shafer, Thos. W. Slick, John Shafer and W. A. Slick.

Boston, Mass.—Gray-Aldrich Co., under Massachusetts laws, with $25,000 capital; to manufacture and deal in gas and gasolene engines. Corporators—E. Gray and C. S. Aldrich.

Nashville, Tenn.—Crescent Automobile Co., under Tennessee laws, with $15,000 capital. Corporators—J. A. Wardlow, F. W. Wallace, S. B. Cook, C. N. Woodworth, W. H. Ward.

Boston, Mass.—Oulton Motor & Manufacturing Co., under Massachusetts laws, with $200,000 capital; to manufacture and deal in hydrocarbon motors. Corporators—A. C. Morrison and T. Le Baron.

Buffalo, N. Y.—Chester Auto & Tire Filling Co., under New York laws, with $50,000 capital. Corporators—Theodore Chester, of Sudbury, Pa.; Asbury Chester, Wilson Chester, Harold Carle and H. C. Harrison, of Buffalo.

Brooklyn, N. Y.—Long Island Auto Supply Mfg. Co., under New York laws, with $25,000 capital; to manufacture automobile supplies. Corporators—L. Handel, New York City; H. L. Carr and C. Knopf, Brooklyn.

Wayne-Northern Merger Nears Completion.

Although the $1,000,000 Everitt-Metzger-Flanders Co., of Detroit, Mich., which was based on an amalgamation of the Wayne and Northern interests has been doing business right along, it has been generally known in the trade that the completion of the merger had been delayed. It is now said, however, that the details of the plan have finally been agreed upon and that its consummation will go into effect within the next five or six days. By this means the E-M-F concern acquires the license of the Northern Motor Car Co., and its membership in the Licensed Association of Automobile Manufacturers. The Northern stockholders will take stock in the newer concern, but otherwise there will be no changes, as is explained. Proxies are being obtained of the Northern holdings in Port Huron preliminary to the call for a ratification meeting.

BRITISHERS AVOIDING BIG CARS

Small Machines Hold Their Own in a Declining Market—Upkeep Cost a Large Factor.

London, Sept. 22—Notwithstanding the enormous increase in the employment of the motor car both for business and pleasure purposes, there can be no disguising the fact that, at the present time, the motor trade of Great Britain is in a very grave position; so grave in fact that it is most difficult to say what will happen during the next three or four years. Although to a certain extent the depression is felt upon the Continent, yet there it may be partly due to over-production, coupled with, and, indeed, largely caused by, high prices. To a certain degree these causes have conduced to the existing state of things in England, but this general remark applies mostly to those firms who have devoted themselves almost entirely to the production of cars of high power. The fact is that with, perhaps, one solitary exception, the sales of large cars have fallen off tremendously.

There are several reasons for this, but the principal one is the question of upkeep, which, with the present prices of tires, is truly terrible, and forces itself unpleasantly upon every owner who does not come within the category of the very rich. On the other hand, this heavy depreciation of such vehicles is largely due to the cost of running, at at present, cars which were purchased for from £800 to £1,000 less than two years ago, and are now in perfect running order, can be obtained, second-hand, for £200, or even less. That there is considerable difficulty in finding buyers even at this low price is due to the fact that the cost of running—for that is what "upkeep" really means—is now understood, and the class who can afford to spend £1,000 a year on motoring is strictly limited.

But there is still a demand for small and moderately small cars, though this has received a certain check owing to the number of large vehicles which have been thrown on the market. As a matter of fact the demand for the small car can be best gauged by the prices of second hand vehicles of this class. A reference to advertisement columns of second-hand cars will show this, for it is quite common to see a vehicle which cost not more than £250 new, offered and sold a year later for £200 or even more. Apart from this, the demand is further proved by the fact that for every car thus advertised there are usually many applications. So far then as the medium and small cars, vehicles of from 6 horsepower to 12 horsepower, are concerned, there is little fear for the trade, if only the manufacturers will realize that they must work upon business lines.

Cheap Mail to England in Effect.

More or less extensive relations which the cis-Atlantic automobile trade enjoys with British concerns have in the past been ruffled by the forgetfulness of the American correspondents about the necessity for five cent stamps on the letter envelopes, resulting in additional penalty collections and some hard feeling on the other side. Beginning with the date of this issue, however, letter postage to England is reduced to 2 cents per half ounce, so that one common red stamp will ordinarily suffice.

Windsor Will Make Motor Buggies.

Automobile buggies of the Stanhope type are now being produced at the plant of the Windsor Carriage & Delivery Wagon Works, 100 London street West, Windsor, Ontario, the small Canadian city which lies opposite Detroit. A strong Canadian demand for the buggy type of motor vehicle has determined the company upon extensive manufacture along this line.

Columbia Carriage Produces a Car.

Hamilton, O., is proud over the fact that buggy type automobiles are now being produced within its borders, the Columbia Carriage Co., of that place, having exhibited on the street one of its new 12 horsepower runabout models. The company intends making motor buggies a feature of its line.

Davis to Do Pierce Publicity.

George M. Davis, formerly publicity promoter for the E. R. Thomas Motor Co., of Buffalo, and more recently interested in electrics, has joined the forces of the George N. Pierce Co., Buffalo, N. Y. While publicity may constitute a large part of his work for the Pierce company, his activities will not be entirely along advertising lines.

Locomotive Lights Lear Factory.

Sparks from a passing locomotive and spontaneous combustion from oily rags are two of the various causes assigned for a serious fire at the plant of the Oscar Lear Automobile Co., Springfield, O. The damage to the testing rooms and warehouse is estimated at between $5,000 and $10,000.

Deal Develops a Buggy Type.

Motor buggies have been taken up by the Deal Buggy Co., of Jonesville, Mich. The concern has heretofore been known only as manufacturers of horse drawn vehicles, but a new department has been created which will devote itself to the motor propelled types.

Hayes Acquires National Wheel.

The controlling interest in the National Wheel Co., of Jackson, Mich., having been bought by Clarence B. Hayes, the concern is to be reorganized and the capital and equipment greatly increased. The name will in all probability be changed to the Hayes Wheel Co.

READY MARKET FOR STOLEN TIRES

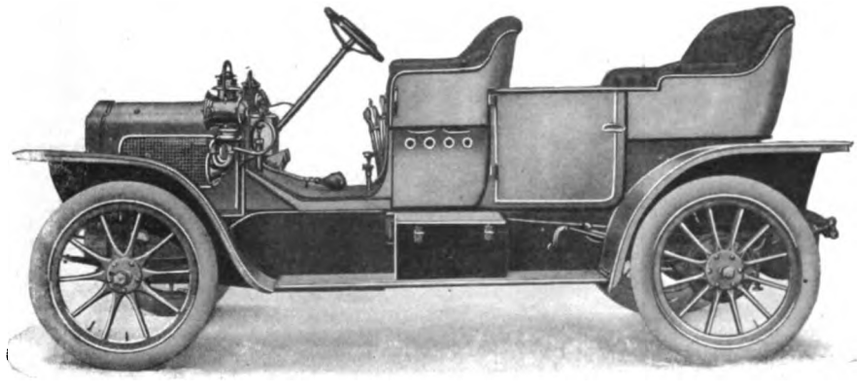
Chicago Police Discover an Alleged "Fence" System—Rubber Company Manager is Arrested.

Traffic in stolen automobile tires, which from single instances of crooked deals among chauffeurs and garage men has latterly developed into an extensive evil, received a setback last Friday in Chicago when the police took into custody John Sweeney, alias John Johnson, and Alexander Lavander, who subsequently confessed jointly to having stolen about 200 cases and tubes and who disclosed what is declared to be a bold and well organized system for the theft and sale of tires for motor cars. As a result of their disclosures, Charles H. Knight, manager of the Chicago Rubber Co., 425 Wabash avenue, was arrested and nearly $10,000 worth of alleged stolen tires recovered.

Four patrol wagon loads of the stolen property were hauled to the Central police station without fully exhausting the supply. The detectives went to the plant armed with a search warrant obtained by Dr. F. L. Hollenbeck, from whose machine a spare tire was taken two weeks ago. Upon being placed under arrest, Manager Knight, of the rubber company, admitted that he had purchased tires from the two culprits whom the police had induced to confess, but he maintained that he did not know that he was buying stolen goods.

The arrests in the case were brought about by detectives seeing Sweeney taking a spare tire from a machine standing by the curb. They questioned him and he told them he was employed by the owner of the car and had been sent to take the tire to a garage. He was taken in tow, however. Later he implicated the others. According to Sweeney and Lavander, the manager of the rubber company paid from $7 to $10 apiece for the tires they stole, and told them that he would buy all they were able to bring to him.

Tire Robbers Take to Diamonds.



Offers of Diamond tires at suspiciously low prices may have an explanation in the fact that robbers broke open the rear window of the Diamond Rubber Co.'s branch at Cleveland, O., on Saturday night, the 26th ult., and stole over $1,000 worth of tubes and casings. Tracks of a horse and wagon in the alley indicated that the thieves had made careful preparation for a wholesale haul.

Streator Factory Spreading Out.

Two new concrete factory buildings are being constructed for the Streator Motor Car Co., of Streator, Ill. A greatly increased rpoduction for next year is being planned.

THE 1909 WHITE STEAM CARS

During the coming season, the White Steam Cars will be built in two distinct models which, while differing widely in size, in power and in price, will follow the same general lines of construction. The horse-power ratings of these cars are based on the actual power delivered at the rear wheels, not merely on formulas or on the power delivered at the engine.

The larger of the new cars is known as the Model "M." It is rated at 40 steam horse-power and sells for $4,000, f. o. b. Cleveland, equipped with acetylene headlights and tank, oil lamps, horn and tool kit. The wheel base is 122 inches; the front tires 36 x 4 inches and the rear tires 36 x 5 inches. The car is regularly equipped with a straight-line seven-passenger body.

The smaller of the cars (shown in the above illustration) will be known as the Model "O." It is rated at 20 steam horse-power and sells for $2,000, f. o. b. Cleveland, equipped with oil lamps, horn and tool kit. The wheel-base is 104 inches and the tires, both front and rear, are 32 x 3½ inches. The car is regularly equipped with a straight-line five-passenger body.

The power plants of the two models are identical in design, the only difference between them being in the dimensions of the various parts. The principal mechanical change in the new cars, as compared with previous White models, is in the engine. The new engine is fitted with the Joy valve mechanism, instead of the Stephenson valve mechanism. The valves are driven from the connecting rods, as are the pumps. The eccentrics are done away with and the cylinders are brought close together, permitting the use of a short one-piece crank-shaft, with but two main bearings. The number of parts in the engine is reduced by one half and the entire construction greatly simplified.

As in previous models, the generator — the simplest steam-making device ever designed — consists simply of a series of coils of steel tubing joined together. The regulating system, whereby the temperature and pressure of the steam remain constant without in any way engaging or requiring the attention of the operator, is similar to that in the 1908 cars.

A circular containing full details of the new models will be sent on request.

NEW YORK, OCTOBER 1, 1908.

Competitive Commercial Types.

In the field of pleasure vehicles there is small room for discussion as to the respective merits of the gasolene and electric types for the various sorts of work such as may be subject to classification. In the commercial field, however, the lines are less closely drawn and with the probable increase of interest in the rivalry over the capture of the business market it is possible to foresee at no very distant time a sharp controversy as to the comparative value of the two types.

In this connection it is of interest to note the discussion of the advantages of the electric commercial vehicle printed elsewhere in this issue, wherein is predicted a somewhat greater field for it than has been looked forward to in many quarters—particularly in the case of the so-called "mixed" or gasolene-electric type, wherein are blended most of the advantages of both elements with an avoidance of sundry of their disadvantages. Hitherto this system of propulsion has been regarded in the light of a hopeful prospect from the theoretical point of view without receiving much encouragement of a substantial nature in the performance of the limited number of vehicles in service, upon which it has been employed. The statement of the advantages of the simple electric vehicle deriving its power current from storage batteries when it comes to short-haul work is little likely to be combatted.

A point which may be received with some little surprise, however, is that the relative costs of charging current and gasolene are closely comparable. Supposing this to be true within narrow limits, the relative costs of operating electric and gasolene vehicles under similar conditions is reduced to the elements of first cost and cost of maintenance. The cost of storage battery maintenance, when conducted along rational and systematic lines, is known to be very low. Hence the maintenance of the gasolene motor and the change gear, which is an invariable accompaniment to its use, stands forth as the chief disparaging element in the relative economy of the two types. With careful treatment and good design, of course, this factor may be brought down to very low terms. But at present it is commonly rated among commercial vehicle users to be unpleasantly high.

Over against what may be termed present data, however, it must be considered that great numbers of gasolene vehicles of the commercial type have come into general use in passenger haulage within a comparatively short period, so short, in fact, as to preclude any close estimate being placed upon their average performance in the matter of economy. That they are of the most modern design, and constitute a vast improvement in many ways over the older types against which many unfavorable conclusions may be drawn, and that they are proving trustworthy in action, argues favorably for the cost figures of the future. Whether they will prove to be of an economical value commensurate with that of the electric, already reduced to terms of close refinement, will be an important as well as instructive conclusion once it has been reached.

About Locking the Differential.

An unusual and rather conspicuous provision laid down in connection with the regulations established by the British War Office for its light tractor competition is that all machines entered shall be provided with means of locking the differential gearing, the lock to be capable of manipulation from the foot board. Aside from any other interest in the forthcoming event this in itself furnishes a suggestive point for consideration by the commercial vehicle designer. The object is clearly that of providing means of securing traction in one of the driving wheels when the other is mired or is "anchored" on a slippery footing. The provision also may be supposed to contain some small element of safeguard against skidding.

It is commonly agreed that the differential gear, particularly with cars of the pleasure type is and has been in the past, responsible for many serious accidents, and that it is by no means perfectly satisfactory in its performance. It has also been suggested more than once that some provision by which its action would be controlled in proportion to the turning action of the steering wheels, or could be checked at will, would be of great benefit. Indeed, several devices have been placed on the market in which a modified differentiation was secured, and in one case—that of a high-wheeled buggy introduced early this year—a true differential brake is employed for the purpose contemplated in the above-mentioned specifications.

Apart from the utility of such a provision from the standpoint of the pleasure car designer, there is every reason to believe that its application to vehicles of the commercial type would be of the greatest benefit. Owners of trucks of both light and heavy patterns are frequently compelled to resort to extreme measures when hauling over wet or muddy courses as a result of the wild and uncontrolable action of the differential gear. The sticking of one driving wheel tends ordinarily to cause the other to be driven at a rate which precludes the possibility of proper traction being secured. The slipping of one wheel at once removes the driving torque from the other. Differential slipping between the two drivers tends to slew around the driven end of the vehicle, much as the swifter moving pleasure vehicle is made to skid. And usually the only recourse to be had is that of blocking one wheel or the other temporarily.

Aside from its mechanical simplicity and the fact that it is absolutely reliable and automatic, there is indeed, little to recommend the ordinary balance gear to the de-

Digitized by Google

signer who is compelled to make every foot pound of motive power tell in the best possible manner. Just when the last ounce of power is most required the automaticity of the differential is apt to interfere to cause considerable losses and vexatious delays. To counteract this effect, it is a comparatively simple matter to provide some method of checking the action temporarily, or, if necessary, of concentrating the drive on either wheel. That such a provision would be well worth its cost almost goes without saying.

Revival of Wayside Entertainment.

A new force in the intrenchment of the motor car in popular esteem is developing in the persons of summer resort proprietors and promoters who more than ever before are coming to appreciate the advantages of catering to that section of the public which is devoted to highway travel. Hitherto their efforts have been so scattered as to be of small importance when considered in the aggregate. The rapidly increasing numbers of motor tourists every year, however, and the fact that its isolation from railroad or steamboat facilities is no longer a bar to the success of an otherwise attractive resort, is having due effect upon the landlords of the more popular recreation centers. Their arousal naturally involves an increase in the number of wayside attractions for the tourist, improvements in accommodations they offer and in the highways by which they are approached and so in a secondary way encourages the constantly increasing importance of the car as a practical means of transportation.

So great has this effect become that even in established resorts where the railroad has long been the chief means of approach and the highroad has been shamefully neglected, the growing use of automobiles has resulted in highway improvements and so, in the increased use of cars until the railroad travel has been impaired to a serious extent. Indeed in one instance the famous "mountain division" of an eastern railroad has suffered a falling off in its receipts during the season now closing of no less than one-third, it is said. The route of the "ideal tour" through the White Mountains of New Hampshire has been clouded with the dust of something like a hundred cars a day on the average this summer, and at one of the resorts in that section no less than 400 guests have sometimes arrived for dinner in touring cars and runabouts.

Hotel men have not been slow to appreciate the advantages to be derived from even the transient trade of the motoring public and their efforts to attract it are in large measure responsible for the tremendous increase in long-distance touring during the past year or two. From this it is easy to see what the future must hold for the vacationist. The lure of the countryside made doubly attractive by the thoughtful provision of mine-host for the comfort of his guests, and the well-laid road to his door which he is also more or less instrumental in providing, must tend to make the motor car more nearly indispensible than ever where recreation is sought.

A Corollary of the Industry.

Despite the continued and frequently offensive presence of vast numbers of cars on the highways it is sometimes difficult to realize the magnitude and importance which has actually been attained by the automobile industry in the few brief years since its inception. Nevertheless, in its relationship to other branches of productive activity it has assumed proportions which are far from negligible. Thus it has recently been credited with assisting in the reinforcement of the copper market—a function which would appear superficially to be about as remote from its general effect as could be imagined. Because of the great demand for brass in lamps, horns, attachments, and to a limited extent in the mechanism itself, as well as the use of copper in alloy, it is said that the automobile is responsible for an increase of no less than 6,000,000 pounds in the sales of domestic copper so far this year as compared with last. This statement appears less incredible when it is said that there are estimated to be some 250 pounds of copper consumed in the production of each average car.

"Dunc" Curry, the clairvoyant, auto editor, etc., attached to the Hearst establishment "has 'em again." Having decided that he is the automobile public, and that all the national associations are contained within his person, he has commenced to imagine that he is the whole industry, also. Having informed an anxious world what he, in the role of Automobile Public "demanded," and "officially accepted" records which are unacceptable by all rules of sport, he now has let the same world know the "unanimous wishes of the trade." Unless his employer is able to induce him to depend less on clairvoyance and more on the recognized rules of sport, and to understand that one, two, or three men do not constitute a national organization, and unless his friends can induce him occasionally to stand in front of an unmagnifying mirror, it soon may become necessary to write it "Donk" Curry.

COMING EVENTS

October 1-2, Indianapolis, Ind.—Indianapolis Automobile Trade Association's sealed bonnet endurance run.

October 2, Poughkeepsie, N. Y.—Race meet in conjunction with Dutchess County Fair.

October 2-3, Brighton Beach, L. I.—Moto Racing Association's 24 hours race.

October 6-9, Chicago, Ill.—Chicago Motor Club's 1,000 miles reliability run.

October 7, 8, 9, Cleveland-Toledo, Ohio—Cleveland Automobile Club's reliability contest.

October 10, Philadelphia, Pa.—Quaker City Motor Club's 200 miles road race, Fairmount Park.

October 10, Long Island—Motor Parkway sweepstakes for stock cars.

October 10, Providence, R. I.—Rhode Island Automobile Club's race meet, Narragansett Park.

October 14-16, Cleveland, O.—Cleveland Automobile Club's reliability run.

October 17, Hartford, Conn.—Automobile Club of Hartford's hill climb, Avon Mountain.

October 17, Kansas City, Mo.—Automobile Club of Kansas City's race meet, Elm Ridge track.

October 24, Long Island.—Vanderbilt cup contest.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

In connection with the present popularity of 24 hours races and the brave array of "records" which is trailing out in their wake it is pertinent to inquire whether anyone at present connected with the promotion of such affairs is aware of the real world's record distance for a drive of twice around the clock. For the benefit of those who cannot do so, it is well to refer to the date of June 28-29, 1907, when Selwyn F. Edge, of London, England, eclipsed all previous records by driving 1,581 miles 1,310 yards around the Brooklands motordrome in exactly 24 hours. This was a continuous one-man performance which, at that remote period was thought to be practically unapproachable.

TRIO OF CARS STILL RUNNING

Persistency of Perfect Scores Prolongs Boston-Bretton Woods Contest—Survivors of Five Runs Start Again.

What may become of "endurance" contests in the days when cars are perfect and highways beyond reproach is being forecasted in Northern New England this week where three patient survivors of the Bay State Automobile Association's Boston-Bretton Woods 24 hours run are still striving to eliminate one another, a full week after the nominal conclusion of the event. Originally there were 22 cars in the contest. But that was last Wednesday, 23d ult., when the affair was still being considered in the light of a 24 hours run. As a matter of fact nine cars survived the difficulties of the first round to the White Mountains and returned with equally good prospects of being awarded the $200 trophy. Of the remainder of the score or two, 6 were under the shadow of penalization, while the balance fell by the wayside.

CONTESTANTS IN CONTROL AT BRETTON WOODS

To comprehend what is involved in the long-continuance of the tie, it must be understood that perfect score involved not simply covering the 375 miles and over of the course on schedule time, and that the course embraced all the charm of highway variety New England is capable of affording, but that the distance must be covered without making a single adjustment to the car or stopping the engine except at one point specified in the schedule.

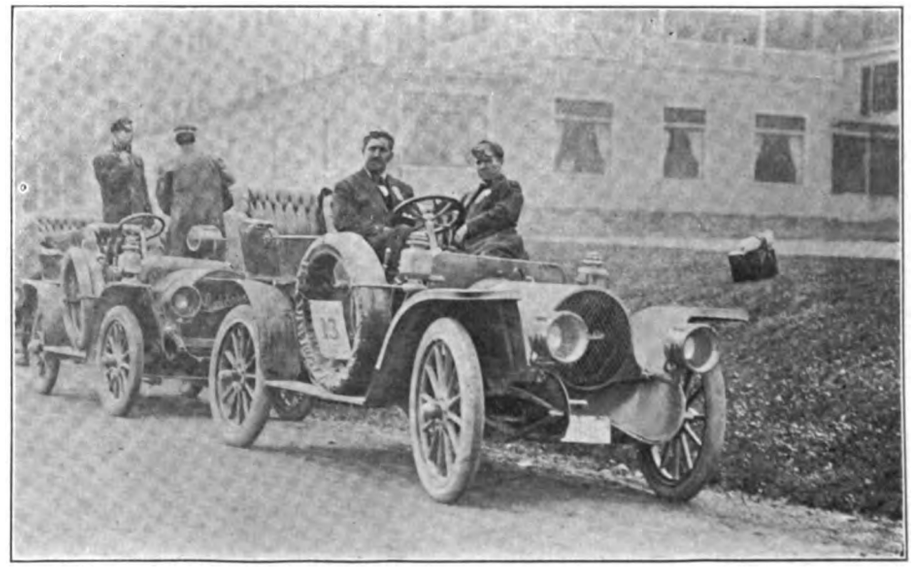
On Friday following the nominal conclusion of the contest, the nine surviving cars with their drivers entered upon the process of elimination which has since been going on. By degrees the list was narrowed down until last (Wednesday) night, when but three remained, namely W. G. Jones' Studebaker, Dan Carris's Franklin, and H. Church's Shawmut. Up to the commencement of the run-off, the status of the contest, expressed in tabular form, was as follows:

Perfect Scores at End of 24 Hours.

Frank E. Wing, Marmon.
Harry Fosdick, Lancia.
A. Ayer, Shawmut.
H. Church, Shawmut.
Dan Carris, Franklin.
W. G. Jones, Studebaker.
F. Snyder, Oldsmobile.
Fred H. Pratt, Reo.
J. Coakley, Buick.

Penalizations End of 24 Hours.

	Points Lost.
E. W. Williams, Rambler	1
Harry W. Knight, Pierce	2
A. T. Fuller, Cadillac	22
S. F. Goss, Corbin	25
William Hilliard, Lancia	74
Oliver Light, Chalmers-Detroit	96
*C. Canterbury, Stevens-Duryea	1,000
*Frank Wentworth, Overland	1,000
*Lacaine, Buick	1,000
*L. Dore, Overland	1,000
*Mrs. Mabel Stearns, Overland	1,000
*A. H. Waitt, Buick	1,000



* Withdrew.

The contest had a highly spectacular start. Beginning in the dead of night, it was exceptional in being the first road contest to set out in this manner and the cars with their acetylene searchlights presented a weird appearance as they lined up in front of the Bay State Automobile Association's club house at 10 p. m., awaiting the word "go." A crowd of several thousand persons was on hand to see the start.

The run to Bretton Woods was made via Portsmouth, Rochester, N. H., and the Ossippees, and almost at the very outset cars began to have trouble. The majority carried four headlights with an extra movable searchlight to spot sign posts, but the dense pall of smoke from the forest fires, combined with a damp fog, was too heavy for the shafts of light to penetrate to any distance. Consequently the road was extremely hard to pick and caused several drivers to lose their way.

As far as Portsmouth, N. H., the route was excellent, but between that point and Rochester the character of the roads suddenly changed and the well laid macadam gave way to the soft sandy ruts for which this section is famed. Rochester, the first control, was reached about 3 o'clock Thursday morning, nearly every contestant going through on time.

However, before the White mountain control was reached, several cars had met with trouble, necessitating penalizations. Hilliard's Lancia had carburetter trouble owing to dirt in the gasoline; Frank Wentworth's Overland had lost time in adjustments, as had Light's Chalmers-Detroit. The Corbin driven by Goss had trouble with its steering gear on the way to Rochester, and Mrs. Stearns (the only woman driver in the contest), who pluckily drove her Overland runabout, suffered from injury to a gasolene feed pipe near the same spot, while George Canterbury was obliged to withdraw his Stevens, when the fuel tank punctured. Harry Knights failed to take on sufficient fuel before tackling the mountains and when his Pierce stalled, it cost him two points.

DAN CARRIS, FRANKLIN, PERFECT SCORE

While the contestants were a pretty hard looking half-frozen crowd when the first leg of the run finished at Bretton Woods about 8 a. m., Thursday, they were for the most part in fairly good spirits. All were covered from head to foot with dust and grime and when some of the drivers facetiously inquired for the manicure lady that person

Digitized by Google

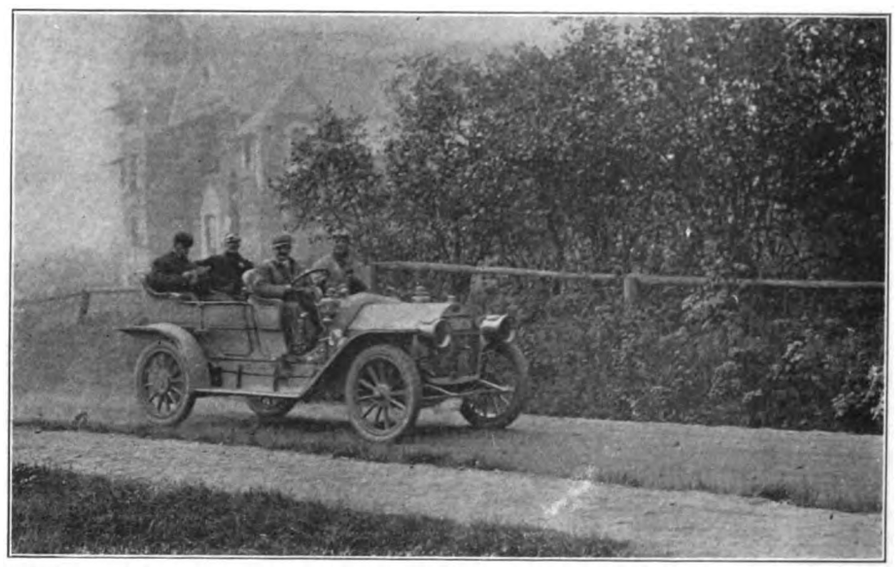
discreetly retired from business for the time being. It was generally agreed that the trip thus far had been a success, in spite of the adverse conditions encountered. A rest of one hour had been scheduled, before beginning the return trip, but as the contestants desired a little more time to

W. G. JONES, STUDEBAKER, PERFECT SCORE

stretch themselves and thaw out, the committee extended the rest period to 1½ hours. Then Arthur Knights set out with the confetti car and blazed the trail back to Boston.

Oliver Light was first to sample trouble on the return, when he failed to get his car away from the control and lost 82 points in addition to his previous penalization. The Rambler driven by E. W. Williams had a point chalked against it when its intake pipe got choked with dust and stalled the motor for 20 seconds.

Concord, N. H., was the first control on the return journey, and the run to this place was anything but joyous, the worst spot being the climb over Mt. Agassiz. The Buick touring car entry in charge of Lacaine, mixed things up with a fine young colt while going through Plymouth, N. H. The colt got so gay and frisky that it climbed into the car and forced it into a ditch, putting it completely out of commission. It seems that the animal was being trained by its owner to get accustomed to motor cars and unluckily for the driver, the beast was a little too eager in the pursuit of his education.



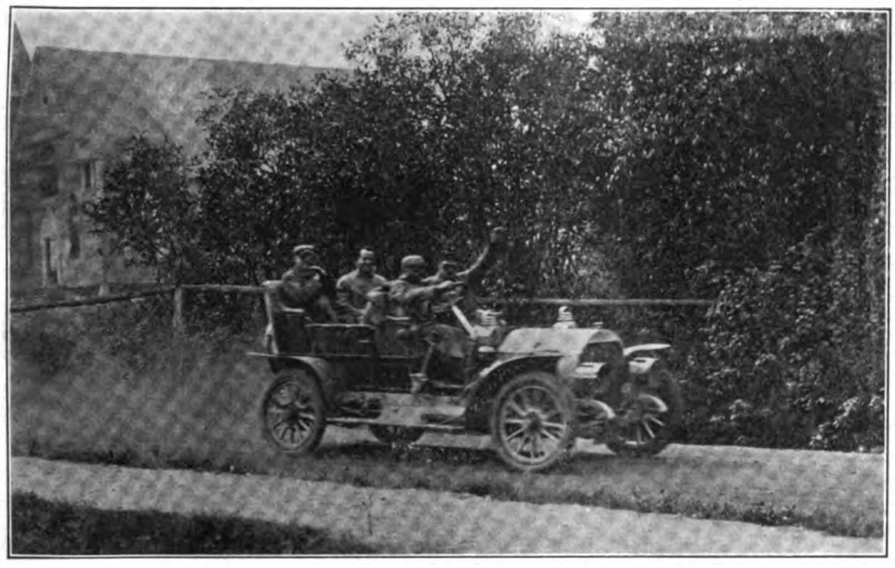
S. F. Goss pulled his Corbin into Concord 6 minutes late, which added to the time lost in tinkering with the steering gear and the 1½ minutes his engine stalled, cost him a penalty of 25 points. Hilliard had extremely hard luck with the Lancia he was piloting. He spent nearly an hour trying to get his carburetter working properly after dirt had put it out of commission and when he finally got running again, he was 16 minutes late at the control and lost a total of 74 points. The Cadillac handled, by A. T. Fuller, pulled into Boston 21 minutes late. Its motor had ceased running for less than a minute, which caused him a total fine of 22 marks.

The balance of the penalized cars did not finish at all. Canterbury was unable to make a repair on his tank and get into the running again, and Frank Wentworth, who got as far as Cambridge with an unbroken score, ran his Overland into a ditch and snapped off a wheel. The two other Overland entries were in the same hard luck. L. Dore had a reluctant carburetter and Mrs. Stearns, after losing 27 points for work on a gasolene feed, stalling the motor 2 minutes and reporting 13 minutes late at Rochester, gave up and did not return to Boston. Lacaine, who got as far as Bretton Woods with a clean score for his Buick, was obliged to quit, as did A. H. Waitt, the other Buick driver, who was forced into a ditch by the colt.

When the run proper terminated, the committee decided to begin the run-off on Friday, September 25, at 10 p. m., starting at Boston and retracing the route. Of the nine perfect score cars, seven started on the second round trip. These were Wing's Marmon, Fosdick's Lancia, Carris's Franklin, Jones's Studebaker, the two Shawmuts of Church and Ayer, and F. Snyder's Oldsmobile. Fred Pratt's Reo and J. Coakley's Buick, both runabouts, did not attempt to fight it out with the rest.

The seven drivers were not literally overcome with joy at the prospect of the long, tedious task confronting them, when their cars were unlocked at the garage. Bretton Woods, which had to be reached in 14 hours, was to be the only control on the round trip until Boston was reached again and only one hour was provided for luncheon and rest at this point. This was also the only time that the engine could be stopped.

The same horrible weather, the same ruts and bumps greeted the pilots on this second circuit, but the test only sufficed to reduce the number to six, while it reduced the number of perfect score cars to four. These were the Marmon, Studebaker, Shawmut and Franklin. Fosdick lost one point when his Lancia skidded into a ditch near Bretton Woods and a limited supply of gasolene caused the engine to stall for 20 seconds when tipped at an angle. Ayer, in the Shawmut touring car lost 38 minutes on the run back from Bretton Woods, as a result of gettink stuck in deep sand at Boscowen. The Shawmut runabout, however, fared better and remained perfect.



H. CHURCH, SHAWMUT, PERFECT SCORE

On Sunday, the 27th, the weary contest-

Digitized by Google

ants had an opportunity to rest, and at 6 a. m. Monday, bright and early, the quartet which still held clean tallies, set out upon their third trial for the winning of the trophy.

The route for this day was to Portland, Me., and return, a distance of 180 miles, for which 10 hours was the allotted time. From Portsmouth, N. H., on the roads were miserable and on this part of the journey Wing's Marmon came to grief. At Wells, Me., 28 miles from Portsmouth, the car went into a ditch and broke a front wheel. This reduced the number of survivors to three: Jones, Church and Carris, making the return control on time. Up to this point these contestants had covered 954 miles.

FRANK WING, MARMON, ONE OF THE LONG STAYERS

Installment No. 4 of the run, on Tuesday, saw the plucky little trio of "perfects" start out on about the hardest run of them all. The route was to Intervale, N. H., via Portland, Me., Poland Springs, Bay of Naples and Fryeburg about 200 miles. From Boston to Portland the roads were good and the drivers had no trouble in reaching the first control at the latter place inside the 8 hours schedule. Leaving Portland though, mud holes, and plenty of them, were encountered, the rain having gotten in some of its effective work. Nevertheless, the three contenders reached the night control in good shape.

Wednesday, the fifth try at determining a winner, like its predecessor, was without success. Each of the trio completed the day's run with scores still intact, the cars stubbornly refusing to break down.

The cars left Intervale at 6 a. m., with Boston as a destination, going via Bretton Woods. The committee in charge of the run was non-plussed when it learned Wednesday evening that all three scores were still perfect. At a late hour, however, it was practically decided to make the three survivors keep plugging along and fight the affair out in the same weary way.

CLIMBFEST IN THE BERKSHIRES

Rosenblum, Carey and Hunt Capture the Honors on Snake Hill—Mason and Gustafson Win Motorcycle Events.

That main artery of the Berkshires, the Pittsfield-Lenox State road, was closed for three hours on Saturday last, September 26, when the Berkshire Automobile Club held its climb up Snake Hill near Pittsfield, Mass. The course, which embraced three "hairpin turns" and covered a stretch of 1⅕ miles, was none too safe for such a contest and only twelve contestants could be rounded up to enter cars in the programmed events.

The curtain raiser was called a "free-for-all, restricted, however, to cars costing between $2,000 and $3,500. Phillip Rosenblum of St. Augustine, Fla., captured this, when he sent a Stearns up the incline in 1:47. A 35 horsepower Jackson car, driven by Crotty, made second best time, while Stuart H. Clapp, in a Berkshire, scored third, and L. B. Gragne fourth with a Pope-Hartford.

I. M. Carey, at the wheel of a Pierce Arrow, swung around the turns to best advantage in the $4,000 class, getting up the slope in 2:07. This was a little better time than that of Daniel England, who was second with a Peerless.

The steam class proved to be a case of "On Stanley, on!" Dr. G. P. Hunt, in a steamer of that renowned characteristic, proved a little too good for Erwin H. Kennedy, driving another of the same make, when he whistled up like a peanut organ in the miserably slow time of 2:54.

Two motorcycle events, for one cylinder and two cylinder machines, respectively, were won by Alfred T. Mason (Curtiss) and Charles Gustafson (Indian), the latter making the hill in 1:38, which was a good deal better performance than that of any of the automobiles.

The summaries:

Free-for-all, $2,000 to $3,500—Won by Philip Rosenbaum (Stearns); second, Crotty and Holbrook (Jackson); third, Stuart H. Clapp (Berkshire); fourth, L. B. Bragne (Pope-Hartford). Time, 1:47.

$4,000 Touring Cars—Won by J. M. Carey (Pierce Arrow); second, Daniel England (Peerless). Time, 2:07.

Steam cars—Won by Dr. George P. Hunt, (Stanley); second, Edwin H. Kennedy (Stanley). Time, 2:54.

Motorcycles, one cylinder—Won by Alfred T. Mason (Curtiss); second, J. A. Finkle (R-S); third, L. V. Vine (Triumph); fourth, Edward David (Marsh-Metz). Time, 2:13.

Motorcycles, two cylinders—Won by Charles Gustafson (Indian); second, F. A. Minkler (Indian); third, Oliver R. Hutchinson (Marsh-Metz). Time, 1:38⅕.

Wilmington Holds a "Roadability Run."

Despite the long list of novelties in the arrangement of automobile contests, in which nearly every apparent possibility has long ago been thoroughly explored, if not exhausted, it remained for Wilmongton, Del., to give birth to yet another new sort of contest which was held on Saturday last, September 26th, and billed as a "roadability run." By the rules of the affair contestants were to drive over a known course from Wilmington to Coatsville, Pa., and return, a distance of 70 miles, following a blind time schedule which was left entirely to the individual imagination of each of the drivers. He who succeeded in approaching nearest to the secret schedule established by the judges prior to the start of the race, was to be adjudged the winner—quite independent of the performance of his car in other respects.

This peculiar honor was accorded to William T. Hammond, who drove his own 20 horsepower Mitchell runabout. He crossed the finish line 4 hours 38 minutes after starting. This was within 8 minutes of the secret official schedule time of 4 hours 30 minutes.

Second prize went to Charles C. Kurz, driving a Franklin, who was one minute behind the winner, and third honors were won by William Stanier with a Franklin runabout, who was 11 minutes off schedule, and three minutes behind the winner. All but two of the two dozen entrants finished in good shape with "perfect scores," save for their sealed time penalizations.

Ryan Speediest up "Old Baldy."

For the third time, Harmon D. Ryan, driving a White steamer, won the annual 100 miles race for the Fenner trophy, from Los Angeles to Mt. Baldy, Cal., on September 20. The other contestant in the event, a Kisselkar, dricen by Latham, was beaten by 39 minutes, Ryan's time being 3 hours 34 minutes.

RIDE RINGS AROUND COMPETITORS

Drach and Leiser Win Milwaukee 24-Hours Race by Nearly 200 Miles—Two Fence Smashing Incidents.

Duplicating their achievement of last year, a team composed of Bob Drach and Fred Leiser, driving a Locomobile, entered by Dr. J. F. Schreiber, won the Milwaukee Automobile Club's 24 hours race at State Fair park, Milwaukee, on Friday and Saturday, September 25 and 26. They covered 992¾ miles in the allotted time, beating the nearest competitor, R. B. Mader (Mitchell) by nearly 200 miles, and improving their old mark for this track by a good margin. While the total distance covered was more than 100 miles short of the American record, it sets up a record for the Milwaukee track that will doubtless stand for some time, for this course is not an ideal one or as smooth as might be desired for such contests. After a few hours the dirt surface was completely worn from the track and the balance of the contest was run over what had become a ragged, rocky path.

R. Bader scored second place with his Mitchell, covering 808 miles and the Condon-Gesskins team in the White steamer, was third with 712 miles, after having given Bader a hot duel up to the 16th hour. The Midland driven by J. E. Miller and F. Roessler, was fourth with 693 miles; Heber-Odenbrett, the Buick team, fifth, 519 miles; and the Frellson-Eierman combination sixth with the Jackson entry, dropping out in the 17th hour at 350 miles. The Petrel with Schwader-Wait up, ran only 96 miles, and Rentner's Maxwell was retired by a mishap after covering 38 laps. Drach and Leiser kept the Locomobile at the head of the procession practically the entire race, taking the lead from the Mitchell in the second hour and holding it thereafter. The race was started by Mayor Rose at 4 o'clock Friday afternoon and the sensational and melodramatic features of the contest began almost immediately. Before the first hour was up Al Rentner, driving a Maxwell, sent his car through a fence, bruising himself slightly and damaging the car considerably—also the fence. There was no hope of making a repair and the car was withdrawn.

From the outset, it was quite evident that the Locomobile, Mitchell and White were going to outspeed the rest of the field and would finish in one-two-three order, barring accident. Mader's Mitchell held second place between the second and sixth hours, when unfortunately a pin lost from the magneto caused it to stop more than an hour for adjustment, giving second place to Condon's White. It was not until the 16th hour that Mader regained second place; the White having had trouble with its water tanks. From that time on, Mader held his position safely. Miller and Roessler, in the Midland, held fourth position throughout, while the Petrel, in charge of Schwader, withdrew after running six laps. Bates and Odenbrett had cylinder trouble with their Buick and lost more than six hours Saturday in trying to get the motor to run.

During the sixteenth hour, a second smashup occurred. Rudolph Eierman, at the wheel of the Jackson car, banged into the fence near the quarter-mile post with a loud crash. Fortunately neither Eierman nor Bucler, his mechanician, was seriously injured. The car bent its front axle beyond repair and was forced to withdraw.. Eierman declares that he was blinded by a cloud of dust, which fooled him as he was rounding the turn.

Indeed, dust bothered all of the drivers terribly. Bob Drach, who piloted the winning car, much of the time had his eyes inflamed so badly that he required the services of an eye specialist. On Saturday he returned to the wheel and gamely finished the race with one eye bandaged.

In addition to winning, the Locomobile had the distinction of scoring the greatest number of miles in one hour. In the 11th hour of the contest, Drach covered 50 miles, a really remarkable performance considering the ruts and dust on the track. The car went through without the least trouble other than tires.

Previous to the long race on Friday afternoon, a few short events were run off. In these, Harry Nelson, in a Pope-Hartford, gathered most of the laurels, winning four races. Nelson beat John Heber in a Buick (the only other competitor) by more than a mile in the ten miles race for the Augie Jones cup, and in the five miles handicap, in which the Buick received a flying start of half a mile, the Pope-Hartford again outclassed the smaller car, catching it in the fourth mile.

Milbrath, at the wheel of a Peerless, won the "Judge Neelen" five miles event, which was "open only to those who have come under Judge Neelen's supervision." In doing he outran a field of six cars. A. C. Brenckle, in a car known as the "Red Devil"—a new name for a motor car—also faced the starter in this event.

C. H. Neil, in a 90 horsepower six-cylinder Stearns, and Harry Nelson, at the stem of a four-cylinder car of the same make, gave an exhibition five miles race that was a "thriller." While hitting a mile-a-minute gait, the "six" blew up a tire with a loud report, taking a bad skid. It was undamaged, however. Nelson's four cylinder car finished in 6:18.

The summary of the 24 hours race is given in the accompanying table.

SUMMARY OF MILWAUKEE 24-HOURS RACE, BY HOURS

	Drivers and Car.	1	2	3	4	5	6	7	8	9	10	11	12
1	Drach-Leiser, Locomobile	41	87	129	167	212	253	291	333	371	408	458	503
2	R. B. Mader, Mitchell	44	87	117	160	200	200	234	272	308	343	364	405
3	Condon-Gesskins, White steamer	35	78	114	139	178	219	255	296	330	367	406	426

	Al. Rentner, Maxwell												

Christie Gives Montreal a Thrill.

Walter Christie's journey in search of fame and fortune led him to Montreal, Canada, where, on Saturday and Sunday, September 26 and 27, he distinguished himself by setting up the mark of 1:10, which was gravely announced as breaking the "world's record for one mile on a half-mile track." Other star performers in the cast of the two-day program were Barney Oldfield and Charles Soules. Oldfield's best two-lap turn was exploited in 1:15. Interest in the huge crowd of spectators rose to a fever heat when Soules lowered the figure by a minute. Christie's exhibition following immediately afterward was the immediate cause of riotous enthusiasm.

WISEMAN NEARLY WHOLE SHOW

Many Thousands See Him Capture Three Events at Tanforan—Free's Comet First in Exciting Novelty Race.

Any one entertaining the slightest doubt as to the Pacific Coast's enthusiasm over motor track racing might have been thoroughly reassured by taking a trip to Tanforan Park, San Francisco, on Sunday, September 20, when the Olympic Club held its second annual track fest. The park was crowded almost to its capacity with 10,000 spectators, occupying the grandstand and field, while by actual count there were no less than 750 cars parked about the rail.

The star of the matinee was F. J. Wiseman, who at the wheel of a Stoddard-Dayton, won the three events in which he was entered, two 10 miles stock car races and a free-for-all. The best time of the day for a mile lap was scored by Fred Dundee, driving a White steamer in a 10 miles bout with C. Kellogg (Peerless), and V. Verilhae (Thomas). Dundee won the event and did one mile lap in 1.02, setting up a new mark for the track in the fully equipped stock touring car class.

In the opening five miles event for members of the Olympic Club, three contestants blinked when the starter's pistol was fired. C. S. Howard began to leave Rosenfeld's Peerless, and Boas's Thomas in his wake, soon after the start. He was never headed.

Cars listing at $2,750 and under participated in the second dash and Wiseman took the event with ease, pushing his Stoddard-Dayton around for 10 miles in 11:11⅗.

Howard again distinguished himself in the $2,500-$3,500 class 10 miles, leading the entire distance.

Bert Dingley fought it out with Wiseman in the next 10 miles race and provided the biggest excitement of the afternoon. It was nip and tuck for three miles, the latter sticking to the Stoddard-Dayton car until in the fourth mile showed Dingley that he was a little too good for him. Wiseman was not passed thereafter and won in 11:25.

F. Free, who was expected to be a "feature" with his Comet car, did not come to life until the novelty race. In this drivers raced on foot a distance of 50 yards to their cars, cranking the motors and then driving one mile. Dundee and Howard jumped away first, but the Comet driver soon cut loose on his orbit, passing the White and eclipsing Howard's Buick at the tape.

Following this event, Fred Dundee redeemed himself in the $3,500 and over class, when he won with the White in 11:16, and also made the 1:02 mark for the mile.

Wiseman triumphed for the third time in the last event on the program—the free-for-all. The Stoddard-Dayton easily disposed of the Comets, driven by Free and Cooper, the White entry meeting with generator trouble. Wiseman's time was 11:21⅘, 10 seconds slower than his first performance for the distance. Two five miles motorcycle events were on the card, W. G. Collins and W. Dreyer, riding Indian machines, being the respective winners. The summaries:

Five miles handicap, for members of the Olympic Club—Won by C. S. Howard, 5 seconds, (Buick); second, Max L. Rosenfeld, scratch, (Peerless). Time, 6:08⅕.

Ten miles, stock cars, listed at $2,750 and under—Won by F. J. Wiseman (Stoddard-Dayton); second, Bert Dingley (Chalmers-Detroit); third, C. S. Howard (Buick). Time, 11:11⅗.

Ten miles, stock cars listed at $1,500 and under—Won by C. S. Howard (Buick); second, T. Hart (Sunset); third, Frank Murray (Buick). Time, 11:10⅗.

Ten miles, stock cars listed at $2,500 to $3,000, inclusive—Won by F. J. Wiseman (Stoddard-Dayton); second, Bert Dingley (Chalmers-Detroit); third, Fred Dundee (White). Time, 11:25.

One mile novelty race, machines on scratch, drivers to go back 100 yards, run to cars and crank them and drive a mile—Won by F. Free (Comet); second, C. S. Howard (Buick). Time, 1:41⅗.

Ten miles, stock cars listed at $3,500 and over—Won by Fred Dundee (White); second, C. Kellogg (Peerless). Time, 11:16.

Ten miles, free-for-all—Won by F. J. Wiseman (Stoddard-Dayton). Time, 11:21⅘.

Five miles motorcycle, free-for-all—Won by W. G. Collins (Indian); second, A. Holsberg (Thor). Time, 5:20⅕.

Five miles motorcycle, single cylinder—Won by W. Dreyer (Indian). Time, 7:09⅕.

It is Now a Morrell-Thompson Row.

"If Robert Lee Morrell, one-time chairman of the A. A. A. racing board, and now chairman of the Automobile Club of America's contest committee, and Jefferson De-Monte Thompson, present chairman of the American Automobile Association's racing board, would stand aside and were eliminated from consideration, all trouble between the two organizations would disappear as if by magic," is the opinion expressed by one of the men in position to know the what's what of the controversy. "The renewed upheaval," he continued, "is largely a bitter personal affair between those two men and until some one orders or induces them to 'go hence,' I do not believe any very lasting peace is possible. Morrell, who trains with the 'auto editors' and clairvoyants and gives them lots of 'tips,' believes he has 'put it all over' Thompson and Thompson—well, I don't know just what he does think. But both men are stubborn and so anxious to 'do' each other that they don't appear to care what turmoil they create and as both have the time and the money, unless they both are thrown overboard by their respective organizations, they probably will play the part of Kilkenny cats for an indefinite period, and the sport will suffer meantime."

TO INTERPRET THE ARGUMENT

A. C. A. and A. A. A. Committees to Hold Conference—The Brighton Beach Outlaws Profiting by the Tangle.

It transpires that the remarkable agreement whereby the American Automobile Association practically conveyed most of its power over competition affairs to New York's local organization, the Automobile Club of America, never was designed to mean what it says. Men on both sides agree that it was not their intention, as stated by the now famous or infamous definition of an "international race," that all open or free-for-all contests should be made international or to permit any crafty promoter to bunco the public merely by labeling his project "international."

In order to rectify these misunderstandings and to obtain a clear interpretation of the agreement, both organizations are to appoint conference committees, the A. C. A. already having designated W. P. Hamilton, Dave H. Morris, W. G. McAdoo and Robert L. Morrell for the purpose.

Meanwhile, the press agents of the outlaw Motor Racing Association, Inc., are making the most of their opportunities to secure free advertising for their forthcoming 24 hours race. By labeling it "international" and securing an A. C. A. sanction, they claim that the A. A. A. has no jurisdiction over them, with which the A. A. A. does not agree, and which really is of minor importance compared with the fact that practically all of the entrants suspended themselves by competing in the racing corporation's previous outlaw race which was run without regard for either the A. A. A. or A. C. A. As the men have not been reinstated by the A. A. A. they clearly are ineligible to compete, the basic principle of all agreements between all sports-governing organizations being that each shall respect the other's rules and punishments. It would seem, therefore, that if the Automobile Club of America does not uphold the A. C. A. in the present affair, it will violate the ostensible principle for which it originally contended and will indicate that it did not act in good faith in entering into the agreement.

Outlaws to Drive at Brighton Beach.

Unless the American Automobile Association is unwontedly successful in reinforcing its barrier of disqualification against them, practically all the drivers who were recently placed under the ban as a result of their participation in the outlaw 24 hours race of the Motor Racing Association, will again be seen under similar circumstances in the second twice-around-the-clock contest under the same management on Friday and Saturday, October 2 and 3, at the Brighton Beach track. To date, 14 cars have been entered, 11 of which are of American manufacture.

"13" MAKES ONLY PERFECT SCORE

Hargrave Wins Kansas City Run—Eight Days' Battle with Rain and Mud—Farmer Gathers Rich Graft.

One perfect score, eighteen with scores and three without, tells in brief the story of the eight days' endurance run of the Kansas City Automobile Club, which was brought to a close on Saturday last, 26th inst., when 21 tired drivers drew their cars up along Grand Avenue, Kansas City, and patiently waited while the technical committee minutely examined engines, transmissions, axles and whatnot in an effort to prove that nothing had been left undone to knock the underpinning from perfect scores. Fortunately for the future peace of mind of the technical committee it did not have many technical penalizations to mete out, as there was only one perfect score before it got to work, and there still remained one perfect score when the committee finished its labors.

Harry Hargraves' Corbin was the perfect score winner, its nearest competitor being E. J. Anderson's Rambler, penalized 6 points. Several attempts were made to dislodge Hargrave from his position, as the entrants of cars that finished with only a few points against them discovered a bent axle on Fletcher Cowherd's Corbin, which Hargrave drove. After a round-the-block demonstration that that affliction was not sufficient to prevent the machine from undertaking another long tour, however, the committee was satisfied that no penalty was necessary.

It would not be stretching the truth to say that it is doubtful if any endurance run has ever been held that provided a more racking strain on cars and drivers than the one promoted by the Kansas City Automobile Club. Surely it was the hardest ever held over that part of the map. Eight days of it, totaling more than 900 miles, through rain, over hills, and a great part of the distance over the un-auto-explored roads of Oklahoma was unmistakably an endurance test in every sense of the word.

As described in last week's Motor World 31 cars left Kansas City on September 19th, and before the first day's run ended six had dropped from the perfect score division. The second day's run from Emporia to Wellington resulted in a loss of points for three more and the absolute elimination of two cars. But the following day, when the rain came, and when the cars had to plow through quicksand-bottomed lakes, that was the time when real men wept tears of anguish when they could not reach the controls on time. Ten perfect scores were left at the ending of the third day, when the cars got to Enid.

More mud was encountered in the fourth day's run from Enid to Oklahoma City on the 22d inst., and three cars fell by the wayside before they reached the night control. The luncheon station was at El Reno and one perfect score went down before that place was reached. J. F. Moriarity's Stevens-Duryea was the victim. Moriarity rolled up to the control two hours ahead of time, but just before he reached the line his engine stopped for want of gasolene. Realizing that no engine will run without gasolene to help it along the driver rushed into a grovery store, grabbed a quart measure, filled it before the astonished clerk could recover from his surprise, and hastened back to his car. It was quick work, but it cost four precious minutes. The cars that finished at Oklahoma without marks against them were the Chalmers-Detroit, Corbin, Moon, Ford, Rambler and two of the Maxwells.

Rough roads and mudholes were the features of the trip from Oklahoma City to Guthrie on Wednesday, 2d inst., and they chased the Moon car from the head of the class away down to the bottom. The next day brought one of the Maxwells down as well as the Ford.

When the cars checked in at Oloa, Kan., on Friday night, the 25th, there was only one driver who grinned broadly. He was Hargrave, for up to that point his car had not received a penalization, and, moreover, his was the only one that had not. A mud hole in the Flint hills was responsible for the dropping of Carl Simmons's Maxwell. The car ran over the hills nicely and coasted down into a mud hole that looked innocent until the party got into it. It proved to be of greater depth than Simmons estimated and required nearly two hours herculean work to extricate it. E. J. Anderson's Rambler fell from grace when the official inspector got after it at the finish of the day's run. The car survived the hard schedule, but at the expense of a broken fender bolt and a lost hub cap.

Driver D. B. Huss, of the little Brush runabout, was a victim of Good Samaritanism. After going out of his way to secure help for a disabled car containing a woman and child, he lost the course and arrived at the night control three hours late, and after the checkers had abandoned the post. For this he was later disqualified, though finishing on schedule with the others next day.

The little Chalmers-Detroit, which, up to that time had enjoyed company with the perfect scorers, also had a peck of trouble on the next to the last day. A tire gave way and while the occupants were looking at it another followed. That accounts for another failure to come in with a perfect score. Points were also lost by the Packard and the Stevens-Duryea when "hog backs" got in the way and the cars had to be dug out. A "hog back" it appears, is a grown up waterbreak, and like corn and girls and other nice things, they attain some size in Kansas.

Only one incident marred the otherwise perfect day, except for the mudholes and "razorbacks." That was the enterprising holdup of a Rock (Kan.) farmer, who said at the time that his name was Smith, but later changed it to Erickson. When the pilot car got to a point two miles from Rock, the bridge over a small creek was not in its accustomed place. The committeemen were wondering what to do when a young man rode up and offered to let them go through a field he said he **owned,** but reckoned it ought to be worth something to him. W. G. Coumbe entered into a verbal agreement with the young man to stay at the gate and direct the other cars properly, in consideration of which service Mr. Coumbe gave him $5.

Presently Moriarity's car came along.

"You cannot go through my field unless you pay me $2," said the young man left at the gate by the committee. "I've got a lot of choice cattle in there and they'll scare so much that it will bean a big loss to me." Moriarity asked the man his name and then insisted that "Smith" give areceipt for the insisted that "Smith" give a receipt for the $2.

The young man hesitated and then admitted that his name was not "Smith," but John Erickson, and he added:

"I own most of the land around here."

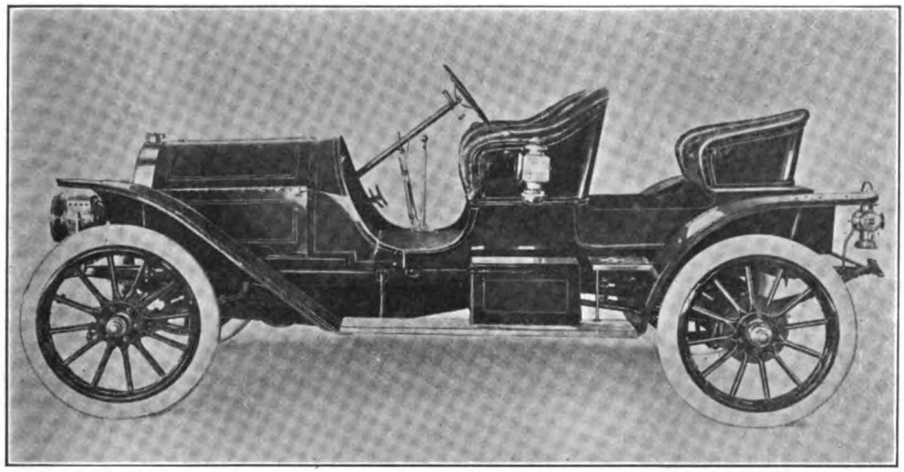
"Don't wonder at it," grumbled Moriarity as he tucked the receipt into his pocket and drove off.

Later reports at the night control showed that Erickson collected $51 from 22 contesting cars, one non-contestant and the pilot car.

The final day's run into Kansas City on Saturday was easy and enjoyable. Aching backs ached less as the goal drew nearer and there was not a driver who was not glad to see the last control. It was a success, they all agreed, but hoped next year's run would last only five days. Mrs. Kirkland's driving was a revelation to the seasoned man-veterans, for she finished smiling and well up with the leaders, though penalized.

An interesting point is that Hargrave's winning Corbin carried number "13" through the run. An unlucky number gets the only perfect score!

The list of the 21 contestants who completed the long and strenuous run, with the records made, is as follows:



Harry Hargrave, Corbin	1,000
E. J. Anderson, Rambler	994
F. L. Woodward, Knox	989
R. C. Greenlease, Cadillac	980
L. A. Robertson, Franklin	975
J. F. Moriarity, Stevens-Duryea	960
Mrs. Kirkland, Overland	952
Dudley Munger, Peerless	935
W. S. Hathaway, Maxwell	932
J. B. Porter, Chalmers-Detroit	921
C. M. Norris, Ford	919
E. P. Moriarity, Chalmers-Detroit	896
E. P. Moriarity, Packard	886
W. L. Walls, Studebaker	868
W. S. Hathaway, Maxwell	842
E. H. Jones, Maxwell	723
C. Muehlebach, Pope-Hartford	667
C. J. Simmons, Maxwell	479
C. B. Merrill, Moon	000
D. B. Huss, Brush	000
H. F. Worth, Buick	000

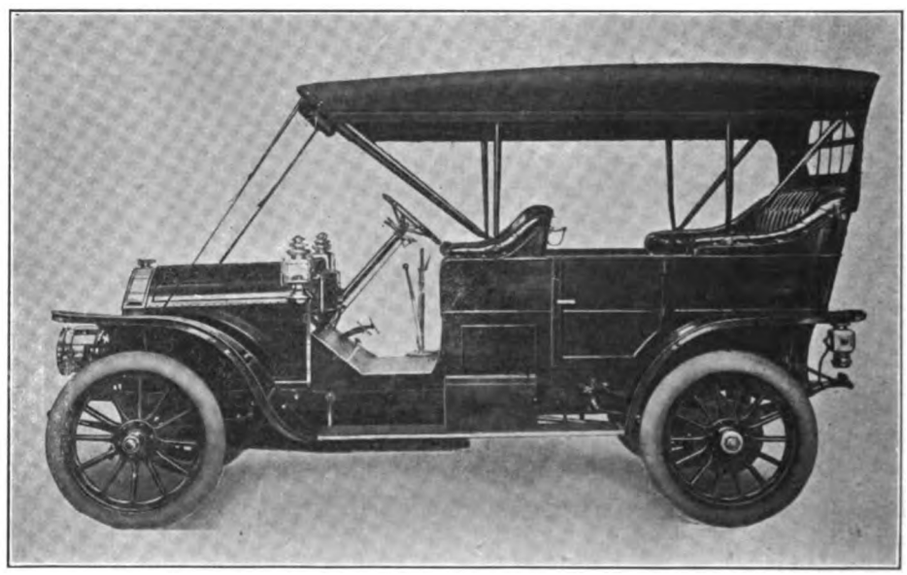
STODDARD-DAYTON OPTIONS BROAD

Models for 1909 Include Variety of Sizes, Uniform in Design and Construction—Noteworthy Changes in Detail.

In a remarkably pleasing application of the principle that the man who buys a car of modest price or small capacity does not by that token relinquish his requirement of all that current practice has deemed best in construction, the Dayton Motor Car Co. is offering as its 1909 line, no less than three different sizes of the same machine. That is to say, while three different types and powers of car are listed, their characteristics are absolutely uniform from the design and construction of the power plants to the outline of the bodies; the differences between them are only those of price, power and capacity. They also share the common benefit of being constructed entirely at the Dayton (Ohio) factory of the company where every component except wheels, carburetters and ignition apparatus are produced by approved and economical methods.



STODDARD-DAYTON "9 H" 25 HORSEPOWER

Beginning with the prefix "9," as indicating the year of production, the list includes models "F," "A" and "H." In addition, and distinguished from the "A" car by the purely runabout characteristics of wheel base and engine position with their attendant details, is model "C." Model "K" is the largest and is a modified form of the present Model "G," brought into the newly standardized form to correspond with the other machines of the line. The engine sizes range from 45 down to 25 horsepower, and the seating capacities vary according to the types of body employed. These are largely optional with the purchaser and comprise an unusually comprehensive offering to choose from. There are the plain, straight line bodies seating four, and in the larger models seven passengers, the "baby tonneau" types with low-backed rear seats of uniform delineation with the front seats, and roadster models with a variety of rumble accommodations. Thus the owner may select a plain box seat with artillery backs for two passengers, individual bucket seats, or the single seat which is more commonly seen in service. In any case, the interchangeable design of all the bodies makes it possible for any desired arrangement to be supplied on requisition, while the owner by the same token is enabled to alter the arrangement of his car at any time he may desire.

The mechanical construction of the cars remains the same in general layout as heretofore. The valve-in-the-head motor, with single rocker arm for actuating both valves is retained; the selective type change gear, shaft drive, and arrangement of control mechanism are unchanged in principle. A number of rather significant alterations in detail have been made, however, which are worthy of note.

Thus in the motor, the former copper jackets have been replaced with cast jackets, the cylinders now being formed in pairs, with large end plates for each twin casting, affording ample room for cleaning and finishing operations. The arrangement of the two-to-one and auxiliary driving gears has been changed somewhat, it now being possible to remove the gear case cover without disturbing the fan drive. The motor lubricating system has been improved also and now comprises a thoroughly effective and automatic method of drenching all bearing surfaces with a constant supply of oil. The lower part of the crank case is divided into two longitudinal compartments, the lower forming an oil-well, into which all overflow from the motor is drained through a suitable filter. From this point the supply is raised by a positive plunger pump driven from the cam shaft to a distributing manifold, whence it is taken by pipe leads to the feeding points. The arrangement of ducts and oil ways is such that by the assistance of centrifugal and rotary action the lubricant is carried to every inch of bearing surface in the motor. A noteworthy instance of this is the method taken of supplying the pillar on which the distributing mechanism for the ignition system is mounted. For this, a spiral groove in the driving shaft is employed to raise the oil to the commutator proper, while provision is made for the overflow to be returned to the case through an independent channel. In the case of the smaller motors the method of mounting in the chassis by means of channel steel cross arms, instead of integrally cast members, also is a creditable detail.

In the arrangement of the transmission, few changes have been made except in the method of actuating the change gear, in which the striking lever, instead of being mounted on the inside of the frame sill, as formerly, is now carried outside the frame in the more conventional position, a strengthening bracket-housing serving to protect and reinforce the attachment of the levers and rocker shafts. The transmission bearings also are made longer.

STODDARD-DAYTON "9 F" 45 HORSEPOWER

In the chassis construction, the frame

Digitized by Google

sills have been strengthened very materially, and the steering rod has been brought out to the right knuckle over instead of under the axle. In this way it is removed from the troublesome danger zone it formerly occupied. The wheels and brake drums have been increased in strength, while the side strut rods are now hinged to the frame instead of being given the former ball and socket connection.

In body construction, a metal sheathing has taken the place of the fabric covering for the wood laminations hitherto employed, making a more lasting and climate proof surface to receive the finish. The option offered in bodies, also is extended to the equipment, as for instance, in the case of the ignition system, where a choice is offered of four different types of magneto—U. & H., Bosch, Witherbee, and Splitdorf. In this way, while the machines themselves are absolutely uniform and standard in construction, regardles of size, the purchaser has the benefit of an unusually wide option in finish and fitting, which enables him to give as much scope to individual taste as may be desired.

Pet Cocks in Rear Axle Housings.

Thoughtful makers are accustomed to fitting pet cocks in the housings of rear axles of the live type in order to enable the operator to determine correctly the proper level at which the oil should stand in the bath. Where this has not been done originally, the owner may fit one for himself at slight expense. Too much oil in the casing involves a drenching of the wheels with the overflow. The evils of the opposite extreme are too obvious to need mention specifically. The happy medium, however, is sometimes difficult to attain without some such guide.

Caution in Refilling the Radiator.

Ordinarily there is no danger in refilling with cold water the radiator of a machine which has been running for some little time. In case the water level in the radiator is sufficiently low so that the tops of the cylinders are uncovered, however, it should be seen to that the motor is well cooled off before the water supply is replenished. Otherwise there is danger of cracking the cylinders at the exposed surface, owing to the contraction due to the rapid cooling effect of the sudden application of water at low temperature.

Putting New Rings in Worn Cylinders.

When putting new piston rings into a cylinder which is worn larger at the top than at the bottom, they should have very long halved or tongued ends, fitting rather closely together and loose enough to work perfectly free in the grooves. Unless these precautions are taken, there may be a tendency either to clog in the lower portion of the bore or to spring apart in the upper portion, thus causing undue leakage of gas.

NEW ELMORE FEATURES FOR 1909

Two Models to be Added to the Line—Improvements in Power Plant and Steering System.

With the rapid approach of the fall and winter season with its accompaniment of show dates, the specifications of new and forthcoming models appear with almost bewildering frequency. Notable among these are some of the details of the new Elmore models "44" and "33" which became known only recently. As a matter of course, the distinguishing feature of these machines—the two-cycle motor—will be continued, the three and four cylinder types being employed as in the two current models. In other respects the more important specifications will remain unaltered. Improvements of a more or less significant character have been made, however, which are worthy of note.

Thus in the motors, the use of the offset method of crank mounting makes its appearance, while the radiator size has been slightly increased, incidentally improving the general appearance of the machines, since it involves a bonnet some 1½ inches higher than before. As the frame has been lowered 2 inches, a new form of front axle has been adopted, while the addition of a new steering column also serves to alter the appearance of the machine somewhat. The motor controlling levers are arranged as heretofore, but the steering gear is changed to permit a wider steering lock than before, and to improve the control of the vehicle in the matter of readiness of response.

By altering the position of the actuating spring and placing it back of the cone, the design of the master clutch has been considerably improved. Similarly the design of the rear spring mounting has been improved by increasing the number of spring leaves in service, and reducing the thickness of the members, thus producing a more yielding and responsive mounting. At the same time the distinctiveness of the three-quarter platform system is retained. The tire sizes on the model "33" have been increased from those employed on the corresponding model current to 33 by 4 inches, the ½-inch increase in small diameter doing a great deal in the way of relieving the springs of the more arduous classes of work which it is called upon to perform.

Misleading Carburetter Symptoms.

A fruitful source of puzzling difficulty with many types of carburetter is the automatic intake valve employed to establish the proper dilution of the mixture at various speeds. When this is found to be working incorrectly the most natural inference is that the spring is improperly adjusted. That such is not always the case, but that a far simpler if less apparent difficulty may be at the root of the trouble, was the experience of a foreign motorist of no little self-assumed authority on such matters.

A couple of months after he had begun to drive his present car, as he relates, he found that it was developing an altogether too high rate of fuel consumption. The odor of the exhaust was offensive, and there was an occasional difficulty in starting.

"As I had been experimenting with lubricating oil," he says, "I saddled a brand of the latter with the cause of the foul exhaust. But that evidently did not explain everything, for on reverting to the oil which had previously given good results, there was only a trifling improvement. Deeper investigation failed to disclose anything beyond the evident fact that the mixture was too rich. The car is fitted with one of the best types of automatic air valve that I have seen, but, as we all know, automaticity in these matters is dependent on correct setting. I came to the concluson that the automatic valve was not responding to the call of the engine at low speeds, at least, because the controlling spring was too strong for the engine when pulling slowly. The diagnosis was correct, and substituting a weaker spring for the one in use, the trouble disappeared. . . . .

"The other day I was investigating a somewhat obscure effect, which showed that the two rear cylinders were missing when the engine was throttled down to the lowest point. When I came to dismount the vertical seating for the spring, I found that the plunger rod had no effect on it. It had jammed—which incidentally explained trouble I had had in starting up from cold, that had begun coincidentally with the spring readjustment referred to."

Clearing a Choked Carburetter Jet.

As has frequently been suggested, it is possible occasionally to remove the clogging obstacle from a choked carburetter jet merely by racing the engine. When the clogging is sufficient to cause the stoppage of the motor, however, this remedy appears to be out of the question. By injecting a few drops of gasolene into the cylinders and cranking, immediately opening the throttle to its full amount, tremendous suction is developed for the one or two cycles which may be secured in this way. One or two attempts made in this way often prove sufficient to pull the obstruction through the jet, thus clearing it without necessitating any dismounting of parts or loss of time.

When equipping a car with shock absorbers there is small danger of going astray if the maker's instructions are followed to the letter. In the subsequent readjustments of the equipment, however, there is room for considerable difficulty to be encountered unless great pains are taken to secure uniform adjustment of the braking action on the four corners of the chassis.

ELIMINATES STARTING DIFFICULTY

Novel Features in New Model of the Unterberg & Helme Magneto—How Uniform Current is Secured.

Because it entirely eliminates that ancient and sometimes justifiable objection to the use of such devices—the starting difficulty—the Unterberg & Helme magneto, for which J. S. Bretz Co., New York City, are the American importers, is entitled to special consideration. Although this instrument

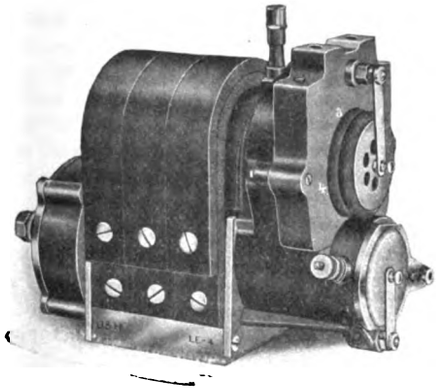

Fig. 1

has been on the American market for some little time and is already favorably known, a new model has just been brought over which embodies novelties in the arrangement of the interrupter and condenser as well as in minor details. Like the other types it possesses the remarkable feature of yielding a uniform current regardless of the rate of rotation of the armature between the slowest possible speed and the normal of ordinary service. Hence the starting

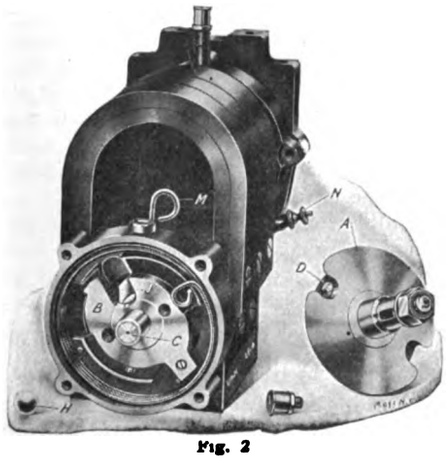

Fig. 2

spark is as powerful as that developed at normal speed and not only is the labor of cranking alleviated by this means, but any uncertainties due to imperfect gassification of the charges at low crank shaft speeds are done away with by virtue of the high rate of inflammation secured.

As will be seen from Fig. 1, there is little in the external appearance of the device to indicate its unusual features. It is of the pure high-tension type with both primary and secondary windings on the armature so that it is wholly self-contained. The driving and distributing mechanisms are disposed at opposite ends of the armature so that the electrical and mechanical connections are separated as widely as possible. The armature is mounted on ball bearings so that only semi-occasional oiling is required, and other provisions of like purpose serve to reduce the amount of necessary attention to a minimum.

The manner in which the strong spark is developed at low speeds is already more or less familiar as employed in the older types.

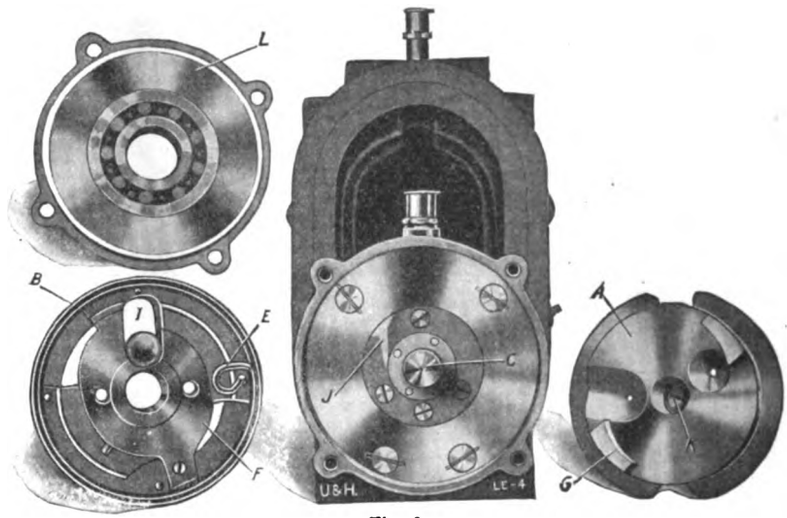

Fig. 3

The starting mechanism itself is shown in Fig. 2, which is an end view taken with the steel driving disc, A, removed from the armature shaft. The reverse of the disc also is shown in Fig. 3, as well as the cover plate, L, and a bronze disc, B, which is affixed to the armature shaft. A coil spring, one end of which is secured to B, and the other to a pin on disc, A, forms the permanent driving connection between the two. A pair of cam-shaped surfaces, F, on B, are held by the spring against two corresponding stops, G. Consequently the spring compels the disc, B, and so the armature to follow A when the latter is driven. At the same time the steel ball, H, which is carried loosely in the slot, I, projects behind B, and is pressed forward at a single point in each revolution by contact with a third cam surface, J, coming against the flat face of the disc, A. The cam, J, being stationary with the magneto frame, the movement of the disc, B, is at once arrested, while A, continues to turn, the ball rolling around in its slot and pressing against A. By this means the spring, E, is wound up until a radial depression in disc A, comes opposite the ball, when the latter is released by slipping into the depression, thereby escaping the cam, J, momentarily and releasing the armature. The armature is then driven forward by the spring tension, and at a rate entirely proportional to the strength of the spring. Its speed is thus greater than that

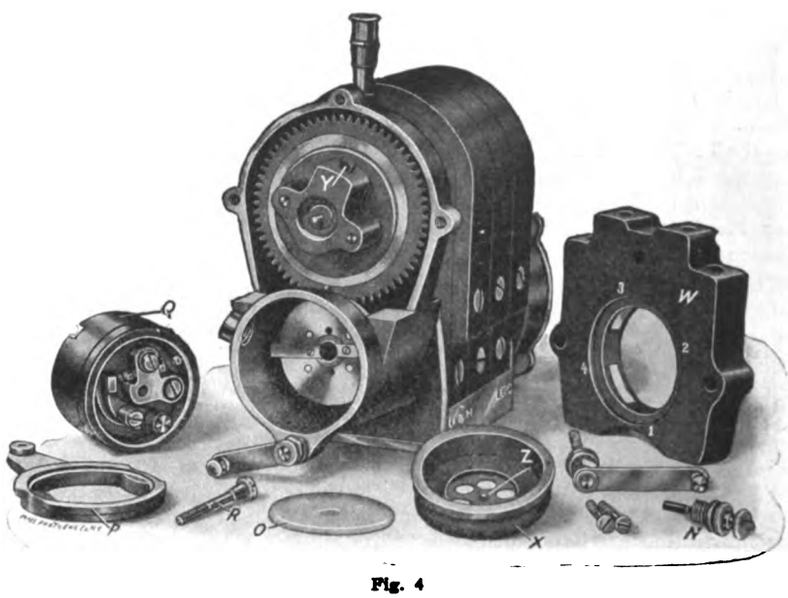

Fig. 4

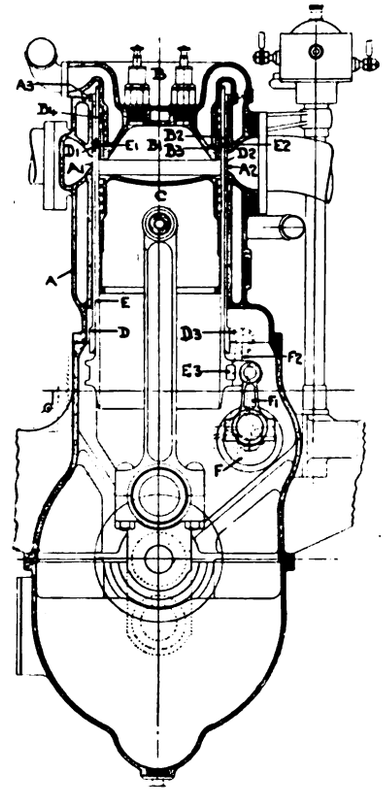
Digitized by Google

of the driving disc by an amount which is determined by the designer. As soon as surfaces F and G are re-engaged, the armature is again arrested until released in the manner described.

This arrangement serves to procure a relatively high rate of rotation for the armature during the zone of maximum current generation absolutely independent of the speed of the driving mechanism. At speeds upwards of 60 revolutions per minute, when the momentary acceleration is no longer required, the ball is driven radially outward by centrifugal force coming to rest at the outer end of the slot, I. The driving and driven parts are then locked together and remain so until the speed again falls below the rate of efiective current production. A further point to be observed is that the armature is invariably released at a point to be observed is that the armature is invariably released at a fixed point which is independent of the position given the interrupter by the spark lever.

A dissected view of the electrical end of the magneto is shown in Fig. 4, in which N is the ground connection to the switch; O, the cover plate over the interrupter; P the ring carrying the interrupter cams, and Q the interrupter housing. The latter is held in place by means of the central screw, R. The action of interruption is brought about by contact between a circular fiber contact finger on the end of the interrupter arm and the cam faces on the interior of the ring, P. The contact, although circular, does not revolve, consequently there is no danger of unequal timing through irregular wear. For the same reason the cam surfaces are of hardened steel—the combination of steel to fiber producing no effect on the stationary members.



The condenser is enclosed in a ring which is set into the back of the interrupter housing and retained by a threaded disc. The molded insulation of the distributor, shown at W, has four contacts embedded in it, against which the carbon brush, Y, wipes. The former is held in place by three screws. The safety spark gap consists of a metal point, connected to Y, from which the spark jumps to the point Z in the housing, X. A mica window in X permits the spark to be seen without risk of exploding gasolene vapor. A turn of the spring clip seen permits X to be removed, thus permitting exposure of the distributor for the purpose of cleaning.

Another illustration of the care observed in providing for the convenience of the operator is revealed in the method of timing. In Fig. 2, is shown the timing pin, M, by which the armature is located in its proper position for firing. This operation is accomplished in a moment without removing any of the parts of the magneto. The fly wheel is turned until one of the pistons is in its earliest firing position. The armature is located by the pin M, and the magneto is then coupled to the engine in the position thus indicated.

DAIMLER'S "SENSATION" AMERICAN

New Engine Developed from a Chicago Inventor's Device—He Co-operates in Modifying the Design.

Considerable stir is being created in England, and to a less degree on the Continent as well, over the introduction of a modified form of the Silent Knight engine, which first made its appearance in Chicago several years ago, where it later appeared in the car of the same name made by Knight & Kilbourne. As told by the Motor World

two weeks ago, the English Daimler Co. have had in view for a year and more the introduction of a new motor of this general type, although it was not known until recently how closely the Knight patents had been followed. It now appears that the inventor himself has been working in conjunction with the Daimler engineers for many months, and that the resulting modification of his original engine is to be used in the Daimler cars for 1909. Further, it is reported that the Panhard works are already experimenting with the motor and that the makers of the Belgian Minerva car have already taken it up, while representatives of the F. I. A. T. concern, have come from Italy to watch the experiments in France.

Unlike the motor already known in this country, the more recent development is made without the auxiliary exhaust port at the base of the cylinder. Also it is altered in one or two other, though less significant respects. Its construction, which is extremely radical, is shown in the accompanying illustration, the manner in which two sliding, cylindrical valve sleeves have been made to replace the usual poppet valves being perfectly apparent.

In place of the ordinary type of cylinder, a plain casting with independent head is employed, the upper end being closed by a head carrying a piston-like extension, B, which projects slightly into the combustion chamber, forming a pocket around the circumference for the reception of the upper ends of the two sleeves, D and E. These are interposed between the piston and the cylinder wall, being driven from the eccentric shaft, F, which replaces the ordinary cam shaft. Two radial ports are cut in each of the sleeves at proportionate distances from the top, and in such a position that at certain points in the cycle those on either side may register with the wall ports in the cylinder proper, which are used in the distribution of the gases. The actuation of the two sleeves is such that the ordinary operations of the four-stroke cycle may be accomplished as in the regular type of motor in common use.

Among the advantages claimed for the system are, first of all, silence in action, since there are no spring-actuated parts, and no tappets—all the moving parts being in constant, instead of intermittent motion. In addition to this, the valve opening being accomplished by a differential movement of the two sleeves, it is possible to obtain a very quick opening and closing action, which further, is under perfect control. The upper ends of the sleeves sinking into the circular well betwen the cylinder head and the false head which projects from it, form at the point of highest compression and explosion pressures in the cycle, a very tight and restricted combustion chamber. Improved methods of lubrication are thought to have overcome any possible objection which may have existed on the score of engine friction.

The Daimler Co. has in preparation no less than three different models of the engine, at 22, 38 and 48 horsepower, respectively. Tests made with the new models are said to have demonstrated an unusually high development of power for the piston displacement, as well as remarkable smoothness of torque at low speeds and heavy loads.

The Cause of Uneven Brake Wear.

When improperly hardened or when composed of poor grades of metal the cams which are so commonly employed for applying internal expanding brakes are likely to wear unevenly. The same difficulty also occurs sometimes with the shoes of this type of brake. The result in either case is that the braking action is distributed unevenly over the drum and the retarding action is irregular and uncertain. This is an inherent difficulty with this type of brake which is only to be remedied by the exercise of great care in selecting the materials.

COMMERCIAL VEHICLE PROBLEMS

Electrics for Cities and Gasolene for Country Roads, Says Churchward—Analysis of the Relative Conditions.

In contrasting the relative performances of electric and gasolene driven vehicles, particularly of the commercial variety it is customary to compare their characteristics without regard to the idea that properly they may be constituted to perform totally different classes of service. Thus for obvious reasons the electric stands at a disadvantage as compared with the gasolene machine for work involving long hauls over very hard roads, and simiiarly the smooth action and economical performance of the electric makes it as well if not even better suited for purely city transportation. Alex. Churchward, whose investigations of motor vehicle problems have already been brought to notice more than once in these columns, forecasts an even wider field of usefulness for the electric vehicle than that prescribed by these limits. So soon as the commercial vehicle user shall have awakened to the need of handling the problem of highway transportation on a purely engineering basis, questions of economy are bound to be more carefully considered.

"When comparing the operation of motor driven and horse drawn vehicles, a great deal of prejudice is frequently shown against the former, much of which is well founded, and when we come to analyze the reasons for this prejudice we can hardly blame those who have entertained objections and do make adverse criticisms," remarks Mr. Churchward. "In the early days, and even now in some cases, the purchaser was at the mercy of the glib tongued salesman, whose only aim was to sell the vehicle and pocket his commission, regardless of whether the vehicle was suited to his client's requirements or capable of performing the particular service required. In other words, the salesman promised and all but guaranteed that the vehicle would fill all the requirements of the purchaser. While this purchaser would not buy an electric light or steam plant offhand, but would call in an accredited consulting engineer and have his plans and specifications properly drawn up to suit his requirements, where the purchase of a motor vehicle is contemplated no such process is usually followed, and the most clever and persistent salesman or the lowest price frequently gets the order.

"The evil results of this system, or rather lack of system, are to be seen to-day on our streets, and some time will be required to overcome this prejudice and convince the present large users of the horse-drawn vehicles that a properly selected motor vehicle will be economical, reliable and perform the required service better, quicker and cheaper than their horse-drawn vehicles at present do.

"To-day the leading electrical manufacturing companies will not sell railway motors to a customer unless they know the exact duty of the service on a known road bed. How much more necessary it must therefore be to know the exact conditions of service, where the tractive effort due to road bed alone may vary 1,000 per cent. is obvious.

"Not until this matter is handled in a proper engineering manner will the motor driven vehicle be a genuine commercial success. The day of employing motor driven vehicles, chiefly for advertising purposes, has gone by; the advantages to be gained by the use of such vehicles has been fully demonstrated on a basis of utility and service and the prospective purchaser must and may be shown that there will be a real and tangible saving.

"It must be granted, therefore, that the day will soon come when motor propelled vehicles will be installed and properly selected and then the question at once arises: Which will be the most economical power to use, gasolene or electricity? Each has its own particular field and cannot be ousted by the other—if properly chosen and cared for.

"For cities having well paved streets and not too hilly, and the distance per day to be covered not over 40 miles, the electric delivery wagon will always make a good showing against the gasolene vehicle of the same capacity.

"First. Because of ease of control.

"Second. Rapid acceleration without jerking or straining the mechanism.

"Third. When vehicle is stopped all fuel consumption ceases.

"Fourth. No noise or odor.

"Fifth. Lower maintenance and upkeep on tires due to better and more even acceleration.

Sixth. Lower maintenance of the running gear because of its lower limits of speed.

"Seventh. No jarring or shock when changing speeds.

Eighth. Less cost per net ton mile for fuel, i. e., current against gasolene.

"In England the storage battery companies are now ready to contract to maintain vehicle batteries at so much per mile, and I predict that before long the same state of affairs will exist here. When this does take place the two great items of expense, batteries and tires, will be put on a known basis of so much per mile.

"The expense of charging vehicle batteries from electric light circuits does not cut much figure in cost of operation or cost per ton mile. An electric delivery wagon of standard make will not cost more to operate when charged from city circuits than a similar capacity gasoline vehicle. In other words, the cost of electricity per net ton mile is not more than the cost of gasolene per net ton mile at the present average current prices. The electric vehicle can be kept in any stable or garage in the heart of the city without any extra insurance, while the gasolene vehicle must have special accommodations.

"The maintenance of the battery on the electric vehicle is to-day no more than that of the engine and gear changing device on the gasolene rig. And again, to get low maintenance and maximum economy from a gasolene vehicle it is necessary to employ a higher priced driver than with the simpler electric. The electric motor and controller installed in the modern vehicle has been so far perfected that the maintenance is practically nil.

"Therefore, the comparison at present for city work is between the upkeep of the storage battery against that of the engine, change gears and their accessories, and after all is said and done, results will be found in favor of the storage battery, providing it is properly charged and inspected and the work it is called upon to do is not outside of its proper limitations.

"For suburban service, poor roads and long hauls, the gasolene delivery wagon is superior and will show great economy over both the electric and horse-drawn vehicle, provided it has been properly selected for the work it has to perform. Up to 3½ tons net load the electric is most suited for city work and even to 5 tons where the run is not too long. For suburban work and greater loads the combined gasolene electric will surely compete favorably with the straight gasolene vehicle.

"This is apparent for the following reasons:

"First. Perfect control under any condition.

"Second. No gears to change.

"Third. Impossible to stall engine due to overload or starting too quickly on bad roads. The system is so designed that as heavy road or grades are encountered the torque is automatically increased and speed decreased up to full capacity of engine.

"Fourth. Only one control pedal or lever.

"Fifth. The efficiency of the electric transmission due to its flexibility as high as any form of change gears.

"Sixth. Smooth acceleration from standstill to full speed."

Adjustment for Automobile Lubrication.

In caring for motors which are lubricated by the simple splash method from the crank pit, it should be borne in mind that the entire success of the operation depends upon the adjustment of the oil level within a very limited range. The total variation between the correct amount and either too much or too little probably is not over 5 per cent. of the total quantity. When it is considered that in many machines the crank case capacity is not over 1½ quarts, the need of delicate manipulation in filling is at once apparent. It is chiefly because of this embarrassing feature of the simple system that the more complicated methods of automatic lubrication are justifiable.

ALL AROUND VIEWS ON GOOD ROADS

Motorists and Grangers Meet Experts in Convention at Atlantic City—Broad Discussion of Highway Problems.

Behind the steering wheel and from the side of the road are entirely different points of view so far as motor cars are concerned. Hence, perhaps, not the least beneficial effect following the New Jersey good roads convention called at Atlantic City, N. J., on Friday and Saturday, 25 and 26th uit., is that the "freeholders" who attended came into friendly contact with many members of the automobile clubs and because of the motor car riding which the automobilists were liberal in providing for them are now greatly modified in their antagonism toward the machines. For the first time, perhaps, some of them have had a view of how matters look to the owner of a car.

Riot and bloodshed at the convention were sidetracked in advance by a truce arranged between the Associated Automobile Clubs of New Jersey, the State Farmers' Grange, and the Boards of Freeholders, to the effect that all subjects relating to speed laws and the like should be ruled out and the meeting confine itself strictly to the actual construction, engineering and financial problems involved in State highway improvement. Although many of those participating in the proceedings were bursting to speak their minds either against the motorists or the constabulary, as the case might be, the screws were clamped down close by the chair in every instance, and peace prevailed.

With long-headed policy, a lot of the automobilists arranged to take to Atlantic City in their machines as many farmer and freeholder delegates as their cars would hold. Not only the saving in railroad fare but the prospective pleasures of the trip inclined to a ready acceptance of such invitations, and the ride opened the eyes of the passengers as to the ease with which an automobile is steered and controlled. They also say that speeds which to the man on the roadside looked reckless, are a slow unfolding of the highway ahead to the motorist. After passing through seven counties and touching widely separated towns in order to pick up delegates, W. C. Crosby, chairman of the convention committee and acting president of the Associated Automobile Clubs of New Jersey, was able to give those in his car a demonstration of how "Jersey justice" is administered, as he was stopped by a constable about 40 miles from Atlantic City and charged with going in excess of 30 miles an hour. Everybody in the car knew the absurdity of the charge, but the justice before whom the case was taken refused even to allow Crosby to plead, and summarily pronounced him guilty. The motorist entered an appeal and continued his trip, letting his passengers draw their own lesson from the incident.

Busy agents for dust preventatives and patent surfaces for highways found plenty of people to work on and to give demonstrations to, as the convention was attended by members of the Associated Automobile Clubs, which isued the first call for it, and by representatives of the New Jersey farmer and freeholder interests, together with county engineers and good roads experts from many places. Governor Fort was ill, and could not come as he had promised to do, but his speech was read by Col. Frederick Gilkyson, State commissioner of public highways. From Washington, representing the Federal Government, A. S. Cushman, director of public roads, attended, and New York State contributed a paper by State Engineer Skene, which was read by George C. Diehl, county engineer of Buffalo.

In addition to booming the scheme for the ocean boulevard, from Cape May to the Atlantic Highlands and New York City, Governor Fort's speech at the opening session pointed out that 1,350 miles of New Jersey road have been built with State aid and 432 without it, and that the problem of maintaining these roads is going to be a big one, inasmuch as it will cost about $300 per mile to keep them in condition after they wear down a little more. The annual expense involved for repairs alone would therefore be about $261,000, he declared, two-thirds of which amount is now paid by the registration fees of automobile owners. He urged the early abolishment of tolls on the few remaining toll roads in the State and suggested that something a little more yielding to horses' feet than macadam be used in future road construction.

During the afternoon session the following addresses were made: "From the Grangers' Viewpoint," by G. W. F. Gaunt, master of the New Jersey State Grange. "From the Road Drivers' Viewpoint," by James M. Beldon, secretary of the Essex County Road Drivers' Association. "Good Roads from the Standpoint of the Dweller Along the Way," by Frank Bergen, Elizabeth. "From the Automobilists' Viewpoint." by J. B. R. Smith, New Jersey Commissioner of Motor Vehicles. "From the Citizens' Standpoint, the Relation of the User of the Highway," by Judge W. H. Spear, Jersey city. Friday night the delegates were entertained by the Atlantic City Automobile Club with a beefsteak dinner at one of the hotels, the "doings" being heralded as "A Night in the Kitchen."

At the closing session on Saturday, further speeches and discussions were the order of the proceedings, after which the committee on resolutions undertook its duty of crystalizing in black and white the general sentiments and results. Their labors as approved by the convention effected a set of resolutions commending the aims and purposes of the gathering in assisting the good roads movement and providing for an annual convention in the interest of good roads, to be held under the direction of the Associated Automobile Clubs of New Jersey. Although the discussion of legal matters relating to automobiles had been barred from the convention speeches or discussion, the prevailing sentiment favoring modifications in the present stringent New Jersey automobile law found expression in a resolution to that effect.

Incidental to the serious business, the possibilities for seaside frivolities and entertainment which Atlantic City offers were fully explored, the gaiety of the resort having as yet in nowise abated. The 200 automobiles used by the members of the motoring fraternity in bringing themselves and a good share of the non-motoring delegates to the convention were kept busy all the time in the service of the ladies.

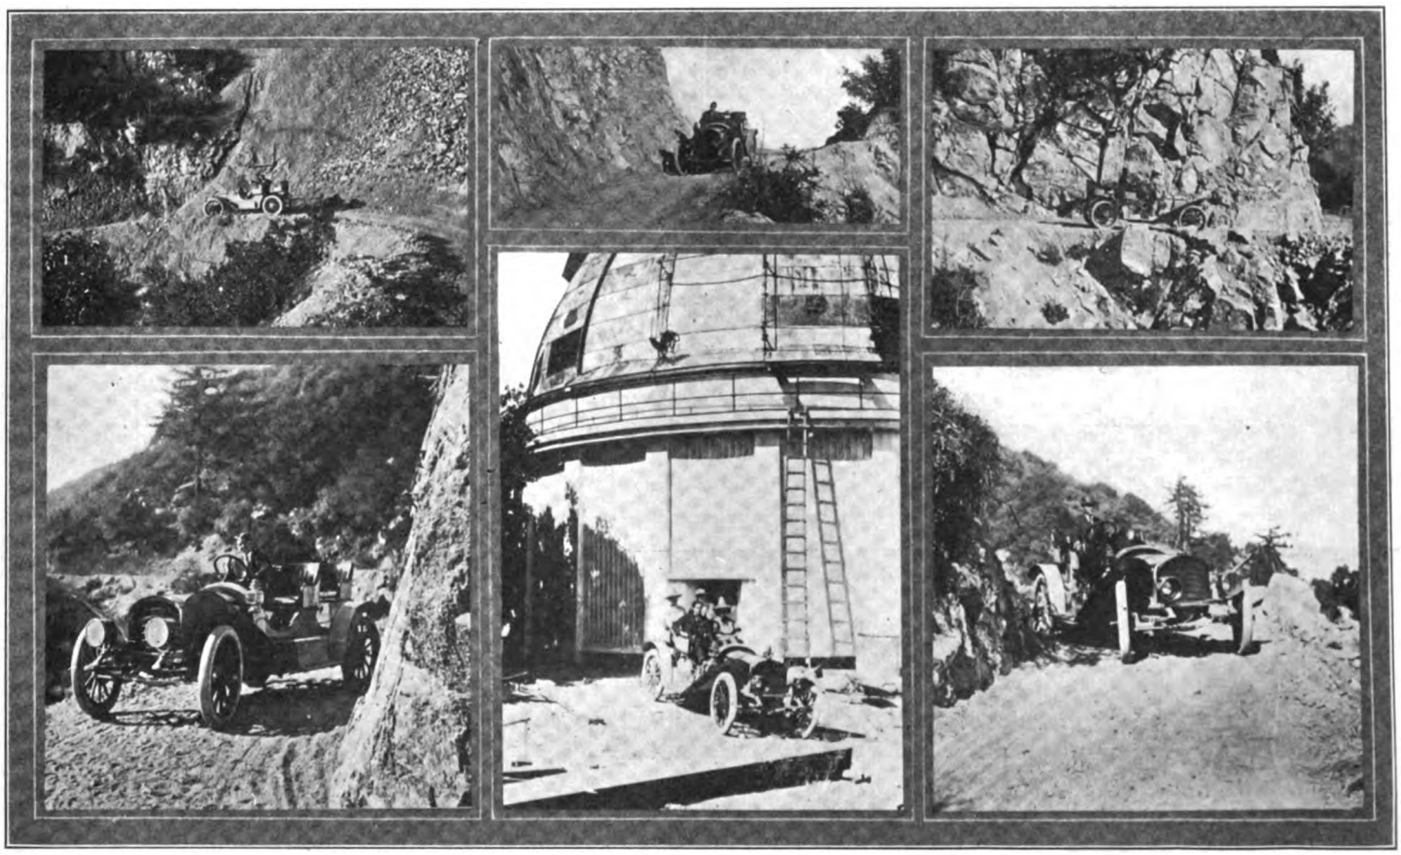
Big Loss Caused by Poor Roads.

That $3,000,000 is lost daily in the United States because of poor roads is the statement by which Samuel Hill, the well known road expert of Seattle, Wash., sums up the constant waste and expense that lack of properly built highways impose upon those who have to haul loads in the rural districts. On his way to the First International Congress of Road Builders, which is to be held in Paris for two weeks following October 11, Hill stopped over in New York City a few days, before taking ship, and talked freely about road matters. He advocates the use of convict labor by the states, and thinks that the Federal government should be much more liberal in making appropriations for the assistance of districts desiring improved highways. At Paris he will tell of the very successful and satisfactory roads constructed in the State of Washington by the use of cube rocks of graduated sizes, melted tar and fine pebbles.

Good Roads Enthusiasm in California.

By proposing a special bond issue of $18,000,000 for the construction of two great highways in California to join the county seats of all the counties in the State, Governor Gillett has secured the good will of all local good roads advocates all over the territory. At a good roads congress held in Sacramento on the 19th ult., 82 delegates, representing 11 counties, rose up en masse and called him blessed. A long list of addresses were delivered concerning various phases of road financing and building, and technical men representing the counties, the State and Federal government, gave the convention the results of their investigations.

To Raise Road Building Fund.



So desirous are the members of the Scranton (Pa.) Automobile Association that a State road be built over the Poconos toward Stroudsburg, Pa., that they have undertaken to raise $6,000 to assist the townships along the line. With such a financial lift, the farmers and the residents of the small towns are expected to go into the movement with enthusiasm.

AUTOMOBILE FOR SKY EXPLORERS

Mount Wilson Observatory to Have Motor Car Service—Successful Rambler Test on Zigzag Mountain Road.

Not long ago, a public spirited citizen of a western village wired Andrew Carnegie: "Can you please furnish our town with a jail?" Upon another occasion, a librarian is said to have written the eminent steel magnate: "Could you kindly furnish our Carnegie library with an automobile?"

VIEWS SHOWING RAMBLER CLIMBING THE CROOKED ROAD UP MOUNT WILSON

It is understood that these modest requests were not fulfilled. Nevertheless, the automobile is destined to play an important part in the scientific work to be accomplished by the Carnegie Institute of Washington in the big observatory now being erected on the top of Mount Wilson, 14 miles from Pasadena, Cal. Professor Ritchey, superintendent of the Carnegie Institute, who is in charge of the work of building the huge 60-inch telescope, has during the past year been facing quite a problem in connection with the erection of the large observatory. The distance from the Pasadena workshops to the top of the mountain is nine miles, and Professor Ritchey and other astronomers have to make frequent trips to the summit. Formerly they walked up, thereby consuming a great deal of time, so during the past year they built a road at a cost of several thousand dollars. This has a rise of 5,200 feet in the nine miles over which it extends, and skirts the edge of the mountain, with many short turns and dangerous inclines, some grades being as great as 25 per cent.

It occurred to Professor Ritchey and his associates that a great deal of time could be saved by using an automobile that could negotiate the grade—provided such a one could be found. The matter was taken up with W. K. Cowan, Los Angeles, representative of Thos. B. Jeffery & Co., and a Rambler car was furnished for a test trip to the top of the mountain.

The ascent was made in 1 hour and 15 minutes, most of the climb being made on the intermediate gear. Many of the turns were so short that the car had to be backed once or twice in order to make the turn safely.

The success of the test was such as to convince Professor Ritchey of the adaptability of the automobile to such strenuous hill climbing, thus saving a great deal of time and making it possible for necessary supplies to be transported to the top of the mountain, without difficulty. The elimination of the necessity for physical exertion on the part of the members of the astronomical staff is in itself a matter of much importance.

This is the second astromomical station in California to receive the benefit of motor car transportation. An automobile stage line was started in operation about two months ago, running up Mt. Hamilton to the famous Lick Observatory, near San Jose.

Automobile Line Planned for Mt. Desert.

A new and strategic development of the conflict between the pro-exclusionists and non-exclusionists of the automobile from Bar Harbor was brought to light late last week when it was discovered that a syndicate had purchased the Green Mountain road, one of the most beautiful and exclusive pleasure drives on the island and proposed converting it into an automobile route up which sight-seeing cars would be driven for the purpose of giving the public the benefit of the abundant views. Just who is back of the plan and what further extension of it may be contemplated has not as yet been learned. It is known that a thorough reconstruction of the road will be untertaken before another season opens, however, so that the business of automobile transportation may go merrily forward as soon as the season permits. Just what means the summer residents will take to further block the use of motor cars on the island remains to be seen, but it is known that they are by no means idle, and next summer undoubtedly will witness active renewal of the merry war.

PRIZE ARGUMENTS FOR SALESMEN

Jeffery Institutes Odd but Practical Contest —Ten Planks in Rambler Selling Platform Prize Winners Produce.

It is part of the trade of salesmanship to have the advantages of the product from the manufacturing, marketing and utility points of view condensed and studied to a degree where they form a part of every sentence spoken and every action carried out. It is not always, however, that the manufacturer or dealer is able to modify his selling platform as it were, nor to gather about him assistants of the sort who would be able to make the most advantageous use of such a platform did it exist. On this account, competitions organized by and within selling organizations to determine the most telling arguments to be used, in carrying or suppressing opposition, are at once interesting and instructive. A case in point is the recent contest instituted by Thomas B. Jeffery & Co., in an effort to bring out the best reasons why it is most advantageous for a dealer to engage in the sale of the Rambler car.

No less than 217 experienced and successful Rambler dealers grasped the opportunity of bidding for a share in the $125 prize distribution. Ten men, each of whom has been identified with the company for many years, served in the judiciary capacity. Needless to say the contest was productive of a host of useful and suggestive ideas.

J. F. St. Clair, Concordia, Kansas, won the first prize of $50. Miss Ella J. Brown, who, as secretary of the Coit Automobile Co., Omaha, Neb., has helped manage a $300,000 business during the past year, was awarded the second prize of $25, while L. G. Martin, Pittsburg, Pa., drew third prize, and I. R. Campbell, Des Moines, Iowa, fourth.

The ten best reasons ultimately chosen are as follows:

"The goods—the quality of the Rambler product.

"The reputation and stability of the company.

"The factory—the largest and most complete of its kind.

"The advertising—the most extensive and effective done by any manufacturer.

"The sales helps—the system of answering the inquiries of all prospective customers by personal letter without cost to the dealers.

"The interchangeability of parts and quick service in supplying came.

"Prices of parts—one-half to two-thirds lower than those of any other car.

"Fourteen thousand satisfied users—every one helping the dealer to sell Ramblers.

"Fourteen thousand cars in use—not a single one out of commission.

"The policy of the company—fair prices, best product, fair treatment."

Wagon with Detachable Power Plant.

Users of business vehicles of the self-propelled type are probably in a good position to appreciate the "strong" feature of the new Grabowsky power wagon, which is the quick detachable power plant. Instead of the more conventional arrangement of parts, the entire motor and change gear group is mounted on the two side rails of the sub-frame in such a way that by loosening a couple of bolts and casting off a half dozen minor connections, the entire aggregation may be drawn forward and out of the machine. In this way it is possible to replace the engine with a fresh one in a few moments, or to perform some trifling repair under the most advantageous circumstances, without delay and without having to resort to acrobatic contortions. This feature, as well as numerous others peculiar to the line are described and illustrated in the new catalogue the Grabowsky Power Wagon Co., Detroit, Mich., have issued.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

Long Island Motor Parkway Sweepstakes

SATURDAY, OCTOBER 10.
Starting at 9 A. M. Leading makes of cars to compete. $5,000 in prizes—cash or plate.

William K. Vanderbilt, Jr. Cnp Race

SATURDAY, OCTOBER 24.
Starting at daylight. American and foreign contestants. Speed. Endurance. Crack drivers.

Fastest course in the world, including 11 miles of cement parkway. Boxes, seats, parking spaces, at 437 Fifth Avenue, Telephone 5293—38th St., New York City.

The Vanderbilt Cup Commission.

DECALOG OF THE STORAGE BATTERY

Weiss Formulates Ten Precepts for Its Care —Methods for Testing and Regulating Its Condition.

Because the early training of the average motorist was almost wholly in the use of dry batteries for ignition purposes there is a very general tendency to neglect accumulators when applied to this use. This tendency is further accentuated in cases where double ignition is provided for, by the fact that the batteries are seldom called into requisition. Hence the best possible results are seldom attained. On this account, the watchful Technical Committee of the Long Island Automobile Club has been moved to issue a decalog of storage battery precepts which, because of their concise and comprehensive nature should be studied by every user as well as by those whose duty it becomes at times to instruct the novice in the care of his new machine.

"Although a storage battery is a somewhat delicate apparatus and easily spoiled," says the committee through its chairman, Louis T. Weiss, "yet ordinary care, and a rigid adherence to a few simple rules will keep the cells well and healthy so that the expert or doctor will not be needed during the greater part of their useful life." The Ten Commandments for the battery user, are as follows:

First. The first necessity is cleanliness. There are exceptionally few cases to be observed where cleanliness is apparent. There is nothing that more easily provides and causes a leakage of the current, than accumulation of dust and many other kindred types of matter. When such are permitted to remain on the top of the cells they become saturated with the moisture which inadvertently sprays from the cells or cells while charging, and thus form an excellent by-pass from positive to negative terminals, and in a very short time entirely empties the battery.

Again, this moisture is permitted to attack the terminals of the battery, and these being generally made of brass or similar metal are easily attacked and corroded so that they are immovable, and sometimes entirely enveloped by a heavy coasting of blue crystals of sulphate of copper. This salt is readily soluble in water and acids, and if allowed to get into the electrolyte of the battery, is fatal to its life. Yet how often is this salt washed off with water, or removed by other methods, and allowed to fall into the cells? It is well to keep the terminals coated with vaseline or thick grease and so prevent corrosion. Just a few minutes, say once a week, will suffice to clean up a battery, and so comply with that first and most necessary rule.

Second. Always keep the plates covered with their electrolyte, or acid, because if they are exposed or out of the liquid a sulphation occurs of such a nature as to damage the plates irreparably, besides which that exposed surfaces is inactive and useless.

Third. Never add sulphuric acid to the cells to compensate loss, unless such loss has been caused by a spilling of the acid, and then first ascertain the specific gravity of the acid remaining in the cells and make up with diluted acid of the corresponding specific gravity till the plates are again covered. In all cases of adding to, or compensating evaporation losses (except as above stated) nothing should be used but pure, distilled water, and absolutely pure and clean acid. A healthy battery used continuously, should not require any addition of acid more than once a year, but will probably require pure water at least once a week, if not more often.

Fourth. Provide yourself with a hydrometer to enable you to test your electrolyte and acids periodically, and you will avoid a great deal of trouble.

It may be said that the condition of the specific gravity is the pulse of the cell, and certainly it is the one means of ascertaining the condition of health of the cell or battery; like one's pulse, which enables the doctor to tell you whether you are well or not.

Let us suppose that the specific gravity of the electrolyte as given by the maker of the battery to be maintained at 1.250 degrees, at a temperature of 60 degrees Fahrenheit, when fully charged and cell in thorough working condition. Then apply the following:

At the end of the complete discharge the specific gravity will read somewhere about 1.150 degrees. If only half discharged, then about 1.200 degrees. If only one-quarter, 1.225 degrees, or three-quarters, 1.175 degrees, so that one may arrange a scale whereby the amount of charge used, or that remaining in the cells, may be estimated.

On re-charging, the specific gravity will rise from its reading of 1.150 or whatever it may be, to that of 1.250 again, thereby indicating the cell has received its full charge. In cases where the specific gravity will not show any rise during or at the end of its charge, it indicates a short circuit, and the cell has not received its charge.

In cases where the specific gravity comes up to 1.250 at the end of its charge, but falls to a lower figure during a period of idleness or standing for say 24 to 48 hours, this also indicates a short circuit, or else local action (or internal discharge), due to contamination of the electrolyte by some impurity.

Fifth. Never, on any account, discharge your battery below 1.8 volts per cell, because it develops a condition of chemical natures that is not easily remedied. To ascertain this it is necessary to have a small pocket voltmeter, reading from say 0 to 3 volts. These are also very inexpensive and will, if used, greatly prolong the life of your battery by helping you to know when the battery has fulfilled its functions. It is the greatest defect that a battery has, that it cannot give warning, groan, or in some way protest against being overworked.

The normal voltage of the storage battery is 2.0 per cell when doing no work, which is, if the electrolyte be 1.250 specific gravity, usually raised to about 2.10 volts. The storage battery, unless worked below 1.80 volts, has a recuperative power of rising from 1.80 volts to the normal of 2.10 volts within a few minutes after the discharge current has been discontinued. Unless a current is passing of say one-half of one ampere, the voltmeter reading is useless.

Sixth. Never adopt the method of putting a wire across the positive and negative terminals to see if there is any "spark." It is almost a dead short circuit, and if the cell be of a small capacity of say, thirty ampere hours, and the wire No. 16 copper, the current passing may be anything from 30 to 100 amperes for a fraction of time, which, when calculated is a very appreciable amount of the total capacity. It is also very detrimental to the cell in assisting the disintegration of the plates or active material thereon.

Seventh. Never be tempted to try everybody's advice upon any defect if it is serious but get good advice at once from a reliable source. Hardly two persons have the same experience or the same conditions, and what another did satisfactorily may be very unsatisfactory for you to do.

Eighth. Never allow the cells to stand in a discharged condition, as it becomes very difficult to get them properly charged if left standing any length of time, unless great care is taken during the succeeding charge.

Ninth. Do not forget that the discharge current of the battery may be affected by the adjustment of the trembler of the sparking coil. The current rate of the discharge should be about one-half an ampere, but a badly adjusted coil may take as much as 3 or even more amperes, thus eating up the energy of the cells, in ampere hours, in one-sixth of the time. Thus a 30 ampere-hour cell discharging at one-half an ampere will last 60 hours, but discharging at 3 amperes will last only about 8 or 9 hours.

Tenth. Although, as before stated, the storage battery is a more or less delicate apparatus, yet if only one-tenth of the attention given to the mechanical parts of the car be bestowed on the battery it will be found to be a wonderfully robust and reliable apparatus. But if neglected entirely and left to attend to itself, or do the best it can for itself, it will be found to arrive very soon at a condition of disease generated by a congestion of small ailments.

In addition to the ten, an eleventh commandment also is added, which, like all eleventh commandments is sufficiently obvious to be overlooked frequently. It is: Always adhere strictly to the maker's instructions which will apply to his type of cells.

You Can Afford the $2000 Mitchell

—Afford to **buy** it because it is moderate in price.

We know you can afford to **keep** it, because we have many letters from users of Mitchell, testifying from actual daily experience, that it is the most economical car to **operate.** Before **you** buy a car, send for these letters and try a Mitchell in a 50 or 100-mile road test.

In demonstration, you'll notice not only that its style, finish and construction is equal to that of the extravagantly high priced cars, but that its **performance is too.**

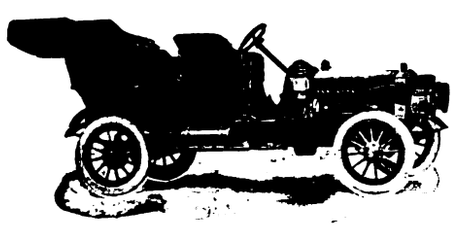
Proof is easy, Mr. Business Man.

The Mitchell Agent will be glad to take you out at any time you say. Just call him up—no obligation on your part.

Try the $2,000 Touring Car—the $2,800 Limousine—the $1,250 Roadster or the $1,000 Runabout.

Get demonstrations of high priced cars and compare the Mitchell with them.

Call up the Mitchell Agent to-day and just say



"Show Me."

The Mitchell Touring Car shown below is 35 H. P.—4-cylinder—speed, 50 miles—finish, Mitchell blue—price, $2,000.

Write for Catalogue No. 18, describing the other Mitchell models.

Mitchell Motor Car Co., 287 Mitchell street, Racine, Wis.

SIX-CYLINDER ENDORSEMENT

¶ At the present time (September, 1908) there are over 1,250 STEVENS-DURYEA Six-Cylinder Cars in use—from Portland, Maine, to Portland, Oregon—from Minneapolis, Minnesota, to Mexico City, Mexico.

Every Stevens-Duryea SIX is giving perfect satisfaction

¶ It is an acknowledged fact that any one who has ever driven a STEVENS-DURYEA **SIX** will never go back to a Four, excepting for a smaller car. This strongly shows the tendency of the future. Any one purchasing a Four-Cylinder Car of more than forty horsepower and paying over $2,750 should preferably secure a **SIX.**

The Week's Patents.

892,452. Spring Wheel for Motor Cars and Other Vehicles. Emilo Rodriguez, Chiswick, London, England. Filed July 23, 1907. Serial No. 385,130.

1. In combination, a felly having two springs of elliptical shape connected thereto by a bolt, the ends of the springs connected to cross bolts, a tread suspended upon the said springs by side pieces, a bolt carried by the said side pieces, carrying a roller, a flexible band of leather connected to the said cross bolts of the springs, the said roller resting in the leather band, to flexibly support the tread.

892,481. Glass Front for Automobiles. Julius Wieden, Los Angeles, Cal. Filed Oct. 2, 1907. Serial No. 395,631.

1. A glass front for automobiles comprising a frame, means for attaching the frame to an automobile, a series of transparent panels pivoted in the frame, an operating bar connected with all of the panels, a strap around the center of each panel, each strap having an ear, an operating bar connected to the ears, a hand lever pivoted on the frame, a link connecting the hand lever to the operating bar, a sector, and latch mechanism for latching the hand lever in position on the sector.

892,499. Carburetter. Ernest N. Broderick, Detroit, Mich. Filed May 22, 1907. Serial No. 375,030.

1. A carburetter comprising a float chamber, a vaporizing chamber over the float chamber, an atomizing valve discharging from the float chamber into the vaporizing chamber, opposite air inlet ports in the vaporizing chamber, a valve closure within the vaporizing chamber, adapted to close said ports either independently or simultaneously, deflecting means opposing the air ports, an outlet port in the vaporizing chamber, a closure for the port within the chamber, and a throttle lever controlling the atomizing valve and inlet and outlet closures.

892,539. Driving Mechanism. George W. Morris, Racine, Wis. Filed April 20, 1908. Serial No. 428,204.

1. In a device of the class described, the combination with a shaft and a wheel loosely mounted on said shaft and provided with an internal gear and a laterally-extending annular flange, of a second wheel loosely supported on said flange and also provided with an internal gear, and a clutch device secured to and slidingly mounted upon said shaft and adapted to be moved into engagement with either of said internal gears.

892,544. Engine Starter. George L. Odenbrett, Milwaukee, Wis. Filed Oct. 5, 1907. Serial No. 396,105.

1. A starter for multiple cylinder engines, comprising a selecting valve driven by the engine and adapted to establish communication with the respective cylinders of the engine when their pistons are in position to receive an explosion, a charging chamber communicating with the selecting valve, an air reservoir and a gas reservoir communicating with the charging chamber, and controlling valves in the connections between the charging chamber and the air reservoir and the gas reservoir and the selecting valve respectively.

892,569. Fuel Burning Apparatus for Motor Vehicles. George E. Whitney, Boston, Mass., assignor, by mesne assignments, to Stanley Motor Carriage Company, a Corporation of Massachusetts. Filed Feb. 18, 1901. Serial No. 47,723.

1. In an apparatus of the class described, one or more mixing chambers having curved side walls and top and bottom plates, air supply tubes leading through said chambers and plates, an inlet conduit for each mixing chamber entering the latter adjacent and approximately tangentially to the curved side wall thereof arranged to project its supply through the bottom plate and towards the top plate of its chamber.

892,609. Starting Device for Explosive Engines. Lawrence S. Nash, Detroit, Mich. Filed July 31, 1907. Serial No. 386,358.

1. Starting mechanism for a multi-cylinder engine, comprising a pair of valves each adapted to admit compressed air to the cylinder of the engine, a cam shaft driven by the engine cams movable on the said shaft, adapted to operate said valves, a slide rod journaled in the shaft, oblique slots formed in the shaft, studs extending through the slots, connecting the slide rod and cams, and a spring on the slide rod, normally holding said cams disengaged with the valves.

892,673. Wheel Tire. Andre Michelin, Paris, France. Filed No. 4, 1905. Serial No. 285,817.

In combination in a tire, a body, a tread attached thereto, a band of leather over said tread, rivets passing through said tread and band of leather, a layer of rubber uniting said band of leather to said tread, and a layer of rubber between said tread and the body, in the middle part of the tire, in which layer the washers of the rivets are embedded.

892,691. Roller Bearing. Eliel L. Sharpneck, Winthrop, Mass. Filed July 8, 1907. Serial No. 382,577.

1. A roller bearing comprising a cylindrical casing having an annular rib on its inner surface, a series of anti-friction rolls having annular channels, engaged with said rib, and annular grooves, a series of pairs of separator rolls, arranged between the anti-friction rolls, one of each pair of the separator rolls having annular ribs engaged in the annular grooves of the anti-friction rolls, and rotatable means engaged with each pair of separator rolls, as described.

892,744. Transmission Gear. Frederick E. Landberg, McCook, Neb. Filed Aug. 27, 1906. Serial No. 332,257.

1. The combination, with an intermediately pivoted transverse axle and wheels loosely mounted on the ends thereof, of gears rigidly secured to said wheels, a shaft mounted on said axle, gears carried by said shaft and adapted to mesh with the gears on said wheels, an auxiliary shaft on said axle, means to drive said auxiliary shaft including a sprocket mounted thereon and having universal movement with relation thereto, and means of connection between said main and auxiliary shafts.

892,761. Radiator. George W. Nutz, Chicago, Ill. Filed Sept. 16, 1907. Serial No. 392,973.

1. In a radiator of the type herein described, the combination of a casing comprising upper and lower horizontal members and vertical side members forming an open center, a series of radiator tubes arranged in said center and a series of secondary tubes arranged within the radiator tubes and open to the atmosphere at both ends, one of the casing members having a curved inlet throat formed by a flat plate to which the secondary tubes are attached at one end and a curved plate forming a deflector for directing the air into the secondary tubes, substantially as set forth.

892,763. Induction Coil Unit. Carl A.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets of the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

WE have market in southern California for high grade automobile specialties and supplies, which are not already represented in this territory; to act as manufacturers' agent on commission basis. Full particulars should be furnished. Address A. CO., care of Motor World, New York.

Hfanstiehl, Highland Park, Ill. Filed Nov. 11, 1907. Serial No. 401,640.

A coil section or unit, comprising a pair of outer spool heads formed with central orifices and anular necks, one of which necks fits over the other, an intermediate head formed with a corresponding orifice and with a small passage adjacent to said orifice, said intermediate head being arranged intermediate of the outer spool heads, and reversed coil windings in the annular cavities between the heads aforesaid and connected together by a wire extension passing through the small passage aforesaid, substantially as set forth.

892,790. Compound Explosive Engine. Joseph A. Williams, Cleveland, O. Filed June 7, 1905. Serial No. 264,088.

1. In a compound explosive engine, a high-pressure cylinder, a valve connected with said high-pressure cylinder through which air may be admitted thereto during the exhaust from the said cylinder, means for preventing said valve from opening except during the exhaust from the high-pressure cylinder, and a second valve through which the air is drawn from the cylinder, said air scavenging and cooling the cylinder.

892,832. Radiator for Automobiles. August L. F. Holzerland, Buffalo, N. Y. Filed Sept. 10, 1906. Serial No. 333,978.

1. In a radiator for automobiles and the like, the combination with the inlet-chamber having an inlet-pipe, an outlet chamber having an outlet pipe, and the fluid passages connecting said chambers, of a fluid receiver within the inlet chamber and inclined in opposite directions from said inlet pipe.

892,853. Pneumatic Tire for Vehicle Wheels. John R. Kline, Los Angeles, Cal. Filed Feb. 20, 1907. Serial No. 358,518.

1. A pneumatic tire comprising an outer tube and inner tubular means having a plurality of sections formed as elastic cells placed end to end, each forming a pneumatic chamber, and means for inflating all of said cells simultaneously comprising a distributing tube having an inwardly opening check valve, a check valve opening inwardly in each cell from without the distributor tube and accessible from without the distributor tube to permit forcible opening thereof.

892,859. Speed Changing Gear. Charles H. Lee, New York, N. Y. Filed June 21, 1907. Serial No. 380,044.

1. A speed changing gear, comprising a drive shaft, a driven shaft, a plurality of gears adapted to be locked to one of said shafts, a plurality of gears mounted on the other of said shafts and intermeshing with the corresponding first mentioned gears, the gears on one of said shafts varying in size, whereby dicerent relative rates o frotation of the shafts may be secured, selective means for locking any one of the other set of gears to its shaft, and means for unlocking all of the dicerent sized set of gears from their shaft, save the high speed gear when the high speed gear of the other set of gears is locked to its shaft by the operation of said lelective means.

892,864. Cooler for Automobiles and the Like. Jonathan D. Maxwell, Tarrytown, N. Y., assignor to Maxwell Briscoe Motor Company, North Tarrytown, N. Y. Original application led Dec. 31, 1904, Serial No. 239,160. Divided and this application filed Sept. 28, 1905. Serial No. 280,451.

1. In an automobile, the combination with an engine having a cylinder with a jacket for cooling medium, of a radiator having unright channels forming a primary field and a secondary field for passage of the cooling medium, and a central chamber in communication with said channels and arranged substantially horizontally and medially across said radiator, to receive the heated fluid from said jacket, said fluid passing from said central chamber to said primary cooling field, whence it returns into said central chamber, and thence passes to said secondary cooling field, substantially as described.

892,866. Roller Bearing. Eimle Moonen, Paris, France. Filed May 8, 1907. Serial No. 372,603.

1. In a roller bearing, the combination of two bearing rings, each in one piece, one of which is provided with a circular rib and the other with a circular channel, an extensible segment lodged in said channel forming a rib on the ring, rollers having grooves engaging with the circular rib and with the segment, the channel ring being provided with holes for permitting access to the segment to compress the same, whereby the bearing can be assembled and dismounted by sliding one bearing ring along the rollers carried by the other bearing ring.

Warner Auto-Meter

GUARANTEED FOR ONE YEAR.

"Thirty Days' Free Trial"

When a manufacturer is willing to send his product to anyone, anywhere, for 30 days—with no deposit, no agreement to buy, no promise to do anything except give that product a fair trial—he must have more than ordinary confidence in his article. In order for him to have that confidence he must have a most extraordinary product.

That's what we do. We'll send an Auto-Meter to any automobile owner in the country—with no deposit, no agreement, no promise to do anything but put it on his car and give it a fair trial. It doesn't matter whether he has another make of speed indicator already on the car or not. Indeed, for the sake of comparison, we hope he has. We will abide by the decision—for he will always keep the indicator that tells the truth. We claim for the Auto-Meter that it is the only one of which "the dial never lies." We believe that the instrument itself is the most eloquent salesman we have—we're willing to let it do our talking. Send to-day—just tell us what make and model of car you have—size of tires, etc.,—and we will send you an Auto-Meter.

"The Name Prevents the Slip"

"Firestone"

Non-Skid Tire

The newest and most practical non-skid tire. It meets the necessary requirements better than any other on the market.

The non-skid tread is formed by the raised letters of the words "FIRESTONE NON-SKID" arranged obliquely across the body or tread surface of the tire

The letters of the words form more angles and points of contact than any other non-skid tread. The spaces in and between the letters cause just the right amount of suction to grip the slippery road and prevent side slipping. Thus the name prevents the slip.

Don't fail to see this remarkable tire at any of our Branches.

Announcement 1909

THE MARMON CAR

The Easiest Riding Car In The World

Marmon "Thirty-two"

Touring Car or Roadster

$2400

Not An Automobile On Paper But A High-Grade Marmon, Carefully Built and Completely Equipped, At A Very Attractive Price.

In meeting the demand for a lighter car at a price within easy reach of a larger circle of buyers, this Company has not felt called upon to slight its design, cheapen its material nor permit any variation from the superb workmanship that has characterized the Marmon from the beginning.

An institution known for more than fifty years as a builder of machinery of the highest grade cannot afford to attach its name and guaranty to an automobile that will not measure up with the best at home or abroad.

Understand, therefore, that the 32 H. P. Marmon, selling at $2,400, is a high-grade car in every sense of the word.

The design is not merely one that looks good on paper, but it is a reality—practical, proven.

In careful workmanship, in choice of materials, in patient building, in all that goes to make a really excellent, dependable automobile, this $2,400 car will maintain the Marmon reputation.

Another thing—these cars are being built.

We are not merely collecting orders on hopes.

The cars are being built—built by us and built to endure under hard service.

And you may be sure that the makers of the Marmon are going to be in business and will be responsible to their customers, just as they have been for over fifty years.

We are certain from past successful experience that there is an ample market among thoughtful buyers for automobiles possessing the Marmon character, and backed by a reasonable firm.

And to that class of buyers, a Marmon at $2,400 is a bargain that speaks for itself.

Weighing not to exceed 2,000 lbs., fully equipped, and having 32 to 40 H. P., this car has a world of power and speed.

Light, graceful, unusually quiet and comfortable, this car presents a known value which invites the closest mechanical inspection.

Furnished with either five-passenger, four-passenger or roadster body. The rear seat of the four-passenger body can be removed leaving a platform for trunks and luggage, making it an ideal suburban car.

Specifications

Frame—Pressed steel.
Motor—Four cylinders, four cycle, water cooled. Bore 4½ inches; stroke 4¼ inches. Cylinders cast in pairs and set vertical.
Horsepower—Thirty-two to Forty.
Transmission—Selective type sliding gear arranged very compactly in case adjoining differential housing on rear axle—three speeds and reverse. Mounted in large H-B ball bearings.
Clutch—Expanding ring.
Drive—Bevel gear, shaft drive.
Rear Axle—Floating type. Bevel gear differential removable through axle housing directly to the rear. Large H.B ball bearings throughout.
Front Axle—Forged steel I section.
Brakes—Two brake shoes 14 inches diameter by two inches face in each rear wheel. Both internal expanding placed side by side, both faced with fabric. Operated by equalizers. Improved screw and segment adjustment conveniently placed.
Clearance—Ten inches.
Wheelbase—112 inches. Tread 56½ inches.
Wheels—34x3½ inches quick detachable tires.
Steering Gear—Irreversible, screw and nut. One adjusting nut. Eighteen inch steering wheel.
Control—Spark and throttle levers on steering wheel. Foot accelerator.
Oiling—Patented automatic force feed in motor, delivering oil through the hollow crank shaft directly into the main bearings, connecting rod bearings, and piston pin bearings. Oil thrown off by movement of crank lubricates the walls of the cylinders and other bearings. Oil pressure is regulated with an adjustable relief valve placed conveniently outside the crank case. Oil returns to reservoir below the sweep of the cranks and is used over and over. Oil consumption and wear reduced to the minimum.
Ignition—Bosch high tension magneto and battery, dual system, one set of plugs over intake valves.
Carburetor—Automatic, float feed.
Gasoline Tank—Capacity seventeen gallons; tank under front seat, gravity feed.
Springs—Rear, full elliptic 40x2; front, semi-elliptic 35x2.
Body—Sheet metal.
Finish—Black or maroon with running gear in same.
Tools—Very complete assortment of tools neatly arranged.
Weight—2,000 pounds.
Equipment—Two large gas lamps, gas generator or Prest-O-Lite tank; two dash and one oil tail light; horn with flexible tube and bulb; complete assortment of tools, two oilers, jack, tire repair kit and pump. Price $2,400 f. o. b. Indianapolis, Indiana.

Announcement 1909

THE MARMON CAR

The Easiest Riding Car In The World

Marmon "Fifty"

With Seven-Passenger or Four-Passenger Body

$3750

A Car of Known Value, Acknowledging No Superior At Home or Abroad.

The Marmon Car has for many years been known to the well informed as one of the three or four really high-grade cars produced in America.

The Marmon "Fifty" represents the last word in automobile design and construction to date. Luxury in the extreme marks its easy riding qualities, luxury marks its appearance; and, above all, luxury lies in the knowledge that it will do its work steadily from the beginning to the end of the journey. Faster than you care to go, with ample reserve power for the steepest grades or the heaviest roads, it carries seven passengers in ease and comfort.

A reading of the specifications will at once inform the experienced motorist that he gets in this model all—and more—that he obtains in the most famous foreign cars sold at two or three times the price, and more than he gets in any other American car at any price.

And it is worth remembering that these cars are designed and built entirely by us in the Marmon way—marked by the best engineering skill and the most conscientious workmanship.

The Marmon "Fifty" may be had with either Seven Passenger Touring Car or Close-coupled Four passenger body.

The Marmon Forty-five Roadster

This roadster possesses all the high character of The Marmon "Fifty," with a little shorter wheel base, a slightly smaller engine, and a few other details necessary to make the roadster a distinctive type. It offers a combination of high speed with unusually easy riding qualities.

Price, fully equipped, $3500

Specifications

Frames—Pressed channel steel. One frame carries the body and a sub-frame carries the power plant.
Motor—Water cooled, four cylinders, vertical, four cycle, bore five and three-eighths inches, stroke five inches. Cylinders cast in pairs, intake valves on one side, exhaust valves on the other side.
Horsepower—Fifty-Sixty.
Transmission—Selective, three speeds and reverse. Mounted in large H-B ball bearings. No gears in action on direct drive. Automatic brake slows down clutch and gears.
Drive—Bevel gear, shaft drive.
Rear Axle—Floating type. Bevel gear differential removable directly through rear of axle housing. Large H-B ball bearings throughout.
Front Axle—Steel I section.
Brakes—Two, 17 inches diameter by 2-inch face in each rear wheel side by side. Internal expanding faced with fabric, simple, convenient adjustment. Operated by equalizers.
Clearance—10 inches.
Wheel Base—118 inches. Tread 56½ inches.
Wheels—36x4 inches; 36x5; quick detachable tires.
Steering Gear—Screw and nut. Irreversible. Mounted in conical roller bearings, enclosed in dust proof, oil-tight case.
Control—Spark and throttle levers on the steering wheel. Foot accelerator.
Oiling—Patented automatic force feed in motor, delivering oil through the hollow crank shaft directly into the main bearings, connecting-rod bearings and piston-pin bearings. Oil thrown off by movement of cranks lubricates the walls of the cylinders and other bearings. Oil pressure is regulated with an adjustable relief valve placed conveniently outside of the crank case. Oil returns to reservoir below sweep of cranks and is used over and over.
Ignition—Jump spark. Bosch high tension magneto and Battery. Two independent systems.
Carburetor—Automatic float feed.
Gasoline Tank—Capacity 20 gallons. Carries reserve supply with separate outlet for same. Pressure feed by mechanically operated air pump.
Springs—Full elliptic front and rear.
Body—Cast aluminum entirely.
Finish—Black or maroon with running gear the same.
Equipment—Two large gas lamps; gas generator or Prest-O-Lite tank; two dash and one oil tail light; horn with flexible tube and bulb; complete assortment of tools, two oilers, jack, tire repair kit and pump; two extra folding seats in tonneau. Price $3,750.00 f. o. b. Indianapolis, Indiana.

Stewart Speedometer

For 1909 we announce the most complete and beautiful line of SPEEDOMETERS ever shown—values not possible for any other speed indicator to even equal.

They combine features of workmanship, materials, construction, equipment and performance that have never been equaled by any speed indicator at any price.

Model 5, 90 mile, $50.
Model 4, 60 mile, $40.

Model 4. The same beautifully designed instrument as of last season, to which we have added an improved trip register of three dials, recording miles and tenths, which can be reset to a zero automatically. This instrument will also be equipped with a maximum speed hand. The construction of the mechanism for operating the trip and maximum hands is different to any heretofore used, and enables us to eliminate springs and other devices liable to derangement. Price, ... **$40.00**

Model 5. A duplicate of Model 4 in every feature, but made to indicate speed of 90 miles. Price last season $75, but owing to the enormous quantities being sold we will this season list the same at **$50.00**

Model 9. Comprises the No. 4 Speedometer and a 4-inch 8-day Chelsea Clock, the best automobile clock on the market; both mounted on a handsome brass base, and equipped with electric light **The most attractive combination possible.** Price, ... **$75.00**

Model 11. Something entirely new in speedometer construction. A 4-inch instrument similar in design to the Model 4, but will indicate speed from zero to 60 miles; is equipped with both season and trip register and automatic resetting device. The scale is three times the length of that used on any other speedometer, and which makes it the most easily read indicator on the market. The construction is of the costliest kind, every part is of the same high standard used in all our instruments and includes jewel bearings. **This instrument is destined to be the quickest selling, most attractive, most satisfying of all instruments, regardless of price.** Price, . . **$25.00**

Model 11, $25.

Model 12, $15.

Model 10. A combination of the above described Model 11 speedometer and 8-day Chelsea Clock, mounted on a brass base, equipped with electric light. Price, . . **$60.00**

Model 12. The handsomest little instrument ever produced; will indicate speed of 50 miles; has enclosed season odometer with capacity of 10,000 miles. Is in every feature the same as our $25 instrument of last season, with the exception that it is made with a 3-inch dial. **It is a thoroughly high grade instrument, better than any other speedometer, as a trial alongside any other make will prove.**

All Models to be equipped with the famous Stewart Flexible Shaft and Swivel Joint, and all are **covered by an ironclad 5-year guarantee.** Send for our 1909 catalog.

FORD FOUR-CYLINDER TOURING CAR

$850.00

When you can couple the Ford guarantee—the guarantee of the best known automobile manufacturer in the world, whose imprint is already on more good cars than any other concern has made or promised—with the lowest price ever announced for a Touring Car, it's a mighty safe buy.

MODEL T TOURING CAR, $850.00
High Priced Quality in a Low Priced Car.

Here is the first and only chance ever offered to secure a touring car at a reasonable price, a price any man can afford to pay. It is a big, roomy, powerful car, of handsome appearance and finish, at a price lower than you are asked to pay for any four cylinder runabout, excepting the "FAMOUS FORD." This car sounds the death knell of high prices and big profits.

When this now famous FORD runabout was announced other manufacturers, despairing of being able to compete, knocked—"A good car could not be built at the price, much less sold." Every knock was a boost. With 20,000 cars Ford proved the car was right. Ford's financial standing to-day proves the price was right. And the knocking that will be done on this new car will be silenced in the same fashion.

Henry Ford promised three years ago to build a high grade touring car, and sell it at a heretofore unheard of price, and now just as surely as every claim made for the small car was made good, just so surely has Ford made good this promise.

The Model T is that car, the car that was promised, a four cylinder, 20 horse power touring car—a roomy, commodious, comfortable family car, that looks good, and is as good as it looks.

This is no imitation car. Henry Ford has never found the need to copy, and the fact that he has never designed a failure is your security that in the Model T touring car Ford continues to be two years ahead of any car manufactured to-day.

We have no high sounding name with which to charm sales. It's the same old name, "plain as any name could be"; it's just "FORD," but it has the advantage of being already on 20,000 cars (real automobiles) that have "delivered the goods."

You know that Henry Ford can build a better car for less money than any other manufacturer on the face of the earth. You know it because he has always done it, and that is your guarantee of his ability, and your security in dealing with him.

Our organization is made up of that same force of men that you have learned to know as being connected with the manufacture and sale of an honest product. It's the same old Company that has been doing business right along; the same old successful organization and plant.

Not having anything new but the car, and because it is unnecessary for us to spend money to solicit confidence in our company (that being already secured by past performances) we can devote all our time and money to taking care of the orders for the car that people have actually been waiting for—a family car at an honest price.

The Model T is a four cylinder, 20 horsepower car of graceful design, powerful in appearance and reality, and of sturdy construction. It is not a new car in the sense that it has been conceived, designed and built all in a few weeks. Mr. Ford started on the car three years ago. Two years were spent in designing, experimenting and research. A year ago the first cars were shown, and for twelve months have been in constant service.

These experimental cars have been run under every conceivable condition. All last winter they were tried on the snow and slush covered country roads—all summer they have worked on the hills, on the sand and mud roads in good and bad weather.

It is a new car, however, in the sense that it is not an old chassis with a new body or an old engine in a new chassis, but it is a new car built throughout to meet the requirements of a family car. The engine is new (20 horsepower), cylinders cast in one block with top removable so that the cylinders, pistons, valves, etc., are get-at-able. The chassis is new, a hundred inch wheel base and 30 inch wheels. The transmission is of new de-

20 HORSEPOWER FIVE PASSENGER FORD

f. o. b. Detroit

MODEL T TOWN CAR, $1,000.00
High Priced Quality in a Low Priced Car.

Any car now selling up to several hundred dollars more could, if built in the Ford factory from Ford designs, by Ford methods and in Ford quantities, be sold at the Ford price if the makers would be satisfied with the Ford profit per car.

sign (planetary, of course), and altogether silent; $150,000 worth of new machinery and tools were added before we could start to build.

Vanadium steel, the strongest, toughest and most endurable steel ever manufactured, is used throughout the entire car. The only reason every automobile manufacturer is not using Vanadium steel is either that they cannot afford to or do not know how. To use it in Fords required two years of experimenting, and an expenditure of $200,000, plus the increased price of steel.

We could have announced the car last year; we wanted to prove it in actual service; held it a year when we knew people were anxious to buy. Now we know the car is right. It's built for the sort of use the average buyer gives a car, and no car made, no matter what the price, can excel this Model T in practicability and service.

Announcing this car at this time we are not taking time by the forelock—we are not announcing with the intention of waiting for orders before commencing to build. October 1 will find us delivering cars, not promises. Not a line of advertising appeared, not an order accepted until we had the completed car and knew exactly when we could start to fill orders. Our dealers have guaranteed us an enormous demand, however, so that an immediate order is advisable. While we do not know how many of these cars we will build in the next twelve months, the price per car is based on building 25,000 cars. We will not build any less—we may build more. We have manufacturing facilities for 100 complete cars per day. A careful study of conditions and of reports from our selling force indicates that even this large capacity will be insufficient. So wire your order—now is the proper time to buy.

SPECIFICATIONS.

MOTOR—Four cylinder, four cycle, vertical, 20 horsepower; cylinders cast in single block, with water jackets and upper half of crank case integral. Water jacketed cylinder head removable, offering easy access to all interior parts of engine. Pressed steel lower half of crank case extends to form lower oil tight housing for flywheel, transmission, magneto and universal joint.
TRANSMISSION—New design Ford spur planetary; no internal gears. Silent at all speeds. The quietest, easiest transmission ever manufactured.
IGNITION—By Ford low tension magneto generator, an integral part of the engine direct driven by engine shaft; no gears, belts, brushes or contact points. Simplest and most positive system of ignition.
CONTROL AND DRIVE—All forward speeds by foot lever, reverse by hand lever, transmission brake by second pedal, emergency brake on rear hubs by second hand lever. Drive on left side, throttle and spark control under steering wheel.
WHEELS—Thirty inch artillery wood type, pneumatic tires, 3 inch front, 3½ inch rear; tread, 56 inches; wheel base, 100 inches; weight, 1,200 pounds.
GASOLINE CAPACITY—Ten gallons, enough for 225 miles.
EQUIPMENT—Three oil lamps and tube horn. With body ironed for top.
BODIES—Touring car as shown and now ready for delivery; also supplied in landaulet, taximeter cab, coupe and town car style. Runabout and roadster.
PRICE—On touring car, $850.00; landaulet or taximeter, $950.00; coupe, $950.00; town car, $1.000.00 F. O. B. Detroit.
DELIVERY—Beginning October 1 on touring cars; November 1 on other styles; runabout and roadster for spring delivery.

We want some more dealers—live, wide-awake hustlers. If you are that kind of a man, even tho not now a dealer in automobiles, there's a chance to make money with the Ford line right in your own home town. Write to-day for full particulars, for we are ready to make contracts for 1909.

AND COSTS LEAST WHILE IT LASTS

WINS The 24-Hour Race at Brighton Beach

Setting 16 New World's Records

Beating the previous world's records 23 hours in the 24 and beating by the tremendous margin of 70 miles, the previous best 24 hour performance of any car in the world.

One and one-half hours before the end of the 24 hours, the Simplex, driven by Lescault and Robertson, had passed all previous records for the 24 hours. At the conclusion of the race, the winning Simplex was in perfect condition, not a bolt, nut or screw being out of place. The car was capable of immediately repeating its performance, and if pushed, in considerably faster time. Driven by Lescault, the Simplex made in the 5th hour the record run of 57 miles, beating its own previous world's record of 56 miles in one hour, made during the last 24 hour race.

Hour.		Previous Record.

ANSWERED

Gentlemen:

After a thorough test on the road of the Peugeot chains which you sent to me to use in the Twenty-four Hour Race, I take pleasure in informing you that these chains went through the race without adjustment and without attention of any sort. They were in every way perfectly satisfactory, and I highly recommend them to anyone wishing to procure a satisfactory chain.

Thanking you for your kindness in affording us an opportunity to use them, beg to remain

Yours very truly,

ANOTHER RAMBLER RECORD

One Thousand Miles in Eight Days and Every Vital Part Perfect

RAMBLER ROADSTER AT CONCLUSION OF EIGHT DAY RUN.

EVERY vital part of the Rambler 1908 Roadster Model 34-A was in perfect condition at the finish of the great 1,000 mile, eight day reliability contest of the Kansas City Automobile Club. Second place was awarded to the Rambler—because of a six points penalty.

Only six points penalty—a remarkable record.

Seven days run of the eight showed a perfect score.

A hub cap was torn off when the roadster took the ditch in an exciting dash through a mire, filled with rocks, mud and disabled automobiles. That cost us three points, but the Rambler got through.

Then a spring shackle turned when the car took the ditch to pass another disabled car. That cost us three points more.

Forty-one cars were entered. Only twenty finished. Not one, selling within $700 of the cost of the Rambler, finished without a breakdown and all the high priced cars, driven by expert drivers, were there. The Rambler engine was running better at the finish than at the start.

There are certain mechanical features of the Rambler which made this great performance possible. If you care to know what these are, drop us a postal and we will be glad to send full details at once.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, October 8, 1908. No. 2

ROYAL HAS A REORGANIZATION

Creditors' Committee Assists Company to Start Again with Ample Capital—Producing New Models.

Endeavors to save the Royal Motor Car Co., of Cleveland, O., from dissolution, following the company's going into the hands of a receiver last fall, have been successful to the extent that a complete reorganization is announced as being effected. F. A. Scott, acting for the Superior Savings & Trust Co., of Cleveland, the corporation appointed as receiver, has obtained from the creditors' committee an arrangement whereby the reorganized company will resume activity with ample and unencumbered resources and plenty of working capital.

By considerable effort the assets of the company have been preserved with comparatively little loss, and at the same time the agency organization and good will have been carefully held together. Business can thus be resumed under the advantages of the company's old footing in the industry.

Under a permission order from Judge Taylor, of the United States court, the receiver has been able to go ahead and produce sample cars of the model it is proposed to offer for 1909. The agents throughout the country who have been handling the Royal car, have been advised of the success of the reorganization and that demonstrating cars will soon be shipped.

Seeks to Sell Logan Property.

A petition for authority to sell the property of the bankrupt Logan Construction Co., of Chillicothe, O., has been filed by the trustee of the estate with Elijah Cutright, Jr., the referee in bankruptcy. The hearing on the petition takes place October 10 at the referee's office in the Ross County Bank building, at Chillicothe. An appraisal of all the property except the book accounts shows machinery, $3,186.00; office fixtures, $416.25; stock, $15,895.55, and real estate, $18,736.00, making a total of $38,-233.80, with judgment liens on the real estate amounting to $760.00.

Haas to Develop Standard's Truck.

Although it has not been generally known in the trade, the Standard Roller Bearing Co., Philadelphia, Pa., for some time has been experimenting with a combination gasolene-electric truck. The services of H. J. Haas, formerly superintendent of the E. R. Thomas Motor Co., of Buffalo, N. Y., have now been secured to carry out its development. The design is based on a system, the basic patents for which are owned by the Standard company, and the formation of an independent company, to be known as the Standard Gasolene and Electric Truck Co., to handle this branch of the business, is contemplated.

Friswell Made Factory Manager.

Arthur E. Friswell has been made factory manager of the Hartford Rubber Works Co., at Hartford, Conn., to fill the vacancy caused by the death on September 22, of Valentine B. Lang, who in addition to his duties as vice-president of the company, had charge of the factory. Past experience in a similar capacity with the Mechanical Fabric Co., of Providence, R. I., before going to Hartford, well qualifies Friswell for his new duties.

Mooers with Cleveland Auto-Cab.

Louis P. Mooers, engineer and designer, instead of joining the staff of the Aerocar Motor Co., of Detroit, Mich., as reported recently, has gone with the Cleveland Auto-Cab Co., which has its offices in Cleveland and its plant in Geneva, Ohio. Mooers will be in charge of a large part of the work at the latter place.

Bailey Resigns from St. Louis Car.

Theodore P. Bailey has resigned as general manager of the automobile department of the St. Louis Car Co., of St. Louis, Mo., makers of the American Mors. His successor to the place has not as yet been appointed.

SHOW SPACE IN HEAVY DEMAND

Allotments for Forthcoming Exhibitions are Being Made—Car Makers Crowd Chicago's Facilities.

Show matters brought many prominent tradesmen to New York City this week, to attend the sessions of the National Association of Automobile Manufacturers, the American Motor Car Manufacturers Association, or the Association of Licensed Automobile Manufacturers, all of which have show and business meetings scheduled. A general meeting of the N. A. A. M. was held on Wednesday morning at which all of the directors were present. This was followed by a meeting of the show committee in the afternoon, at which allotments of Chicago show space to the automobile manufacturers were made.

For the Chicago show there were 95 manufacturers of cars who desired exhibition space, and of these, 84 were given an allotment, the other 11 having been late in making application. The latter will be taken care of in the Coliseum basement, however. The space alloted takes in the main floors of the Coliseum, the Annex, and the Armory, as well as a large part of the Coliseum basement. The Motor and Accessory Manufacturers, Inc., undertakes the allotment of the gallery space to its members.

Mora Heads a New Company.

Real automobiles, with gasolene motor and all the mechanism, but made in juvenile sizes at a low price, will constitute the product of a newly organized concern of which S. H. Mora, of the Mora Motor Car Co., is president. The Child's Automobile Co. is the name adopted, and the company will use the factory building on Siegrist street, Newark, N. Y., formerly occupied by the Mora factory. The cars will be small, single cylinder affairs of a so-called "pony" type, to sell for from $150 to $250, and are intended for children.

Digitized by Google

In the Retail World.

C. M. Atherton has opened an automobile establishment in Sheldon, Ia. Garaging and repair facilities are a feature.

Peter Wood has opened a garage at 23 Eighth avenue, Newark, N. J. He will conduct a general storage and renting business.

Yount & Blincoe, of Sedalia, Mo., have closed their automobile garage. The business affairs of the concern are being wound up.

The Packard Motor Car Co. has opened a branch office at 14 Branford place, Newark, N. J. Gilbert V. Burdett is the local manager.

William Stout & Co. is the style of a new firm which has "opened up" at Irvington, N. J. The firm will engage in a garage and repair business.

To handle the Ford in Utica, N. Y., a new concern, called the Ford Sales Co., has been formed. Frank E. Henabray and A. P. Howarth are the owners.

The Independent Automobile Co. has been formed in Indianapolis, Ind., to handle the Oakland car. The company's salesroom will be located at 216 East Vermont street.

The Moon Motor Sales Co., of which C. A. Duerr is the head, has leased new quarters at 1781 Broadway, New York City. The concern will handle the Moon car, made in St. Louis, Mo.

"Distress warrants" have been issued against the Augusta Motor Co., of Augusta, Ga., by R. E. Heath, who claims that the concern is back in its rent. Seven automobiles were attached.

The Penn Motor Car Co., of Philadelphia, Pa., expects to move into a large three-story brick building at the northwest corner of Broad and Cherry streets early in October. The rear part of the building will be used for garage and repair purposes, while the front will be fitted as show rooms, business offices and reception rooms, with special rooms for the ladies.

Duerr in Receiver's Hands.

Bankruptcy proceedings against Chas. A. Duerr & Co., 2182 Broadway, New York City, have been instituted by Julius O. Foote, attorney for three of the creditors. The petition alleges that the corporation is insolvent, and that preferential payments have been made. Judge Holt appointed Lindsay Russell as receiver. The nominal assets have been given as $60,000, though their actual value has been estimated at $40,000, while the liabilities, according to Foote, are about $100,000. The concern is indebted to two of the petitioning creditors, the Firestone Tire & Rubber Co., and the Hartford Rubber Works Co., to the amount of $401 and $251, respectively.

Duerr is a pioneer New York agent and has the distinction of being one of the earliest defendants named in the prosecution of the Selden patent, incidental to his handling the Ford at that time. Latterly he has had the Royal agency. The corporation was organized in May, 1903, with a capital stock of $5,000, which was increased to $30,000 in December, 1906. Last January the company acquired the lease and assets of the Metropolitan Auto Co., and has since made garaging and storage a large feature of the business. About 100 cars are using the garage, under contracts of from three months to three years, each paying $30 per month, making a monthly income of about $3,000. It is thought that the receiver will endeavor to continue the company's garage service in order to save many of the dependent assets.

Bendix Seeks Loan in Logansport.

In its efforts to get started in Logansport, Ind., the Bendix Automobile Co. has asked for a loan of $75,000 cash, tendering as security a large block of preferred stock. Members of the Land & Improvement Co., a newly organized Logansport association which is seeking to encourage manufacturing concerns to locate in the city, have pledged $20,000 of the amount and hope to arouse enough "public spirit" to get the rest.

To Make Electric Vehicles in Toledo.

Basing expectations of success on the merits of a new storage battery invented by A. F. Clark, a new concern, to be known as the Toledo Electric Vehicle Co., has been started in Toledo, O. It has been incorporated at $50,000, with Willard E. Allen, A. F. Clark, Frederick B. Willard, E. J. Hall and J. W. Schaufelberger as the incorporators. A factory building for electric runabouts has been secured at Collingwood and Delaware avenues.

Kissel Kar Agency for New York.

New York City representation for the Kissel Kar has been arranged, the Apthorp Motor Car Co., 214 West Eighteenth street, having closed a contract with the Kissel Motor Car Co., of Hartford, Wis., to handle the latter company's three models in the metropolis and its vicinity. F. S. Dickinson is president of the Apthorp company, which was but recently organized.

Strawbridge Succeeds Woods.

James B. Strawbridge has been elected general manager and treasurer of the Cleveland Motor Car Co., of New York City. He succeeds Walter A. Woods, who resigned last July to organize an independent enterprise.

Paying the Third Pope Dividend.

Checks for the payment of the third dividend of 25 per cent. to the creditors of the Pope Mfg. Co. have been sent out. It is planned to pay the creditors in full and have the reorganization in effect before November 15.

The Week's Incorporations.

Lansing, Mich.—Auto Body Co., The increases its capital from $25,000 to $150,000.

Clute Brothers' automobile business in Cohoes, N. Y., has been sold to the Campbell & Clute Machine Co., It will continue without material change of policy.

Cincinnati, O.—Eagle Automobile Co., The, under Ohio laws, with $10,000 capital. Corporators—F. L. Rhau, Henry Kressell, John Murphy, Fred L. Hoffman and C. O'Hern.

Branford, Conn.—Shore Line Garage Co., The, under Connecticut laws, with $10,000 capital. Corporators—John T. Manson, Minotte S. Chatfield and Winthrop G. Bushnell, all of New Haven, Conn.

Chicago, Ill.—Multi-Unit Gas Engine Co., under Illinois laws, with $25,000 capital; to manufacture and deal in motors and motor vehicles. Corporators—James J. Maloney, A. C. Garey, William L. Simonton.

Oklahoma to Rebuild Old Cars.

Even if Oklahoma City, Okla., cannot have a full fledged automobile manufacturing plant, it will have the next best thing, in an establishment which will devote itself to buying old cars and rebuilding them for the market. The Auto Sales Co. is arranging for large purchases of decrepit machines, which after being rebuilt, refurbished and decked in dashing colors, will be sent forth to compete with newer but no more sprightly models.

Roberts to Move to Sandusky.

Removal from Clyde to Sandusky, O., has been decided upon by the board of directors of the Roberts Motor Co., which at present has its plant at the former place. A large number of the employes, with their families, will follow the factory to its new location.

Lillibridge Files Bankruptcy Proceedings.

Ray D. Lillibridge, formerly president of the Rees Company, of New York City, an automobile storage concern, has filed a petition in bankruptcy, with liabilities of $12,431. The petitioner has been identified with the trade in agency and advertising relations for some time.

Spiers Resigns from the Standard.

John C. Spiers, factory manager of the Standard Roller Bearing Co., of Philadelphia, Pa., has resigned. E. M. Eveland has temporarily assumed the management of the factory, in addition to his other duties.

Morrison Seeks Relief in Bankruptcy.

Albert E. Morrison, of Boston, Mass., at one time with the Morrison Automobile Co. and at present manager of a Boston taximeter cab company, has filed a voluntary petition in bankruptcy. He has liabilities of $3,070, and no assets.

EXPORTS GAIN IN FEW MARKETS

August Shows Increases in Only Four Divisions—Record for the Eight Months Given in Detail.

Comparison of the export figures for the month of August, while showing a considerable gain over the corresponding month last year in the markets of Germany, British North America, Other Asia and Oceania, and Other Countries, nevertheless indicates a general falling off in the other outlets. The total for the month is $390,870 as against $506,522, while the number of machines exported was 156, against 256 for August of last year. The traffic in parts also had a reduction, from $69,054 to $44,074. Next to British North America, the biggest purchaser for the month was the United Kingdom, with $125,904, somewhat less, however, than the $129,300 of the previous August. France bought $15,565, as compared with $45,385; Mexico, $15,740, as against $34,488, and West Indies and Bermuda $6,055, as against $56,372. The gain in British North America was from $135,905 to $173,768; in Germany from $8,093 to $14,508; in Other Asia and Oceania from $3,656 to $10,459, and in Other Countries from $1,950 to $2,736.

For the eight months concluding with August, the United Kingdom is the leading customer, with a total of $1,491,465 as against $1,464,470 for the same period last year. Gains are also shown in Other Asia and Oceania, and in Other Countries, the former having a total of $98,732 as against $49,484 last year, and the latter $24,327 as against $14,981. The total for the period, however, manifests a decline, the combined purchases amounting to $4,004,811 as against $4,752,012 for the eight months of 1907. The August increase in sales to British North America was not sufficient to offset the declines in the previous months, so that the total for the period was $866,604 as against $1,036,291 last year.

The summary in detail is as follows:

	August		Eight Months Ending August		
	1907	1908	1906	1907	1908
Automobiles, and parts of	.....	.....	*$2,356,110	.....	.....
Automobiles	$437,468	$346,796	‡$906,892	$4,263,437	$3,569,962
Parts of	69,054	44,074	‡73,418	488,575	434,849
Exported to—					
United Kingdom	129,300	125,904	952,543	1,464,470	1,491,465
France	45,385	15,565	271,286	528,253	526,323
Germany	8,093	14,508	107,675	152,936	138,039
Italy	436	93	234,997	241,536	219,229
Other Europe	18,011	4,796	171,255	251,245	169,350
British North America	135,905	173,768	656,343	1,036,291	866,604
Mexico	34,488	15,740	484,865	487,099	202,774
West Indies and Bermuda	56,372	6,055	201,441	209,722	111,578
South America	25,050	6,329	84,409	153,540	86,179

Other Asia and Oceania	3,656	10,459	44,535	49,484	98,732
Other Countries	1,950	2,736	15,569	14,981	24,327
Total	$506,522	$390,870	$3,336,420	$4,752,012	$4,004,811

* Figures are for six months, January to June, 1906. † Number not started prior to July 1, 1906. ‡ Figures are for July and August, 1906.

Northern Merger is Completed.

Absorption of the Northern Motor Co., including the factories at Detroit and Port Huron, Mich., by the Everitt-Metzger-Flanders Co., of Detroit, has finally been accomplished, the capital stock of the latter concern having been raised from its temporary $500,000 mark to $1,000.000 to consummate the deal. The Detroit plant will be used for making replacement parts not only for all future E-M-F cars but for all past models of Waynes and Northerns, while the Port Huron plant will supply axles for the new product. In connection with the sale of a large part of the E-M-F output by the Studebaker Automobile Co., E. Le Roy Pelletier is to handle the advertising of all the Studebaker models.

Selden Celebrates a Christening.

The Selden Motor Vehicle Co., of Rochester, N. Y., gave a luncheon to its representatives and sales agents on the 30th ult., at which Louis Caswell, the new sales manager, was the guest of honor. George B. Selden, president of the company, related some of the history in connection with his own part in the industry, in addition to which there were a number of other speeches and a christening of the 1909 model.

Engineers Have Employment Bureau.

Manufacturers seeking additions to their technical staffs are now given the opportunity of consulting an information bureau which has been established by the Society of Automobile Engineers and in which will be kept the names and qualifications of members seeking new positions. For the present the bureau will have its headquarters with the secretary of the society, at 231 West 39th street, New York City.

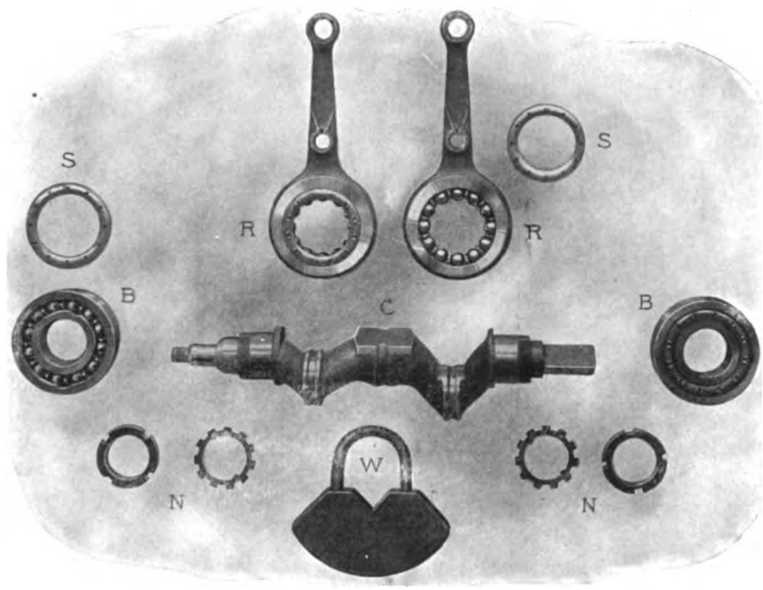
Regal and Oakland are Members.

The Regal Motor Car Co., of Detroit, Mich., and the Oakland Motor Car Co., of Pontiac, Mich., have been admitted to membership in the American Motor Car Manufacturers' Association. The latter company will show at the Grand Central Palace.

YEAR'S LOSS BY GARAGE FIRES

Insurance Company's Figures Approximate Total of $2,000,000—Careless Handling of Gasolene Largely Responsible.

Preying upon both the trade and the private owner, but particularly upon that portion of the trade engaged in the garaging of cars, fire has during the past year caused recorded losses approximating $2,000,000, while the losses that have not been made a matter of public record doubtless aggregate hundreds of thousands of dollars more. As showing how great is the fire hazard on garages and automobiles from an insurance standpoint, one of the leading New York fire insurance companies has prepared a list of the more important losses in such risks in the United States from September 18, 1907, to September 22, 1908. This forms a record of an even hundred fires, with the damage in each instance ranging from $500 to $500,000. The total shown for the period is $1,893,700, comprising damages to buildings and equipment, and to cars. Some 40 per cent. of the total number of fires occurred in public garages.



Gasolene handled in a more or less careless fashion is the preponderating basis of damage, a very large proportion of the causes assigned having to do with the accidental ignition of the fuel or its vapor while replenishing cars or as a result of leaky tanks. Some of the fires have had an incendiary or a spontaneous combustion origin and in at least one case lightning was responsible for a conflagration. Another big fire was due to an acetylene gas explosion; but such instances are only a sprinkling among the more regular and monotonous repetitions of the unexpected flaming up of gasolene.

In the details of the manner in which the fuel or vapor became ignited it is shown that a great part of the total number of fires were started while fuel tanks were being filled—a proof of the dangers that exist in connection with this operation if the greatest care be not exercised in extinguishing lamps, stopping the engine, prohibiting nearby smoking and the taking of other precautions. Even the manipulation of electric light wall switches giving a long spark or flash when the circuit is broken, presents a danger, while the testing of dry cells near open gasolene was in one instance the cause of the place going up in flames.

That the insurance rates asked on many risks are excessive may seem very apparent to the would-be insurer, but in the face of the facts presented by the record for the year, the insuring companies have reason to regard the fire hazard in the automobile business as being far above the normal. In many localities the rates are being raised because of the heavy recent losses on garage risks.

The Simplicity of
THE WHITE STEAM CAR

In the principles of construction—as in the method of operation—the White Steam Car is simpler than any other type of automobile. Consider, for example, the design of the White crank-shaft and compare it with the corresponding member in other cars. In the above illustration is shown the crank-shaft of the 1909 White engine and all the parts attached thereto. The crank-shaft, C, is a short one-piece forging of tool steel with but two main bearings, B,B. These bearings may be removed by taking off the lock nuts and lock washers, N,N. The two connecting rods R,R, are one-piece forgings fitted with ball bearings, as shown. With the addition of the counter weight, W, the crank-shaft is complete.

In all accepted types of gasoline engines there are from three to seven main bearings. As is well known, when any shaft has more than two bearings, there is the ever-present danger that they will work out of alignment. Moreover, the crankshaft of the gasoline engine has either four or six connecting rod bearings, which are invariably only plain bearings instead of ball bearings. It will thus be seen that there are only from one-half to one-third of the number of parts used in connection with the White crank-shaft as are used inconnection with the crank-shaft of a gasoline engine.

Next week we shall compare the two valves of the White engine with the eight or twelve valves of the gasoline engine.

Write for circular containing details of the new White cars.

NEW YORK. OCTOBER 8, 1908.

Winning the Carriage Trade.

As has been pointed out frequently during the past two or three years, the carriage making industry and more particularly the carriage dealer is constantly growing into closer accord with the automobile industry, its spirit and its aims, and is coming to share more seriously its burdens. Were visible confirmation of this fact required, no more convincing evidence could be brought forward than is obtainable at the fifteenth annual exposition of the National Carriage Dealers' Protective Association which is being held at the Grand Central Palace, New York City, this week. Not alone is it true that along side the forty-odd exhibits of finished carriages are the exhibits of nearly half as many manufacturers either of finished automobiles or automobile components designed especially for consumption by the carriage trade. The attitude of respect for and interest in the automobile manifest by the attending dealers in this purely trade gathering is in itself impressive and expressive of a movement which is destined to be of more than passing importance to the newer industry.

Another side of the matter is revealed in the attitude of the automobile makers who have placed their representatives on the floor. Their respect for the carriage dealer and in many instances the earnestness with which they are seeking his patronage is, perhaps, significant of a new order of things in the methods of marketing the motor vehicle. The average repository of the carriage dealer, in town or country is greatly at variance with the average automobile salesroom. The spirit which pervades it and the attitude of its tenants with respect to business is equally foreign to the air which pervades the typical automobile establishment. Regardless of the apparent disparagement between the two lines, the fact remains that the carriage dealer is a merchant of recognized standing in the community and that he handles a staple line and deals with a class of buyers with whom the automobile maker is in many instances particularly anxious to get in touch.

Considered in the broadest possible spirit, it is difficult to under-estimate the advantages to be derived from marketing the automobile in a way which is calculated to reach the great masses of buyers on the plane of their understanding. The dashing, extravagant phase of automobiling with its appeal to certain classes of customers must be considered as distinctly apart from the soberer field wherein are considered only the matters of dollars invested and dollars earned. The commercial vehicle movement has its strongest feature just at present in the service which the passenger automobile can be made to perform where transportation is a daily necessity. This is a harder market to exploit than that of the purely recreative vehicle and therefore one which must be handled with combined economy and aggressiveness. For this purpose the carriage dealer is attaining a recognized standing among the makers of a certain farseeing class, and there can be no question that his experience and ambition are destined to be of great value to them.

Steering Gear Considerations.

Instructions as to the handling of cars, particularly on the garage floor are never considered complete without the precept that the steering gear should not be actuated from the hand wheel except when the machine is moving under its own power. Otherwise, it is stated, and with perfect truth, the heavy load thrown upon the parts when the front wheels are swung is apt to injure them to a serious extent. Taken in connection with a broad criticism of steering gear design in general which is printed in another column, opportunity is opened for reflection as to whether the continued iteration of this caution is not an acknowledgement of unnecessary weakness on the part of the average mechanism. Not that its inability to withstand unnecessary stresses applied in the reverse direction is absolute proof of inefficiency, but that it may indicate a condition which is, to say the least, undesirable in what is beyond question the most important mechanical system in the vehicle.

On a purely theoretical basis, the rolling action of the front wheels when swung; the fact that the only strains upon the connecting linkage are those injected by roadside obstructions; and the consideration that the inevitable "spring" of the rods, together with the give of the elastic connections—should be sufficient argument in favor of a mechanism no heavier than that commonly employed. At the same time it must be conceded that these are not the only strains to which the steering gear is subject; that the motion of the chassis over the axle, the vibration of the entire fabric and the errors due to possible disalignment of parts, subject the gear to loads which are beyond calculation, and that even the stresses commonly reckoned with, may at times increase to utterly disproportionate amounts. Hence it is open to question whether the average steering gear really is heavy enough for the work which must be thrown upon it in actual service under extreme conditions.

The old-time fallacy of ascribing every serious accident suffered when running at high speed to some defection of the steering mechanism is pretty well exploded. At the same time there can be no question that the number of accidents occurring from year to year, which are actually blameable to this source is far too great to conduce to the peace of mind of the nervous passenger in the swift-moving car.

After a period of comparative security lasting over several years, makers at length arrived at the conclusion that the average dimensions of the brakes were too small for the duty they must endure. Consequently a general increase in brake sizes has occurred which is equally to the credit of the

Digitized by Google

builders and the safety of the owner. It may be that the near future will witness an equally general strengthening out of the steering system. Certainly such a change would add to the mental security of the driver, if not the physical, while in the matter of expense and weight added to the car, it would involve little or no serious complications.

Minimizing the Fire Risk.

Nearly two million dollars' worth of damage to the industry brought about in the brief space of one year by fire losses, and in many individual instances caused directly or indirectly by the presence of gasolene vapor in and about cars or garages, is a record too serious to be ignored. Despite an abundance of legal measures restricting the handling of the volatile fluid, despite the natural precautions of wise property owners, an average of more than eight fires of this sort are reported monthly. What minor, unreported losses occur, and how far they may go to swell the actual total is beyond conjecture. Certainly the figures write a sober lesson of the need of caution in the housing and maintenance of cars.

There are absolutely no phases of the automobile fire risk which have not been investigated or which may not be guarded against successfully, save those which arise from outside sources of conflagration. For the storage of gasolene, ample provision is made by the makers who specialize in the construction of tanks and reservoir systems of various approved patterns. For the handling of the fluid while replenishing the tanks of cars, equally safe means are provided. Modern garage buildings are designed with a view to the riddance of the perilous fumes, heating and lighting appliances are protected, and due provision is made for the absorption of waste oils and fuel drippings. Despite these precautions, however, the careless attendant and the ignorant floorman will persist in "taking chances," in washing down motors with gasolene, leaving small quantities standing about in open tins, and slopping quantities on the floor.

The situation in the small garage, particularly the private stable, of course is different. It seldom happens that conditions are right for the safe handling of the oils, and generally the fire risk is increased by the inflammable nature of the building. At the same time, the fact that more fires occur in public garages than in private ones is in itself proof that the construction of the building and its equipment is not the absolute guarantee of safety that might be imagined. As a matter of fact the real secret of safety rests with the administration of the public institution, even as it rests with the "fussiness" of the private owner.

There is a deplorable lack of discipline about most garages—chargeable, perhaps, to the influence of the bumptious private chauffeur—which is directly counter to the principles of safety in this as in other matters. Where it is possible to carry out a close system of routine work for each employe, and to exercise a watchful supervision over the doings of each, there it is safe to say the fire risk, which is perhaps the greatest menace the garage proprietor has to face, is at its minimum.

Designing for Practical Results.

Schemes almost beyond number arise and thrive in the brain of the designer—"pet ideas" for the improvement of this or that part, grand notions for the complete rehabilitation of an entire model, plans for enlarging the scope of the product through alterations in design. And because these little offshoots of his labors are not invariably accepted at face value by his employer it not infrequently happens that the otherwise capable and efficient engineer becomes a victim of the impression that he is not appreciated. As a matter of fact, however ambitious the manufacturer may be, and however much inclined to follow the lead of his engineering corps, he also is under the thraldom of a monster called the business department. However much he may desire to improve his product he may not do so wisely except in ways which promise a direct return. It is this principle which explains a number of little structural economies in many up-to-date cars, which the layman, and in many instances the designer himself cannot appreciate. Incidentally the engineer who is far seeing enough to invent and propose only such modifications as are patent necessities or obvious winning features, is usually the one who best proves his worth to his employer and the public.

It is pleasing to observe the gradual change of attitude manifest in foreign trade circles toward the American branch of the industry. Early acknowledgement on the part of American builders of the then supremacy of the foreign product, particularly as made on the Continent, led to the erroneous impression that the American manufacturer lacked the power of originating except along wildly radical lines. American cars were scorned as being either copies of foreign designs or else needlessly original.

It has come about in the process of time, however, that the same respect for unfettered invention which is manifest in the foreign makers' use of American machine tools also has been transferred to other products. Thus in parts, accessories and even in complete component groups, the foreign maker has come to draw upon the American market to a very considerable extent—more so, perhaps, than is generally known. A recent case in point is the adoption of a complete motor of such unusual design as to constitute one of the most striking innovations seen for several years among foreign makers of recognized standing. For this, due credit is given, though somewhat grudgingly, to its American origin, and the widespread publicity accorded its adoption constitutes a strong though possibly unwitting testimonial to growing respect for the over seas product.

COMING EVENTS

October 6-9, Chicago, Ill.—Chicago Motor Club's 1,000 miles reliability run.

October 10, Philadelphia, Pa.—Quaker City Motor Club's 200 miles road race, Fairmount Park.

October 10, Long Island—Motor Parkway sweepstakes for stock cars.

October 10, Providence, R. I.—Rhode Island Automobile Club's race meet, Narragansett Park.

October 14-16, Cleveland, O.—Cleveland Automobile Club's reliability run.

October 15, 16, 17—Michigan State Automobile Association's endurance run.

October 17, Hartford, Conn.—Automobile Club of Hartford's hill climb, Avon Mountain.

October 17, New York City, N. Y.—New York Automobile Trade Association's hill climb, Fort George hill.

October 17, Kansas City, Mo.—Automobile Club of Kansas City's race meet, Elm Ridge track.

October 24, Long Island—Vanderbilt Cup contest.

October 31, Philadelphia, Pa.—Automobile Club of America's 200 miles light car race.

November 23, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

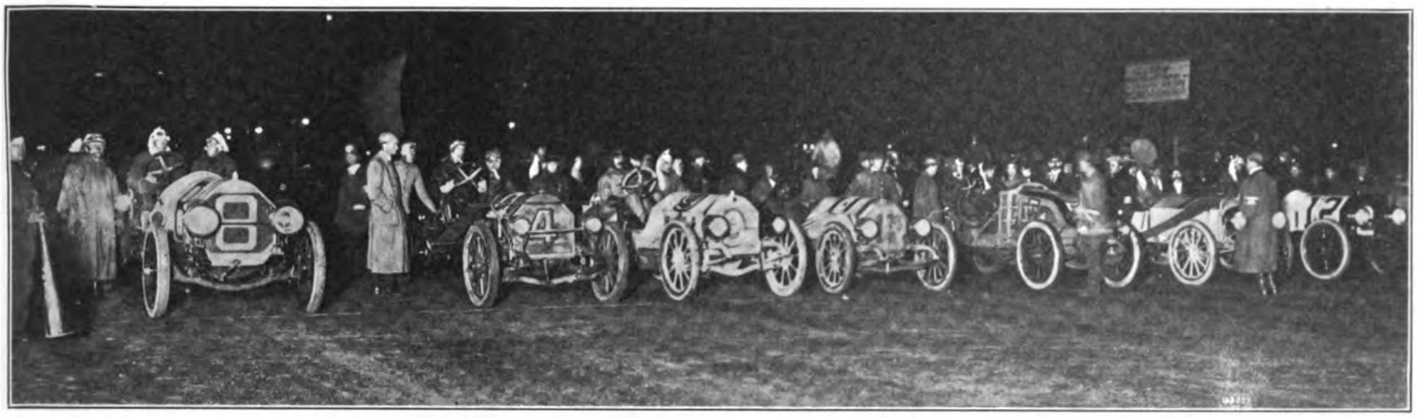
ROBERTSON REELS OFF 1,177 MILES

Simplex Driver Wins 24 Hours Race at Brighton Beach—Accidents Eliminate Half the Contestants.

After repeated hard luck in 24-hour contests, George Robertson, with Frank Lescault as alternate, driving a 50 horsepower Simplex car entered by Charles A. Singer, won a decisive victory in the twice-around-the-clock race at Brighton Beach on October 2 and 3. Robertson crossed the finish line with 1,117 miles to his credit—a remarkable performance. While the 24 hours world's record made by S. F. Edge, made on the specially banked cement track at Brooklands, England is still unapproached, nevertheless Robertson's mileage exceeds all other records made on ordinary dirt tracks, and beats Bernin's Morris Park Renault record of 1,079 miles by a big margin. Twelve contestants faced the starter and of this number only six were running at the finish.

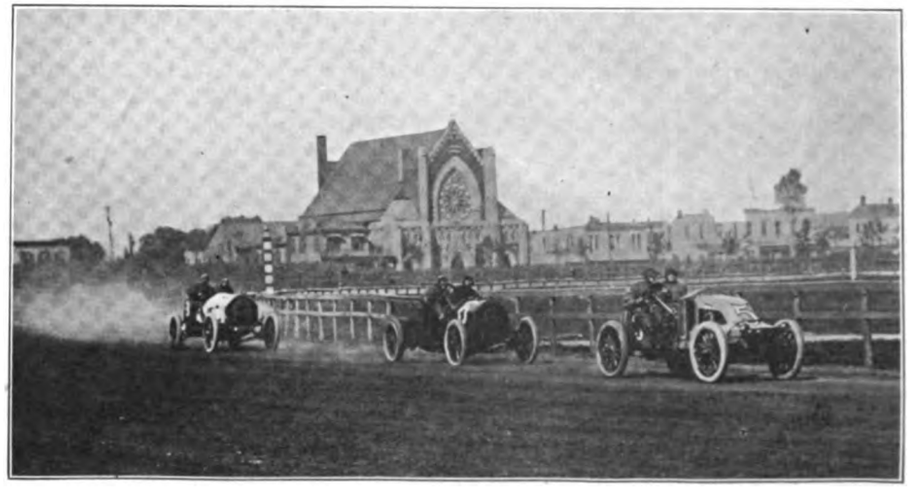
The event was run under the zealous management of the Motor Racing Association and was sanctioned as an international race by the Automobile Club of America. Despite this most of the drivers were under the ban of disqualification at the hands of the American Automobile Association for participation in a former unsanctioned event. The rite of absolution granted by the latest ruling of that august body, however, is calculated to whitewash the sins of those who labored under a "misapprehension in the matter of sanctions."

Ralph Mulford and Harry Cobe in the same Lozier "six" that won the last 24 hours contest at this track, scored second place with 1,125 miles to their credit, and Montague Roberts, in a six-cylinder Thomas, with Martin and Winter for alternates, captured third, after covering 1,115 miles.



The Allen-Kingston, piloted by Lanwell, Rippengille and Pepperday, came in for fourth place with 907 miles; Chevrolet, in the Cleveland which cracked two cylinders and lost seven hours in repairs was fifth with 632 and the Stearns, which Marquis, Laurent and Oldfield handled, was the only other to finish, having gone less than half the distance the leading cars covered, owing to an unfortunate smashup.

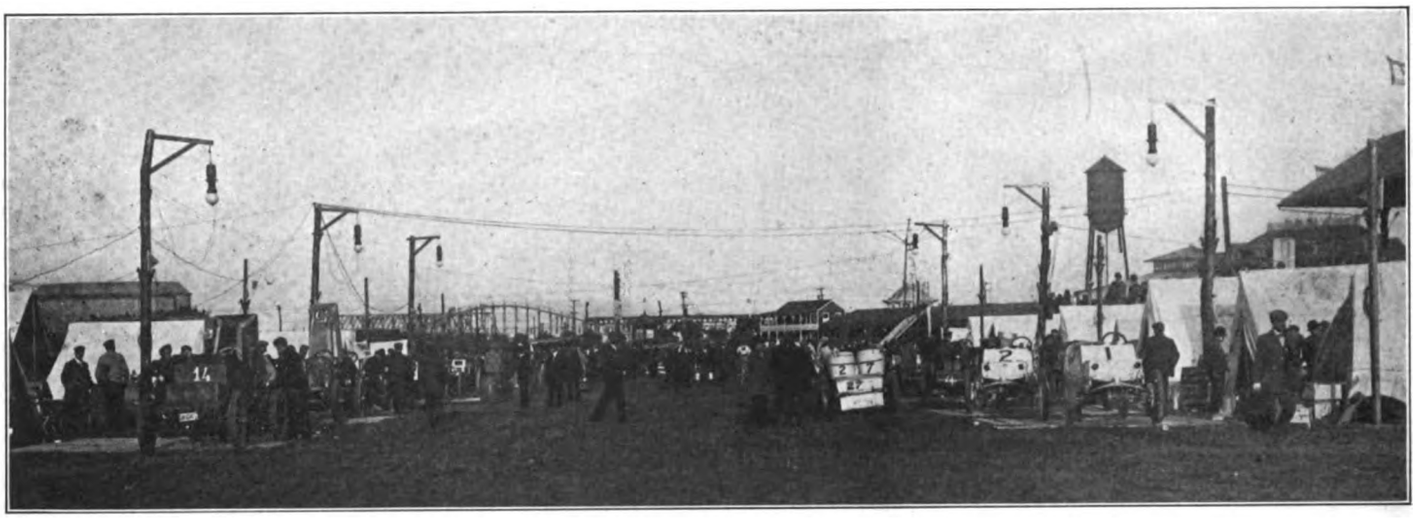
Lewis Strang, who guided Paul La Croix's Renault, was a victim of big misfortune. He and Basle, his alternate, had been fighting Robertson for the lead for more than 18 hours, the Renault and Simplex taking turns at leading the field, when Strang's car suddenly snapped a connecting rod and damaged the cylinder to such an extent that it could not continue.



Due credit should be accorded to Charles A. Singer for his persistence in entering the Simplex in contest after contest, despite its failure to secure the first places he was confident of its ability to earn. Robertson, who has had more than one unfortunate experience, drove a splendid, daring race and can be counted on to be a worthy contender in the Vanderbilt three weeks hence. Robertson used Michelin tires throughout, as did Strang. The second car used Continentals, and Diamonds got third place.

Just before starting time, an accident prevented two of the big contenders from getting into line. Ed. Young, who had been practicing with the Garford entry, was ordered back to the paddock and while switching into the gateway from the center of the track, was run into by Harry Michener, who was trying out the four-cylinder Lozier. As the latter rounded the turn, he failed to see Young in time to dodge him. The frames and rear axle of both cars were so badly shattered that neither could enter the long race, although the start was delayed for nearly three-quarters of an hour in order to allow the Garford crew to attempt necessary emergency repairs.

It was a spectacular start, such as characterizes all 24 hours races which begin at night. When the cars tore away at 8.46, Robertson jumped his Simplex to the front and led around the first turn, with Roberts's Thomas "six" on the pole, sticking close. Marquis in the Stearns was third and Martin, in the four-cylinder Thomas, fourth. The cars bunched and were so enveloped in smoke that it looked as though a smashup must be inevitable before the initial turn was rounded. Robertson led the pack around the upper curve and swung into the stretch ahead, when the New York-Paris driver opened up his Thomas and completed the first lap on about even terms with the



LINED UP FOR START OF THE TWICE-AROUND-THE-CLOCK RACE

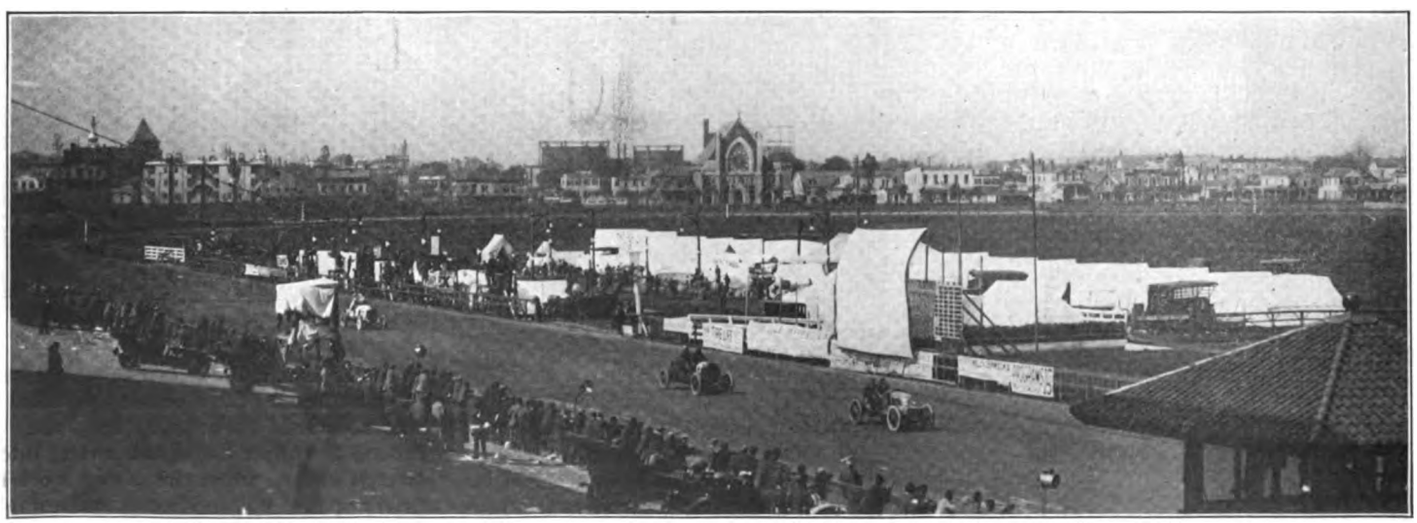
Simplex, trailed by Marquis and Martin. Roberts out-generaled the first driver to the turn ahead and forged into the lead; these two drawing away from the string and keeping in a clear field at a furious pace. Then ensued a hot bout between the two pilots whose names are similar.

The ten miles mark was passed in 11:32 and the leading cars held the same relative positions until the 23d mile, when Roberts's Thomas suffered from a choked fuel line and was forced to retire to the paddock and lose a lap. Robertson seized this opportunity and kept up the pace.

He made 40 miles in 44 minutes and when the first hour struck, he had covered 55 miles, which is 3 miles better than the distance made by Bernin's Renault at Morris Park last year. Strang had 54 miles to his credit for the first hour, while Mulford was third with 51, and Marquis fourth with an even 50.



Roberts had returned to the track in the meantime, but trouble with tail lamps set him back so that he covered only 49 miles up to this point.

At the end of the second hour, the leaders were in the same positions; Robertson with 107 miles chalked up, and Strang giving a good account of himself with 105, and keeping Mulford in third position 6 miles behind the leader. Then the accident lists were reopened.

Shortly after 11 p. m. a special policeman named Fickert, unfortunately attempted to cross the track and was struck by George Robertson's car, with fatal results. The man evidently was not heeding the approaching machines, or else misjudged their speed, for he was overhauled by a trio of cars. Strang and Chevrolet barely missed him, but Robertson was directly behind and could not avoid striking the man, although he applied his brakes so quickly that Marquis telescoped the Simplex, smashing the Stearns's frame and headlamps. Lescault at once relieved Robertson at the wheel of the Simplex and started out for Strang, who had secured the lead, with the Lozier and Roberts's Thomas in second and third places.

The excitement had hardly subsided when Harry Cobe, who had relieved Mulford in the Lozier, blew up a front tire and skidded into the outer fence. The car ran into a ditch, the shock throwing out the mechanician, who landed in the mud unhurt. After being hauled out of the mire the car was soon touched up and put back on the track, although Cobe had lost his advantageous position. In the mean time, Lescault had been doing some tall work with the Simplex, fetching it past Roberts, and was running second to Strang at the end of the fourth hour. The latter had covered 211 miles up to this point, 18 miles ahead of Morris Park figures. Strang held this lead for six hours, with Lescault at close range all the time; then in the tenth, the Simplex driver regained first position, holding it for two hours until Strang capped him in the twelfth. It was then a continuous duel between these two until the 19th hour.

In the mean time, Roberts and Mulford were fighting for third notch. Roberts passed the Lozier in the fourth hour and held his own for third place until the eighth, when Mulford again eclipsed him. For

Digitized by Google

hours these two kept alternating for the position with only a few laps margin between them.

About 2.30 a. m., Saturday, there was another sensational accident. Bloch's Renault overturned in taking the lower turn and caught fire. Bloch and his mechanician were thrown out, but escaped with slight scratches, while the car was smashed and burned beyond repair. Immediately following this accident, Charles Natjen, the Zust driver, crashed through the outside fence, spilling both himself and his assistant, Harry Bertell. The latter landed uninjured, but Natjen's head was cut and his leg lacerated. Two cylinders of the Zust motor were smashed when a fence rail pierced the radiator.

The Fiat, driven by Capra and De Palma, withdrew with a broken connecting rod in the eighth hour. Martin and Blanchard's Thomas followed suit in the eleventh, and Patscke and Rodger's's Acme in the twelfth.

Until the 19th hour, Lewis Strang gave Robertson a good argument for the leadership, and just when the contest had reduced itself to a point where the winner could be picked from the quartet composed of the Simplex, Renault, Lozier and Thomas cars, Strang suffered the connecting rod accident referred to above and was forced off the list. Mulford then drew into second, closely pushed by Roberts.

At 5.45 Saturday afternoon the contest was stopped for half an hour to sprinkle the track and put it into condition for the finish. When the cars returned to the fray Robertson continued to push his Simplex around at high speed. He was leading by 60-odd miles and with but six other competitors on the track—only two of whom looked dangerous, the Simplex driver took a 45 miles an hour pace and was never headed. When flagged in the final round with 1,177 miles to his credit, he was 52 miles ahead of Mulford. The latter was pushed hard for second place by Roberts's Thomas, which was within four miles of the Lozier at the close of the 23d hour, although at the finish it had covered a total of 1,115 miles against Mulford's 1,125.

Previous to the start of the 24 hours race, a few short events were held on Friday afternoon. The principal feature was a 50 miles affair in which half a dozen cars started. Barney Oldfield entered two Stearns sixes, one of which he drove himself, the other being in charge of Charles Soules. Oldfield led the string throughout and won in 50:43, with his partner in second place. In the sixth mile, Steinmetz's Mercedes threw a tire and withdrew, while Kilpatrick's Hotchkiss went out later. Roux, driving a Mercedes, was third, trailed by Howard, in a Palmer-Singer.

In the mile trials, Ralph De Palma, driving the Fiat "Cyclone," circuited the track in 0:52⅕. The best George Robertson could get out of the Fiat "Tornado" was 0:58. When these two went in for a ten-miles bout Robertson was disabled in the fourth mile. De Palma's time for the distance was 9:45.

Barney Oldfield took the five miles six-cylinder race in 5:20⅘, out-classing Kilpatrick in the Hotchkiss, and Ray Howard in the P. & S. A special 5 miles match between De Palma, Oldfield and Robertson was captured by the former with the Cyclone, in 4:46. Robertson pressed him hard, but Oldfield, who had been jumped at the start, dropped out. The summaries:

One mile trials—Won by Ralph De Palma (Fiat Cyclone), 0:52⅕; George Robertson (Fiat Tornado), 0:58.

Ten miles special—Won by De Palma; Robertson disabled in fourth mile. Time, 9:45.

Five miles six-cylinder—Won by Barney Oldfield (Stearns); second, H. J. Kilpatrick (Hotchkiss); third, Ray Howard (P. & S.). Time, 5:20⅘.

Fifty miles race—Won by Barney Oldfield (Stearns); second, Charles Soules (Stearns); third, Roux (Mercedes). Time, 52:06.

Five miles match race—Won by Ralph De Palma (Fiat Cyclone); second, George Robertson (Fiat Tornado). Barney Oldfield withdrew. Time, 4:46.

BIG RATIO OF PERFECT SCORES

All Starters Finish in Indianapolis Sealed Bonnet Run—Fifteen Out of the Twenty-Six Escape Penalization.

When the Indiana Automobile Trade Association arranged its second annual sealed bonnet contest, which was held on Friday and Saturday, 1st and 2d inst., the technical committee laboring under the impression that the "perfect scores" at the end of the two days' run would be quite scarce, were in error, however. Twenty-six contestants set out from Indianapolis on the run to French Lick, Ind., and of this number, 15 returned with perfect scores. All of the cars made the round trip on schedule time and the only penalizations recorded were minor ones. The total distance covered was 254 miles, 131 miles being the first day's schedule, and the return 123.

The perfect 15 were the following; John Aitken, National; Thomas Kincald, National; H. G. Shafer, Marmon; H. Stillman, Marmon; Harry Hammond, Premier; Henry Letsinger, Premier; Miss Elizabeth Love, Premier; Frank Horrison, Premier; Ted Collier, Rambler; George Gasterneau, Mitchell; J. A. Newby, Maxwell; T. L. Marshall, Maxwell; J. H. Stickney, Chalmers-Detroit; Harry Hocker, Oakland, and O. G. Myers, Reo.

This run was through as picturesque a section of Indiana as could be selected and was considered a successful affair. The first day's run, via Millport Hill and Plattsburg, saw very few cars in trouble. The only accident was when J. A. Newby's Maxwell skidded into Harry Stocker's Oakland near Seymour and smashed off a lamp and fender of the latter. No one was injured. At Millport the cars were given a stiff climb up the steep two miles hill.

The return journey was made via Bedford, Bloomington and Martinsville, upon which there were numerous cases of tire trouble, Fred Tone's American roadster losing two whole hours with tubes, which, however, the driver managed to make up.

A great deal of amusement was created by Frank Grogan's Rapid Truck, which carried a dozen passengers, all dressed in prisoners' stripes. Two women drivers were among the contestants, Miss Elizabeth Love and Miss Katrina Fritz, while the ten-year-old daughter of D. M. Parry guided the wheel of her father's Overland entry part of the time.

San Antonio Meet Full of Incident.

Two smash-ups inside five laps was the record that J. W. Collins made during a short race at San Antonio, Tex., on Saturday, September 27th. In the first accident he merely crashed into a fence and was hurled about 20 feet in the air. Again, after the car had been righted and run two laps, Collins smashed down a second fence and completely upset. Following this, the driver desired to get into the race once more, but the car could not be made to run, much to Collins's chagrin.

In this race there were but two starters—Ben Johnson, in a Mitchell, and Collins's Buick. The former drove three laps and retired to the paddock for adjustment. Collins, who had been skidding badly on the turns, then slowed down slightly, but in rounding the next turn a tire blew up, the car swerved and shot through the rail. Collins picked himself up, looked around for the car and when he located it proceeded to shove it back on the course. In the meantime, Johnson had returned to the track and was well under way. After his second spill the crowd picked up Collins's scattered parts some distance away and reassembled him. He was feeling very well two minutes later, but did no more driving. The event was declared "no race," by the judges.

What was billed as the feature of the program was a 50 miles go between Dave Pryor's Stoddard-Dayton and Will Morrison's Thomas-Detroit. Pryor drove five miles and then surrendered the wheel to Alfred de Hymel. The two contestants fought nip and tuck for 22 laps, when de Hymel suffered a puncture which caused him to lose the race. Upon returning to the track he drove faster than Morrison, gaining a whole mile, but did not succeed in bridging the gap of ten laps. Just as the Thomas crossed the finish line de Hymel broke his steering gear and narrowly missed the fence in a bad skid. Morrison's time for 50 miles was 52:04⅗.

A novelty race was won by W. D. Syers driving a Chalmers-Detroit. The "novelty" feature of the contest was that each car carried five passengers, and was required to stop at every lap in front of the grand stand, "kill" the engine, unload and reload the passengers and then take a fresh start.

Tennessee Takes to Automobile Races.

After numerous fine thoroughbreds, selling platers, dray mules and common ordinary skates had raced around the half-mile track at Cumberland Park, Nashville, Tenn., on Saturday, 26th ult., the last day of the State fair, a few automobile races were reeled off as a wind-up. So enthusiastic were the people over the latter, that the management expects to feature motor races next year instead of the traditional equine sport of the past.

The principal race at the fair meet, a ten miles roadster event, was won by Joe Youell, driving a 30 horsepower Moon, who made the 20 circuits in 12:54⅗. Eli Coillette (Oldsmobile) was second. Youell also won the five miles for touring cars in 5:55, easily beating Duncan Dorris in a Dorris car. W. J. Cummings ran third with a 60 horsepower P. & S. The two miles event for small cars went to W. N. Norman, his Maxwell outclassing the only other entry, which was a Buick.

SEVENTEEN CONTESTANTS START

Two Divisions Begin Chicago's Postponed Reliability Run—Contest is to Cover Four Days of Running.

One thousand miles—no less—is what the 17 contestants in the Chicago Motor Club's postponed four days reliability contest set out to cover on Tuesday, the 6th inst. Quite a variety of cars was represented; 2 cylinder, 4-cylinder, 6-cylinder gasolene cars, steamers, and one motor buggy. All day Monday the technical committee spent in examining the cars and sealing the various parts.

The cars are to run over four different routes, starting from and returning to Chicago each day. The first day's schedule was 262 miles, the route passing through Kenosha, Wis., Janesville, Wiss., Rochelle, and Geneva, at which points controls were located.

Contestants were split into two divisions, runabouts and touring cars, and then subdivided into selling price classes, each car carrying an observer. The starters were:

Driver and Car.	H.P.	Cyl.
C. L. Halliday, Reliable Dayton	21	2
J. Montweiler, Maxwell	20	2
F. S. Dusenberg, Mason	20	2
F. M. Harn, Mason	20	2
N. McLain, Apperson	30	4
E. W. Nicholson, Midland	32	4
P. Hoffman, Pierce-Arrow	43	6
F. H. Nutt, Haynes	36	4
R. F. McNamara, Premier	32	4
J. G. Heaslet, Rainier	45	4
W. Leitch, White steamer	30	2
H. K. Sheridan, White steamer	30	2
L. E. Springer, Franklin	28	4
L. Wagoner, Haynes	36	4
Geo. Smithson, Studebaker	27	4
Joe Moore, Premier	Official car	
H. G. Shafer, Marmon	50	4
A. Kumpf, Pierce-Arrow	60	6

Tie Unbroken in Boston's Contest.

After covering 1,622 miles, the three survivors who were endeavoring to run off the Boston-Bretton Woods 24 hours endurance contest tie, agreed to quit on Thursday evening, 1st inst. The three of the twenty-two original starters who still held perfect scores at the end of the sixth day's attempt at evolving a winner, were a Studebaker, driven by W. G. Jones and R. W. Daniels; Dan Carris's Franklin, and the Shawmut car with Ayer and Church as pilots.

The contest was run under the most stringent and exacting rules, much of it being under weather conditions as well. At the close of the original 24 hours run which started at 10 p. m. on Septemmer 23, from Boston, running to Bretton Woods, N. H., and return, there were only nine of the 22 contestants left with perfect scores. Seven of these started out next day to run off the tie and the list was soon cut down to three. The Bay State Automobile Club is still in possesion of the $200 silver trophy.

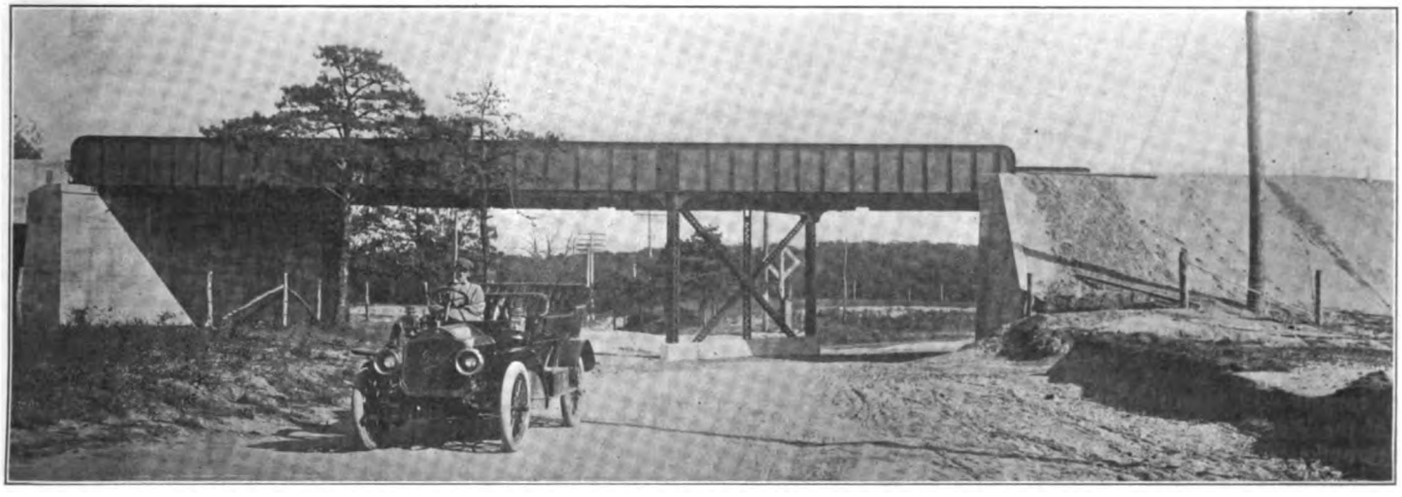
ENTRIES FOR THE SWEEPSTAKES

Good Program for Inauguration of the Long Island Motor Parkway—Arrangements for the Opening Day's Racing.

Long promised and eagerly awaited, the formal opening of the Long Island Motor Parkway on Saturday next, October 10th, forms perhaps a more fitting introductory to the Vanderbilt Cup contest than would the simple elimination race which it displaces. That the Sweepstakes itself is destined to be one of the most eventful races ever run in this country is emphasized by the fact that no less than 34 cars of varied powers and size will be in simultaneous competition and constantly passing and repassing one another. No less interesting than the comparison of the performances of the different cars, will be the opportunity to compare the relative performance of each on the macadam of the common highway and the scientifically prepared surface of the Parkway. For of the 25 miles comprising the circuit to be traversed, about 10 miles will be over the new-laid and practically untried concrete of the private way.



The complete list of entries to date, arranged in order of their classification in the race, is tabulated below.

By the terms of the race, all the contestants will start in a single heat within 30 seconds of each other, regardless of the class distinctions. The smaller ones will run 100 miles; the next class 150; the third, 200; the fourth, 225, and the high-powered, high-priced cars will go 10 laps, or 250 miles.

There will be only two supply stations on the circuit, one in front of the grandstand, which is sunken below the level of the parkway about five feet for the storing of the water, gas, tires, tools and spare parts. This idea of having a depressed supply pit originated abroad and has been tried with very satisfactory results in big European contests. Crews in charge of the supplies will remain in the pit and any driver desiring to make a change of tires or to take on supplies will stop in front of the station allotted to his crew. The men in the pit will pass up supplies to him and no one will be allowed to work on the car except the driver and his mechanic.

The other supply station will probably be located on the Jericho turnpike about 12 miles from the grandstand. Drivers will not be allowed to take on tires or supplies except at these places, but they may make any adjustments necessary on other parts of the course. The entire circuit is supplied with telephone stations and an immense score board has been erected on the roof of an official stand opposite the grandstand.

The entire parkway is fenced in so that it is now impossible to enter it except through one of the three toll lodges which have been established at Meadow Brook, Massapequa and Bethpage. The Meadow Brook Lodge, which is situated at the eastern entrance, is reached by the Old Westbury road which intersects the Jericho turnpike about three miles east of Krug's corners. From the intersection of the old Westbury road and the Old Country road, which leads directly to the parkway from

the Garden City Hotel, a new dirt road 22 feet wide has been built and winds south across the Hempstead plains, terminating at the Meadow Brook Lodge.

From here the general direction of the Parkway is east, practically paralleling the old country road. The start and finish is midway between the Meadow Brook and Massapequa Lodges. The other lodge is about four miles east of Massapequa, and here the racing cars will leave the cement and turn through a new cut-off which joins what is known as the Round Swamp road. Traveling almost due north along the Round Swamp and Plain View roads the racers will have a very fast but somewhat narrow stretch to travel with a few slight grades and several winding curves. There are no sharp corners until they reach the intersection of the Woodbury turnpike and the Jericho turnpike, where there is an abrupt right angle turn on to the latter famous thoroughfare.

STEEL GRANDSTAND WITH SEATS FOR 10,000 SPECTATORS

Vanderbilt Entry List May Reopen.

While the closing date for entries for the Vanderbilt cup race was announced as October 1 —a date extended from the originally scheduled closing time, September 1 —the Vanderbilt Cup Commission has not yet decided whether to consider the list absolutely closed or not. In view of the fact that there is a possibility of additional entries before the race takes place on Saturday, October 24th, the commission is considering a suggestion to extend the closing date still further and not charge an additional fee for post entries.

Fifteen cars have been entered to date, viz.: Paul Le Croix's Renault, which Lewis Strang will pilot; three Mercedes cars entered by Robert Graves, Wm. K. Vanderbilt, Jr., and Foxhall Keene; Harry Payne Whitney's Brazier, and Clifford V. Brokaw's Isotta, comprising six foreign entries. The nine American cars that have been nominated are, two Locomobiles, one of which will be handled by George Robertson and the other probably by Joe Tracy; R. W. Buckley's B. L. M. racer with Thomas Williams as pilot; two Knoxes to be driven by Bourque and Basle; a Chadwick, a Matheson and an Acme. The Mora, the first American entry, will not be completed in time to start.

PROVIDES REFUGE FOR "SINNERS"

A. A. A. Racing Board's Method for Easing Outlaws' Consciences—Meeting of Directors Called for Friday.

If any man who suspended himself by competing in the outlaw races on the Brighton Beach track in defiance of the rules of the American Automobile Association, desires to fill any other racing engagements, all he need do is to sign a statement that he competed under a misapprehension and that he will sin no more. After laboring hard and perspiring freely, the A. A. A. racing board has devised and offered this convenient refuge for all "sinners" and as most of the drivers concerned have engagements of the sort for Saturday next, in Philadelphia or on the Long Island Parkway, it is expected that a truly awful state of misapprehensiveness will develop. The manner in which the A. A. A. "whipped the devil around the stump" was disclosed by the resolutions adopted by the racing board at a meeting last Saturday, which are as follows:

Whereas, various persons have participated in races coming within the jurisdiction of the American Automobile Association, but for which no sanctions had been granted by that association; and

Whereas, It appears that from the statement of some of such persons they participated in the said races under a misapprehension; be it

Resolved, That in the cases of such participants as were under the misapprehension referred to their disqualification, pursuant to the rules of the racing board of the American Automobile Association, be suspended to the extent of enabling them to participate in any race already sanctioned by the racing board upon such persons filing a statement to the effect that they shall not hereafter participate in any manner or form in any race claimed by the association to be within its sole jurisdiction and for which no sanction has been granted by the racing board of the American Automobile Association.

While no mention is made of the entangled racing situation, President Hotchkiss, of the A. A. A., has called a meeting of the Board of Directors in New York tomorrow at which will be discussed "matters involving somewhat revolutionary changes in our organization and in the scope and functions of the association," which beautiful and profound phraseology is full of suggestion and nothing more.

Among the avowed purposes of the meeting are: (1) The adoption of proposed amendments to the by-laws which shall increase the scope and value of the association in the matter of touring information and the location of touring headquarters in New York City; (2) Amendments to the by-laws remodeling the framework and the purposes of the executive boards; (3) means whereby the activities of the association may be increased; (4) Suggestions as to the personnel of the executive officers and the heads of the boards for the coming year; (5) Whether the fiscal plan should not be materially modified and include a moderate flat fee for the clubs instead of graded annual dues.

Sixteen Entries for Philadelphia Race.

From present indications, the 200 miles race to be held in Fairmount Park, Philadelphia, on Saturday, October 10, promises to be a worthy rival of the Motor Parkway Sweepstakes which will be run on the same date on Long Island. When the list closed last week, 16 entries had been filed, which is the maximum number that can start, according to the Quaker City Motor Club's ruling. The course being but eight miles in length, this will permit cars to start on half minute intervals, and although additional entries would doubtless have been made before October 10, it was decided that more than 16 starters would make the race too dangerous. As it is, the last car will scarcely be started before the first will have completed its first circuit.

Practice on the Fairmount course began last Monday and many of the contestants were on hand at daybreak for tryouts. The course is not really dangerous for the most part, though there are two bad turns, one at Sweet Briar and the other an awkward left hand twist under the Reading railway tracks. The longest straightaway stretch is four miles in length along the West Park drive, where the racers expect to make the best speed. Road repairs have been in progress for several days, and the opinion of several drivers is that the course will permit an average speed of slightly more than 50 miles per hour.

The complete entry list is as follows:

	Cylinders.	H. P.
L. J. Bergdoll, American Locomotive	6	60
C. W. Kelsey, Maxwell	4	28
E. C. Ireland, Stoddard-Dayton.	4	34.5
Bert Maucher, Peerless	4	38
W. Wallace, Palmer & Singer.	6	60
George Davis, Apperson	4	48.4
E. R. Bergdoll, Welch	6	51
Frank Yerger, Studebaker	4	38.5
I. J. Morse, Locomobile	4	40
James Florida, Locomobile	4	40

EARLY GLIMPSE OF NEW MODELS

Motor Cars a Feature in the Carriage Dealers' Show—Commercial Vehicles and High Wheel Buggies in Evidence.

With what serious regard the carriage dealer has come to look upon the automobile industry is revealed unmistakably at the Fifteenth Annual Exposition of the National Carriage Dealers' Protective Association which opened its doors to the trade at the Grand Central Palace, New York City, on Monday of this week, 5th inst. Following a significant representation during the corresponding season of last year, a score or more of automobile makers and members of the allied accessory trades have staged their exhibits alongside of those of the old line carriage and wagon builders and are attracting more than their share of attention, numerically speaking.

Incidentally the show affords a semi-private view of a number of offerings which are destined not to be publicly unveiled until the forthcoming season of automobile shows. In the fourteen different makes of automobile which are staged are no less than eight which never have been shown in New York, the majority of them being new models and branded as of the vintage of 1909.

Over in a corner, quite apart from other vehicles, is the stand of the Ford Motor Co., where are shown in addition to the Models "S" and the "six-forty" the new Model "T," here revealed for the first time. Without going into the details of this machine, suffice it to say that it appears to be a remarkable achievement. In small details as the mounting of the hood, the ignition wiring, finish and equipment, it shows no sign of hasty production, but rather evidences a number of structural refinements which, considering the price at which it is offered, are nothing short of surprising.

Another exhibit which is well worthy of close attention is that of Thomas B. Jeffery & Co., where are four different styles of car in the various models. As a machine which has been exploited over an extraordinarily wide field among practical users, the Rambler has a well-earned place among the exhibits of the vehicle trade. Nearby is the display of Reo cars, staged by R. M. Quinn & Co. As representing the heavier and more luxurious type, are to be found the Glide in the full panoply of a seven-passenger touring car, and the Pennsylvania—the latter in the form of a Model "C" chassis, much the same as that shown last fall, but mounting one or two minor alterations, notably in the reinforcement of the rear axle mounting at one point or another—the changes being those which will characterize the 1909 version. Announcement also is being made here of a new Type "D" car, also known as the "25," and which though not yet ready for the market, is long past the early stages of production and will be publicly announced shortly.

An exhibit which is entirely new, in so far as the cars staged are concerned, is that of the Nordyke and Marmon Co., both of the new "Thirty-two" and "Fifty" models being on view in touring mounting. The smaller of these machines has the new type of motor which was recently described in these columns, a unit type, axle-mounted change gear system, expanding ring clutch, double expanding brakes, and a low, rakish outline which is pleasing in the extreme. The larger machine has the three-point suspended, subframe construction which has been a Marmon feature for so long, multiple disc clutch, selective change gear and a form of rear axle mounting which is as unique as it is ingenious.

Of a totally different nature is the exhibit of the Autocar Co., where are shown for the first time two variations of a brand new type of commercial vehicle which is of entirely original design. The features most noteworthy are the unit power plant mounting, in which are combined a compact 19 horsepower double-opposed motor, three-plate clutch and sliding gearset, together with a double reduction, bevel and spur gear rear axle group, which besides affording an easy step-down for the high-speed motor, affords also a practically straight line drive under load. All the elements of the machine are so disposed as to render access to the parts a matter of small effort and delay, while in the use of magneto ignition, heavy band brake on the intermediate shaft of the axle group, solid construction and generally lavish use of material, the closest attention to the rigorous demands of commercial service is evidenced. This machine is to be furnished in two lengths of wheel base and in various styles of body, under the general rating of 2,000 pounds capacity. In addition to the wagon bodies, however, it appears in a particularly attractive setting on a cab exhibit, where with only 85 inches of wheel base, and a vehicle without overhang, are disposed comfortable quarters for four inside passengers together with ample room for a fifth beside the driver.

More or less in a class by itself because of its unique structural details, is the exhibit of the Brush Runabout Co. Here both the runabout and light delivery wagon are shown in all their originality of wood frames and axles, helical suspensions and left side control.

As being logically allied to the horse-drawn vehicles, it would naturally be expected that the motor buggy representation would be a strong one, as indeed is the case. One of the most solidly built members of this group is the Reliable Dayton, which is shown in both the runabout form and the new commercial wagon, which has already been described in these columns. Aside from the very evident staunchness of construction peculiar to this type, the commercial vehicle embodies a number of notable details, such as the use of pressed steel frame, 20 horsepower motor, sliding gear transmission, double chain drive, and well thought out disposition of weight with regard to traction resistances. A pleasing little arrangement in the matter of convenience to the user, is the mounting of the combined coil and battery box on the dash board. The runabout model has undergone some slight modification since last shown, as in a half-inch increase in tire sizes, and the use of a new form of radius rod with double expanding brakes.

In the Paterson, the W. A. Paterson Co. are showing an entirely new production for the first time in the shape of a long, rangy runabout with the general appearance of the typical motor car, combined with the light lines known only to the carriage maker of long standing. It has 36-inch wheels, chain drive, planetary transmission, and a 14 horsepower, opposed, ball bearing motor placed transversely under a conventional bonnet in front.

Another newcomer in New York, is the Chase Motor Truck Co.'s "business runabout." This vehicle is equipped with a 3-cylinder vertical, air-cooled, two-cycle motor, located under a hood in front, planetary change gear and chain drive. It is mounted on 40-inch wheels, has 90-inch wheel base, and a plain open body of the Democrat type.

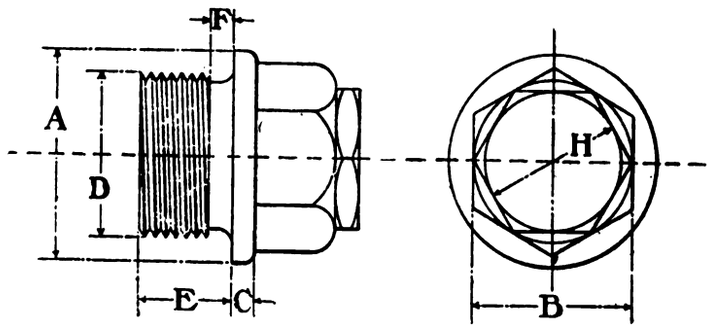
The offering of the Anderson Carriage Mfg. Co. is presented in two styles, both of the buggy type, with double-opposed, air-cooled motor disposed beneath the seat, and rated at 12 horsepower, planetary transmission and side chain drive. One has 36-inch wheels and 1¼-inch tires, while the other is a neatly done up approach to what in carriage parlance would be called the phaeton type. An important detail of this vehicle is the construction of the running gear which is framed up in a particularly substantial manner.

In the Schacht a number of minor alterations have been made since last show time, as in the case of the wheels, which are now 38 inches in diameter, instead of 31 and 40, front and rear; the wheel base, which has been increased by 8 inches; and the motor power, which has been raised from 12 to 16 horsepower. In other respects it is practically unchanged, and presents the novel arrangement of the friction transmission with floating disc surrounding the differential drum, which has characterized it from the first.

The Holsman display is noteworthy in that that pioneer maker of his class is showing for the first time an entirely new model known as the "gentleman's automobile," and embodying a number of original details of a radical nature. This vehicle, which is of the coupe type, has a central control pillar so contrived that the vehicle may be operated from either side of the seat. The most unusual feature is the mo-

Digitized by Google

tor construction in which a four-cylinder, four-cycle opposed mechanism of block construction, and given a rated output of 26 horsepower, is suspended on the countershaft, which, with the general plan of transmission, is a Holsman feature. In place of the usual crank and connecting rod construction, what may be briefly described as a version of the principle of the Scotch yoke is employed, and the pistons of opposite cylinders are tied together by means of a webbed connecting member carrying an annular ball bearing in which the eccentric member rotates. No gears of any sort are employed, the inlet valves being automatic in action, and the exhausts being actuated direct from the motor shaft without intermediate mechanism. Lubrication is effected through the medium of the gasolene feed, as in two-cycle practice. Another novel feature of the machine is the transmission system in which the cable drive which is employed on the other models is replaced by a steel chain of trapezoidal section which is employed frictionally over sheaves for the high gear, but on low and hill-climbing drive, is dropped into a sprocket by the spreading of the flanges on the driving sheave.



Among the parts and accessory makers are several names which are familiar to the automobile trade, though for the most part gaining representation here by reason of their alliance with the carriage industry through one or more of its many subsidiary channels. This is true of the exhibits of the Hartford, Goodyear and Diamond tire companies, the Sprague Umbrella Co., the Timken Roller Bearing Axle Co., and others. The list of automobile exhibitors and of accessory makers falling under this classification follows:

Anderson Carriage Mfg. Co., Anderson, Ind.; the Autocar Co., Ardmore, Pa.; the Bartholomew Co., Peoria, Ill; Brush Runabout Co., Detroit, Mich.; Chase Motor Truck Co., Syracuse, N. Y.; Ford Motor Co., Detroit, Mich.; James L. Gibney & Brother, Philadelphia, Pa.; High Wheel Auto Parts Co., Muncie, Ind.; Holsman Auto Co., Chicago, Ill.; Thomas B. Jeffery & Co., Kenosha, Wis.; W. H. Kiblinger & Co., Auburn, Ind.; Keystone Lubricating Co., Philadelphia, Pa.; Lewis Spring and Axle Co., Jackson, Mich.; W. P. Mallon, New York N. Y.; Nordyke & Marmon Co., Indianapolis, Ind.; R. M. Owen & Co., Iansing, Mich.; W. A. Paterson Co., Flint, Mich.; Pennsylvania Auto Motor Co., Bryn Mawr, Pa.; Reliable Dayton Motor Car Co., Chicago, Ill.; Schacht Mfg. Co., Cincinnati, O.; Sprague Umbrella Co., Norwalk, O.; Swinehart Clincher Tire and Rubber Co., Akron, O.; Consolidated Rubber Tire Co., New York, N. Y.; Diamond Rubber Co., Akron, O.; Goodyear Tire and Rubber Co., Akron, O.; Hartford Rubber Works Co., Hartford, Conn.; Rose Mfg. Co.,; Timken Roller Bearing Axle Co., New York, N. Y.; and Vehicle Apron and Hood Co., Columbus, O.

A. L. A. M. STANDARD SPARK PLUG

Complete Specifications as Adopted by the Mechanical Branch—Special Details That are Left Optional.

After the lapse of a considerable period the Mechanical Branch of the Association of Licensed Automobile Manufacturers has published the complete specifications of the A. L. A. M. Standard Spark Plug. As explained in the first announcements, the standard adopted calls for a ⅞-inch, 18 pitch plug in which a straight thread is used in place of the tapered pipe fitting at present in common use. The full working

A—ONE AND ONE-EIGHTH INCH (1⅛")
B—SEVEN-EIGHTHS INCH (⅞")
C—ONE-EIGHTH INCH (⅛")
D—SEVEN-EIGHTHS INCH (⅞")
E—NOT LESS THAN ONE-HALF INCH (MIN. ½")
F—NOT MORE THAN ONE-EIGHTH INCH (MAX. ⅛") (DEPTH OF RECESS—NOT OVER DEPTH OF THREAD)
H—THREE-QUARTERS INCH (¾")

details necessary to the construction of the plug are given in the accompanying draft, as printed in an official bulletin under date of October 1st.

In addition to the dimensions shown on the drawing the following specifications also are presented: The stock is to be 1⅛-inch, round; the head form milled hex. with a short diameter of ⅞-inch. The flange is to be circular, 1⅛-inch in diameter by ⅛-inch in thickness, the face to have an annular seat ⅛-inch wide, and suitable for a McKim type copper-asbestos gasket. The blank for the thread must be ⅞ inch in diameter and not less than ½ inch long. The recess adjacent to the flange must be not over ⅛ inch in width and of a depth not greater than that of the thread. The United States standard form of thread is employed, ⅞-18 in size and straight, cut perfect into the recess. The nut head for the packing gland is to be hexagonal in form with a short diameter of ¾ inch.

As the specifications for the standard extend only to the dimensions of the plug and packing gland, it is obvious that the type of insulation to be employed as well as its form and that of the sparking terminals is left open. Thus no restriction on the maker or user is involved in the adoption of the standard, and the vested rights of the accessory maker are in no wise encroached upon. At the same time the adoption of the standard thread, which has become pretty general already carries no small benefit to the trade.

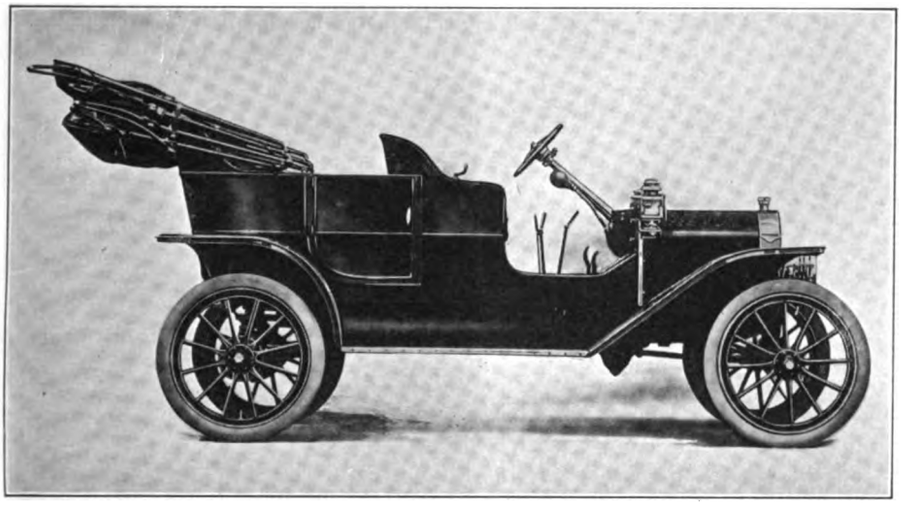
"Blue Blaze" a "Plug Within a Plug."

Giving a thing "blue blazes," is an expression not always fraught with the most complimentary of meanings. The phrase may be accepted in a new sense in the case of the automobile motor, however, in instances where the blaze is of the sort furnished by the Blue Blaze spark plug. This device is the most recent product of the Cleveland Spark Plug Co., Cleveland, O., and is being introduced as a "plug within a plug.' In other words, it possesses the advantage of having an enclosing shell which serves to protect the insulation and guard against the frequently serious troubles due to soot, oil and carbon. Like the "Cleveland" lug which springs from the same source, it is produced with scrupulous care and finished to micrometer gauge.

Tires that Make Their Mark.

If in the soft ooze or clay of a slippery road the motorist sees before him a ribbon of letters impressed into the road surface, reading "NON-S ID. FIRESTONE NON-SKID. FIRES TON"—etc., he may safely take it that the car ahead is equipped with the new product of the Firestone Tire & Rubber Co., of Akron, O., a feature of which is that the words "Firestone Non-Skid" are in raised letters around the big circumference of the letters themselves provide the non-skidding element, and are said to be highly efficacious.

A New Type of Solid Tire.



By vulcanizing a hard rubber base to a soft rubber body and tread, the Goodyear Tire and Rubber Co., of Akron, O., has developed a new type of solid tire for which great durability is claimed. P. W. Litchfield, superintendent of the factory, is credited with the invention of the process which makes possible the vulcanizing of hard and soft rubber together.

SIMPLICITY IN NEW FORD MODEL

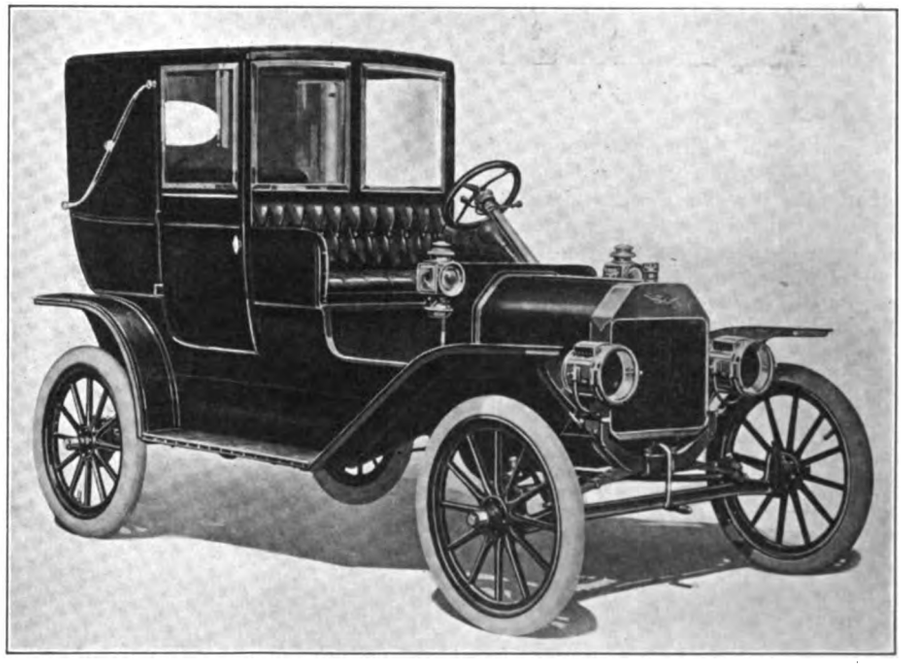
Unique Detail in Arrangement of the Power Plant—Novel Features in Suspension and Control Systems.

Although it was practically ready for production last January, so involved and painstaking has been the preparatory work incident to the marketing of a huge output that the long-promised Model "T" Ford car, was withheld until the first of this month before actually being launched. As announced three years ago, coincident with the introduction of the renowned Model "N," this machine is a light touring car modeled along the lines of safe and economical production which have earned for the Ford Motor Co. its eminent position in the field. Like the "N" car and its succeeding variations, this latest product of the big Detroit plant, is designed with a view to combining with extreme mechanical simplicity the most modern of structural advantages. In truth, the present result would appear to be quite as much a credit to the genius of Henry Ford as was the former achievement, though perhaps less spectacular from the point of view of the market.

FORD MODEL T TOURING CAR

The story of the car briefly told is as follows:

Engine: 4 cylinders, 20 horsepower; cylinders cast in block, integral with water jackets and upper half of crank case, the water jacketed cylinder head being a separate casting easily removable, permitting access to all working parts. Magneto generator, low tension, of original design, integral with the engine and driven direct by the crank shaft.



Transmission: Planetary gear, spur type, with large gears mounted on and forming part of weight of the fly wheel, which is back of the engine; unit mounting for gears and engine being an important feature; propeller shaft and live rear axle.

Lubrication: By a special splash system, the fly wheel being the distributing agent, oiling every part of the car except the wheels.

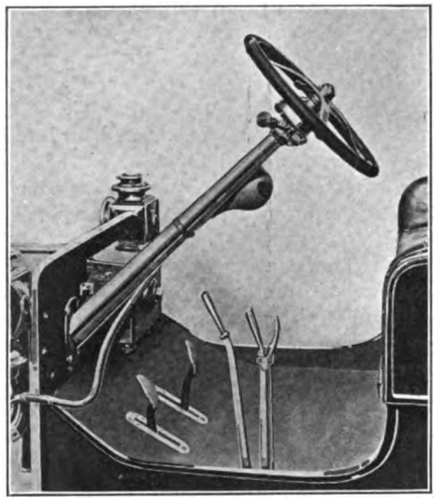
Suspension: By two inverted transverse springs; three point mounting employed in power plant, front axle, rear axle and gasolene tank.

The vehicle complete, carrying five passengers, running on 100-inch wheel base and weighing 1,200 pounds, is made to sell at the modest figure of $850.

Absolutely unique in detail is the arrangement of the power plant, which in one compact unit combines not alone the motor and transmission change gear, but such auxiliaries of the ignition and lubricating systems as commonly are mounted independently on the motor. The cylinder dimensions are 3¾ by 4 inches, bore and stroke, and, as just indicated, the entire aggregation of the 4 cylinders and the upper section of the crank case is cast integral. A second unit casting is the water jacketed head piece, the removal of which permits access to the piston heads and all valves and pockets. A third member forms the base chamber and extends rearwardly to the lower section of the fly wheel and change gear housing, also supporting the gears themselves.

FORD MODEL T TAXIMETER CAB

The fly wheel, which is placed behind the motor, fulfills the unusual additional functions of carrier for the gearset and rotor for the magneto. The entire revolving group of these two systems adding to the weight of the fly wheel, reduces the otherwise necessary bulk of that member, and adds to the simplicity of the design very notably. The magneto, which is of Ford design, is of the low tension type, without rotating conductors and very compactly built. The rotor is a part of the fly wheel; the stator with its coils, is a fixed spider carried by the fly wheel casing. There is practically nothing to become disordered owing to the protected location of the device, and its certainty of action is increased by the elimination of all supplementary driving chains or gears.



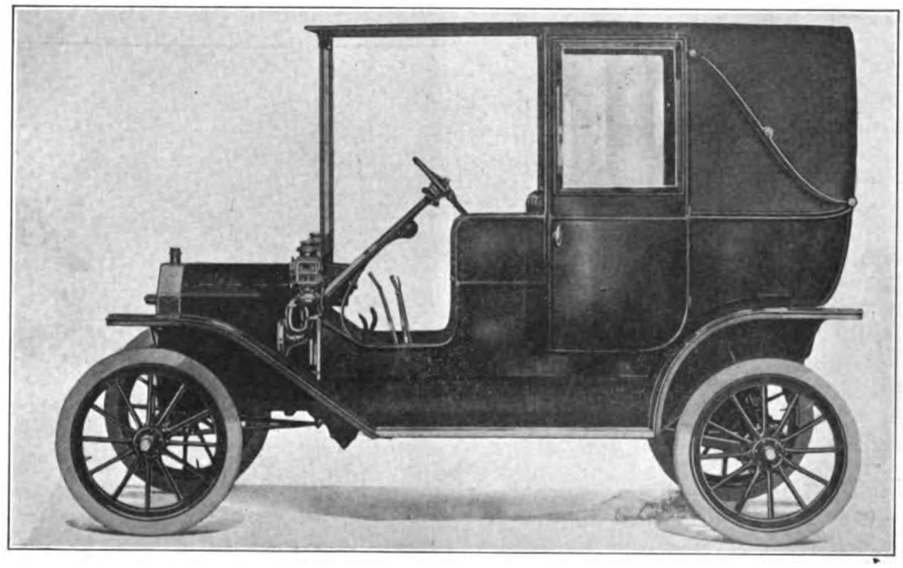
Due to the agitation of the fly wheel in its casing, the lubricant which is carried in a liberal bath extending throughout the power plant, is thrown up against the sides of its container and drained into feed ducts suitably arranged to feed all bearing surfaces not directly affected by the splash of the wheel or the cranks themselves. An ingenious arrangement of partitions provides for the retention of a constant oil level in the system.

The change speed gearing is of the familiar planetary type, the spur principle being adhered to, however, to the elimination of

Digitized by Google

all internal gears. The high speed clutch is of the multiple disc type, and the low speed and reverse bands are of steel—fiber lined—and designed for smoothness of application with elimination of the tendency to drag when out of use.

Aside from the novelty of the double-spring suspension, a noteworthy point in the mounting of the chassis is the arrangement for carrying the load, particularly in the case of the rear axle. For this the spring shackles, instead of being carried by the axle tubes in the manner common where elliptical springs are used, are mounted by means attached to the hub flanges. Thus, practically speaking, the only load which must be carried by the axle proper is the dead weight of the differential group and of the rear end of the propeller shaft. Further than this, the central and upper portions of the springs instead of being perched on the frame in the usual manner, are fitted into the section of the inverted U-sectioned cross members of the frame, while the latter are bent upward slightly to conform to the natural shape of the springs. By this means the loosening of the springs at their upper point of fixture is made practically impossible, while the frame itself furnishes a reinforcement which serves a very useful purpose in holding the alignment of the leaves.



CONTROL OF FORD MODEL T

The braking equipment comprises the service band on the transmission, which is under foot control, and the emergency pair which expand in the rear wheel hubs and are actuated by the side lever. The wheels are shod with 30 by 3½-inch tires in the rear, and 30 by 4-inch in front. The wheel base is an even 100 inches. The gasolene supply is carried in a cylindrical tank mounted directly on the frame and under the front seat, an unusual feature being the use of three-point suspension in connection with this mounting.

The mehod of control is novel in that the left side has been chosen for the driver's position as being the more logical for American use. The forward speed movements are handled entirely by means of the pedals, while the emergency brake and reverse gears are manipulated by side levers. The motor controlling levers are carried just beneath the steering wheel and are accessible without removing the hands from the wheel.

The standard type of touring body, accommodating five passengers embodies the usual lamp, horn and tool equipment as shown on the previous page. Variations in body mounting to follow as soon as production facilities are complete, comprise four other vehicles as well. They are the coupe, landaulette, town car, and runabout and roadster. Deliveries on the first three in order are announced to begin on the first of next month.

FORD MODEL T TOWN CAR

Matheson Makes Big Price Reduction.

Not only is the 1909 line of the Matheson Motor Car Co., of Wilkes-Barre, Pa., to be distinguished by a new car to sell at about $3,000, but three of the five models of the past season are to be reduced $1,000 in price, while the other two will have a $650 reduction. This is made possible, according to a statement by the Matheson Automobile Co., the newly organized selling outlet for the Matheson factory's product, by the new policy which both the manufacturing company and the sales organization have launched upon, following the recent expansion of the factory's financial resources, and which contemplates the doubling of the output and handling of its sale on a smaller margin than heretofore. With the exception of the new car, which will be shaft driven, all of the Matheson models will be like their 50 horsepower chain driven predecessors. The touring car, which up to this time has sold for $5,500, will be listed at $4,500, while the limousine and landaulet models, which have heretofore been held at $6,500, will list at $5,500. The roadster and tourabout models have in the past been $5,000, are to be reduced to $4,350.

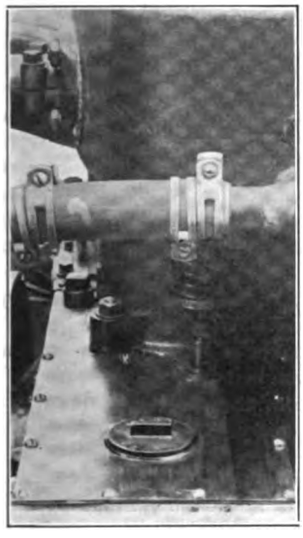
Paris Promises Motor Push Carts.

Motor push carts may seen be seen on the streets of Paris if the schemes of one Lionel Gervais are brought to fruition. Gervais has invented a system of motor propulsion for two-wheeled vehicles consisting of a small motor mounted at one end of the "chassis" and driving a countershaft placed at the other by means of the historic flat belt. From the ends of the countershaft, side chains lead to the wheels. By means of a lever mounted on one of the two handles by which the vehicle is balanced and steered, it is possible to shift the belt to and from a loose pulley to start or stop the vehicle. The system is designed for application primarily to replace animal traction in vehicles of this type.

When Valve Springs Become Weak.

Although there is small liability of a well made spring losing its temper or becoming permanently "set" through continuous use, still it occasionally happens that one or more of the valve retaining springs on a motor become weakened as a result of long continued use and so produce irregular running. In the case of a very old motor which has lost considerable power, a new set of springs sometimes will prove a wonderful help in restoring it to standard.

Motor Van for Race Horses.



Among the odd uses to which the commercial motor vehicle is being put abroad, may be mentioned a horse-van which is in use near Paris for the conveyance of racing studs. This machine, which may be described as a cross between a horse ambulance and a touring car, is of rather elaborate construction and provides safe and comfortable quarters for the animal passengers, as well as rapid transit.

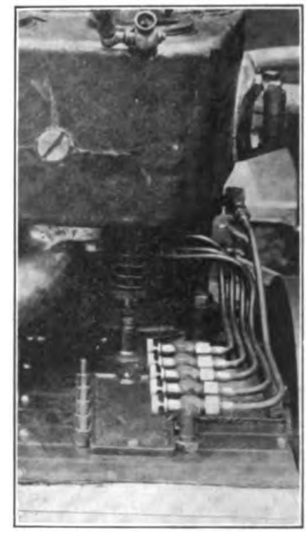
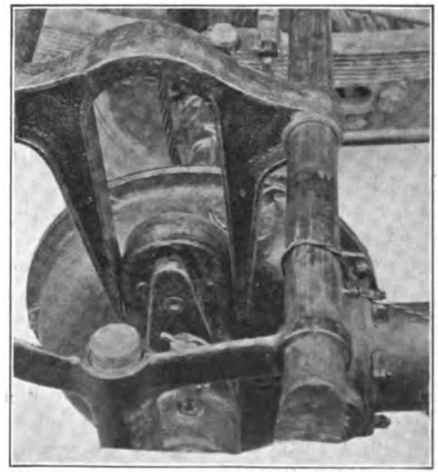
FEATURES OF HAYNES 1909 MODEL



Changes Include Increased Wheel Base and Larger Wheels—Noteworthy Characteristics that Have Been Retained.

As was announced some little time ago the Haynes Automobile Co., Kokomo, Ind., is preparing to make but one model during the forthcoming year, that to be known as Model "X." Final details of this car reveal it to be a successor to the current Model "W," in so far as the retention of its more conspicuous and original details are concerned, but differing from it in a number of important characteristics.



HAYNES MOTOR

Considered merely as a successor to Model "W," it has these modifications: Wheel base increased from 106 to 112 inches; wheels increased in diameter from 34 to 36 inches; roller bearings employed in mounting the crank shaft increased from 2 to 4; the steering column enclosed in a brass housing instead of a plain one, and the hand wheel increased in diameter from 16 to 18 inches; spring clearance raised from 4 to 7 inches; and as additional equipment the use of a gas tank, speedometer, trunk rack, tire irons, and the Bosch magneto.

Considered in the more satisfactory and fairer light of a new machine, it has a number of prominent features which are worthy of special mention. Among these and in connection with the motor the use of the double fly wheel should be indicated. The fact that this detail is held over from the previous model should be regarded as significant of its steadying effect upon the car as a whole and its influence in prolonging the life of the motor in particular. Outside of this peculiarity, however, the motor has a number of features which recommend it to consideration.

The cylinders are cast in pairs with water jackets integral—both inlet and exhaust pockets being surrounded with a good body of water. The bore and stroke are, respectively, 4¼ and 5 inches, a combination which yields an A. L. A. M. formula rating of 36.1 horsepower. The valves are disposed on opposite sides of the cylinders and are actuated directly from below. Each piston is fitted with three composite rings, each consisting of a broad basic ring, outside of which are two narrow thin rings broken at opposite sides and set quartering the break in the large ring. The latter furnishes the pressure to expand the others while they are sufficiently flexible to conform to the contour of the cylinder under all circumstances. The connecting rods are of I-beam section the wrist pin bearing being fitted with an adjustable bushing. The crank shaft is mounted on roller bearings and is machined from forged nickel steel stock, ground and polished.

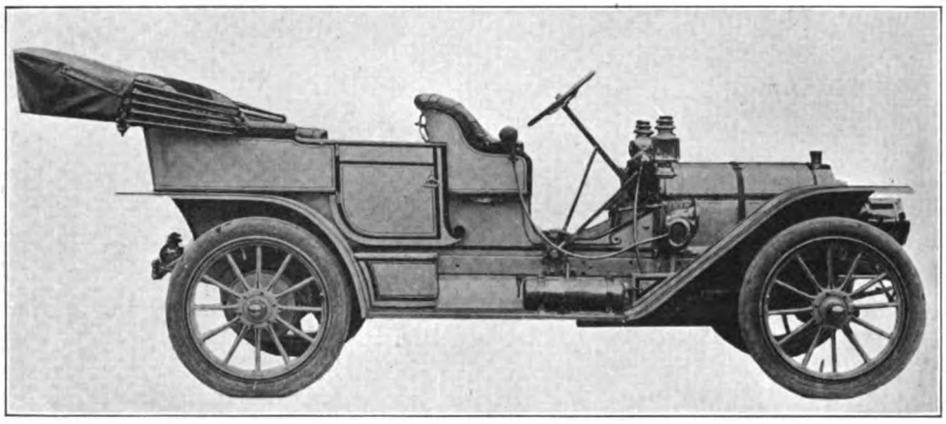
HAYNES TORQUE ROLLER

The crank case is built up in the form of a three-part aluminum casting, the upper section carrying the cylinders and supporting the motor by means of four integrally cast arms. A unique feature of the latter is that the two forward members are employed as housing and retaining reservoir respectively for the lubricator and oil supply. The right hand member, as shown by the accompanying illustrations, is cast in box shape and in it is carried the McCord oiler, which is gear driven from the crank case. The corresponding compartment on the opposite side is used for an oil retainer, and is connected with the lubricator by means of a cored passage leading to the pump. Five leads carry the oil to the respective cylinders and to the crank case, which is divided into four independent pits, to guard against the banking of the oil when the car is running over inclined roads. The half-time gears and the gear drives for the auxiliaries—oiler, water pump and magneto—are packed with grease in a separate compartment.

A complete and independent dual ignition system is employed. Two sets of spark plugs, carried over the inlet valves, are used, one set being fed with current from a high tension magneto, while the other is supplied from the ordinary battery and dash board coil arrangement, the timer for which is mounted at the top of a vertical shaft set midway between the two cylinder groups.

Several points of novelty are embodied in the arrangement and construction of the transmission system. The clutch is of the contracting band type, and is so contrived as to form what is practically a universal joint between the crank shaft and the line shaft of the transmission. The clutch drum, which is of bronze, is supported in the fly wheel by means of a four-arm cross, each of the cross ends being forked to engage lugs upon the fly wheel. Coiled springs are interposed between the lugs and the forks to cushion the driving action and thus relieve the gears from many of the sudden strains which they must otherwise receive. A heavy arm keyed to the clutch shaft sup-

Digitized by Google



ports the band, and the subjoined mechanism of engagement is so contrived that when disengaged, it is impossible for the band to drag.

Three forward speeds with direct high tension are afforded by the gearset, which is of the sliding gear, selective type. An original feature which has been employed in these cars for several years is the ratchet drive of the master gear on the counter shaft, whereby the latter is permitted to overrun the main shaft when changing from higher to lower gears, thus doing away with the danger of stripping the teeth. Both main and counter shafts are mounted on specially designed roller bearings, and are provided with stuffing boxes to prevent the lubricant from exuding from the case.

The final transmission from the driving shaft to the rear axle is through the "roller pinion" drive, which also is a distinctive Haynes feature, and which corresponds to the "pin and lantern" gear, familiar in old-time mill practice, except that the engaging members of the driving gear consist of rollers which secure a true rolling contact at the driving point. Another original feature of the rear axle group is the torsion resisting member which replaces the torque rod of common practice. As shown in the smaller illustration on the previous page, this consists of a short arm-like extension from the upper part of the differential housing, which carries a stout roller. The latter is engaged by the two faces of a vertical fork extending downward from a pair of cross-frame supports and braced in such a way as to resist any tendency on the part of the axle housing to turn. The provision of the roller, of course, permits the frame to move up and down on the springs without in the least affecting the position of the axle.

In the braking system, provision is made for the employment of water-cooling under stress by hard running, by the construction of the drums in closed form, and the application of the brakes upon the outside. The emergency and running or service brakes, are both of the contracting type. The shoes are of the two-part type, each part being supported at two points, so that there is no possible danger of dragging so long as the adjustment is correct. The emergency set employs a working face of 1½ inch width, while the service brakes are 1¼-inch face width. The drums upon which they are mounted are 14 inches in diameter.

Four types of body are mounted on the standard chassis, namely the touring equipment, which is here shown; the runabout, which is of conventional mold, but has its seat about 6 inches further back than that of the touring car, together with an optional rumble equipment seating one or two passengers according to the fancy of the owner; the "Hiker," which differs from the runabout mainly in having no rumble accommodations, and being arranged more on racing lines; and the toy tonneau. In this the front seat is placed in much the same position as in the runabout, but the rear seat is brought forward from the position given it in the ordinary touring car and also is narrower and accommodates but two passengers. The body is thus a sort of combination between the touring and runabout types, and satisfies the requirements of the light and handy tourist vehicle.

HAYNES MODEL X

Panhard Plans Two New Models.

In connection with the announcements of the foreign makers each year, great interest always is evinced in the Panhard models, particularly within the past two or three years when that historic mark has been graced with more novelty than ever before since its introduction. This season, it appears, is to be no exception to the rule, for the plans for the 1909 product which has just begun to be discussed includes not simply two new models of types rather out of the ordinary line—at least considering their origin, but also the use of a new system of transmission change gear which is planetary in principle.

Of the two new models, one, it is said, is to be a taximeter cab chassis, designed for the special purpose of competing with the Renault cabs, which are so widely used. The other is to be a six-cylinder light car of about 20 horsepower. The new change speed gear is the invention of Henroid, whose designs have always been inclined toward the radical, and is designed to be carried by and practically enclosed in the flywheel of the motor. Although it is familiar in type, it is said to be a new development of the planetary idea. It has been under experimental investigation at the factory for several months, and is mentioned as a probable feature of the 1909 line.

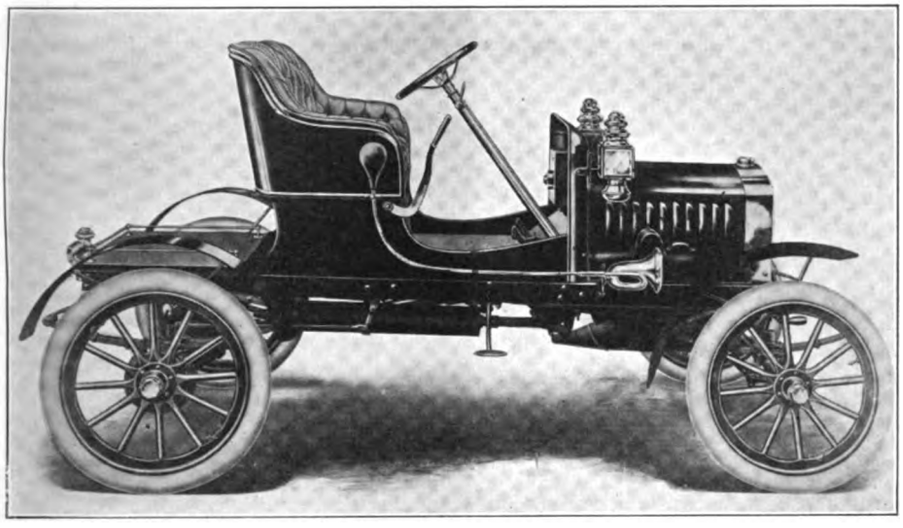
Why the Wire Rope Requires Watching.

Happily the use of wire rope as a means of connecting the emergency brakes with the actuating lever is passing out of popular use. At the same time on old cars or the newer machines which are still in use in which this construction is employed the dangers attendant upon its use are still encountered. In addition to the need of keeping the cable well lubricated in order to assist it in equalizing the strains on the brake bands, it is important that its condition be watched with extreme care, as the breaking of even a single strand of the wire may involve the clogging of the rope when in action, and invariably forestalls an ultimate breakdown. After the first strand breaks, the complete rupture follows with surprising suddenness. A disadvantage of the system which makes it all the more imperative that it be watched with great care is that the breakage of the cable disables not one, but both brakes.

About the Form of the Tank.

Although the careful driver may never reach a point where the last pint or so of gasolene in the tank is necessary to the running of the machine, still that is a contingency which arises with sufficient frequency for it to be worthy of consideration of the designer. For this, the special emergency compartment tanks serve a useful purpose. Considering the fact that at any time the car is liable to be driven over a sharp incline at the side of the road and tipped sufficiently to throw the wash away from the outlet it is surprising that so many makers still continue to equip their cars with plain open tanks having perfectly flat bottoms. The simplest method of avoiding difficulty from this source, namely, the use of tanks with inclined bottoms, is even less common than the use of the two-compartment tank.

Keeping the Spring Yokes Secure.



Whenever the car is being given a thorough overhauling the spring yokes should be gone over carefully and the nuts drawn up evenly and as tight as is possible without stripping the threads. Even in the case of springs which have been in use for a long time and have been drawn up in this way repeatedly a certain amount of settling takes place so that it is possible to move the nuts a fraction of a turn. Unless the springs are firmly held there is danger that the leaves will work out of place and be subjected to unequal strains through this displacement.

MAXWELL MODEL IN REDUCED SIZE

"Junior Standard American Runabout" Retains Characteristics of Its Big Sisters —Modest Price a Feature.

In introducing a new model similar in construction to one which has been exploited successfully in the past, but of larger size, the maker is put to the trouble not merely of developing a new quarter of the field, but also of proving satisfactorily that his design will stand enlargement. The reverse process, however, is attended with no such embarrassing features and the diminutive successor to a known proposition is almost certain of its reception by the public. On this safe principle the Maxwell-Briscoe Motor Co., Tarrytown, N. Y., makes announcement of a new achievement in the "Maxwell Junior Standard American Runabout.' Apart from its other characteristics the feature most calculated to draw attention to this little machine is its price, which is $500, fully equipped and ready to run. And, indeed, its specifications would appear to place it among the "sensations of the season."

MAXWELL JUNIOR STANDARD AMERICAN RUNABOUT

That it follows in every essential detail the well known characteristics of Maxwell construction is another point in its favor. It is thus quite on a par structurally with other members of the same lineage in that it has three-point suspension, unit mounting for the entire power plant, thermo-syphon circulation for the cooling system, multiple disc clutch and metal bodies.

In respect to its specifications the chief interest depends upon their dimensional value rather than the introduction of new or unexpected qualities. Thus the motor is of the horizontal-opposed pattern, its twin cylinders measuring 4 inches bore and stroke, and the rated output is 10 horsepower. The crank case and change gear housing is a one-piece aluminum casting. The cylinders, piston packing rings and time case cover are of cast iron—the latter being so constructed as to permit of removal without disturbing the adjustment of the timing. By means of a "hot-air" ring surrounding one of the cylinders the air supply for the carburetter is thoroughly warmed before entering the mixing chamber. The carburetter itself is of standard Maxwell design and offers the desirable feature of automatic compensation of the charge. Lubrication is by positive feed from a compression oiler mounted on the dash, and each cylinder receives an independent supply. Jump spark ignition is used, with the ordinary double coil and battery arrangements.

The transmission comprises the multiple disc clutch enclosed and running in oil, planetary change gear affording low and reverse speeds in addition to the direct high, and propeller shaft equipped with two universal joints and leading to the live rear axle. The change gear and clutch are mounted in the main housing of the power plant, and while rigidly connected with the engine, receive the full benefit of its three-point support. The universal joints of the shaft are lubricated by a special provision which reduces the attention required from the operator to a minimum.

Control is effected by means of the steering wheel, spark lever directly beneath it, foot actuated throttle and lever and pedal arrangements for the clutch, gears and brakes. The latter are double acting in principle and apply to the rear hubs.

The frame is of hot riveted pressed steel; the springs are full elliptical, both front and rear; the wheels are 28 inches diameter, shod with 3-inch clincher tires; the wheel base is 82 inches. The weight is listed at about 1,100 pounds. Tankage is provided sufficient for 100 miles of average running, the gasolene, oil and water capacities being respectively, 10 gallons, 1 quart and 2½ gallons.

The body which is of the pure runabout type with flat deck back of the seat, is made of metal with stamped moldings, divided seat and is sold equipped with ornamental deck rail in the rear. The equipment, which is included in the price, comprises dash and tail lamps, horn, tool and tire kits, and irons for a top may be had as an extra.

Five other models compose the remainder of the line. The Model "LD" is a light runabout of much the same proportions as the "Junior" model. It is more powerful, a little larger, more fully equipped, and therefore more luxurious. It is driven by a 12 horsepower motor, has 84-inch wheel base and 30-inch wheels, 3½-inch tires, and comes with this equipment: top, gas headlights and generator, oil side and tail lamps, the usual utensils and a magneto. As an option, it may be had with a special body of the rumble seat order, but minus the top.

Model "DA" is the four-cylinder, 24-30 horsepower machine which is already so well known in the markets. It is a light touring car, having 32 by 4-inch tires, 104-inch wheel base, and selling with an equipment into which the mageto is counted. Similar to it in general respects is Model "KA." which has a folding rear seat of the rumble order, and hence fulfills the requirements of a runabout.

A 20 horsepower motor of the double opposed pattern is employed in models "HD" and "Dr." The former of these is a light touring car running on 96-inch wheel base, and selling with a cape top in addition to its other equipment. The "Dr." model is designed and built with the evident intention of fulfilling the needs of the professional man who must be out in all weather, and so is provided with a top, and having ample power and wheel base, is well suited to the requirements of all-weather service.

How to "Convert" a Plain Nut.

It frequently happens that certain parts of the machine which have to be adjusted often are provided by the maker with plain nuts when wing nuts would serve to better advantage. In such cases the driver can readily "convert" a plain square or hexagonal nut by making a saw cut across it and soldering in place a couple of thin steel blades of appropriate shape. A simpler method is to drill a small hole through the long diameter of the nut, entering the drill at one of the corners, and driving a small pin into either side.

Muffling the Sound of a Noisy Gearset.

It is an easy matter to muffle the sound of a noisy gearset by stuffing the case with thick grease. Its absolute suppression, however, is only to be accomplished by the use of a new set of gears in place of those which are worn down sufficiently to give excessive play. Unlike other elements of the mechanism, the gears are not subject to adjustment for wear.

TO GUARD AGAINST GARAGE FIRES

Comprehensive Ordinance Proposed at Convention of Fire Chiefs—Rules for Location and Regulation.

Declaring gasolene to be "an enemy of life and property far more terrible than dynamite, guncotton or nitro-glycerine," J. A. Archibald, fire chief of Cincinnati, O., at a recent convention of chiefs of fire departments, proposed a complete set of garage regulations which are of interest as embodying the ideas and experience of a veteran fire-fighter who has made a special study of garage phenomena and the things that happen as a result of the peculiar qualities of gasolene vapor. Its greatest danger, he declared, lies in the fact that the unseen vapor "hunts its way into every crevice, driving out the air with its heavier weight and finally reaching its opposing force with that death dealing effect only too well known to the fireman."

After discussing some of the chemical and practical aspects of gasolene, Archibald offered his suggestions for rules for garage conduct and regulations for equipment that to his mind are calculated to protect alike the garage, its patrons, its neighbors, and the public. His recommendations take the form of a proposed ordinance, which in addition to the usual provisions, contains one or two suggestive and valuable ideas in this connection:

No garage should be carried on, except in a fireproof building, not more than three stories high. No garage should be maintained within the came square with hotels, theatres, school houses, hospitals, or other buildings designed for public purposes, nor in any building, of which any part is used as a dwelling. Heating should be done by steam or hot water; the boiler room to be fire proof, and all openings between it and other parts of the garage to be protected by double "standard" doors; no stoves, forges, torches, or furnaces, and no open-flame fire, except as provided in the fireproof boiler room. No lights, except electric, incandescent lights, properly inclosed in vapor tight globes, protected by approved wire-guards, should be allowed in any garage. All of these volatile substances should be stored in closed tanks. No storage or garage building should be placed, installed, constructed or maintained, until an application for permission to do so, with plans and specifications showing a full detail of location, construction and connections, shall have been filed with and approved by the city inspector of buildings.

No storage tanks should be placed, constructed or maintained under a public sidewalk or in a sidewalk area. All storage tanks should be constructed of steel and coated on the outside with tar or other rust-resisting material. The material of all tanks should be at least 3-16 inch thick. No tank should have a capacity in excess of 250 gallons, and all its joints must be tightly caulked. All pipes connected with the tank should be at the top thereof; all tanks should be so buried that no part of their top shall be less than 2 feet beneath the surface of the ground, at the point where the tank is located; all tanks should be completely cased, and surrounded with 12 inches of Portland cement, well tamped in place. All storage tanks should be provided with a vent pipe of 1 inch or large wrought iron or steel pipe, galvanized, with heavy cast iron fittings and screw-joints made with litharge and glycerine, and should be connected with the top of the tank. All tanks should be provided at the top with a screening of 30-mesh brass wire, with goose-neck attachments; all vent-pipes must be carried to the outer air, well braced in position and extended 2 feet above the roof of all buildings within a radius of 50 feet. It should be unlawful to carry more than 500 gallons of these substances on hand at any one time, and then only under the conditions above specified.

All tanks should be provided with a filling-pipe; the filling-pipe should be of 2-inch or larger steel pipe, galvanized, with heavy cast iron fittings and screw-joints made with litharge and glycerine, and no unions or flange connections should be permitted. The filling pipe should be provided with two screens of 30-mesh brass wire, placed, one at or near the tank-connection and one just below the filling cock or valve; the filling pipe should be closed at the intake by a filling cock or valve, the opening of which should be closed by a screw-tap, when not in use; the filling pipe should connect at the top and extend down to the bottom of the tank, and should be laid at a uniform grade, so that it will drain entirely into the tank; the intake-end of the filling pipe should not be within any building and should terminate in a covered box of heavy iron, which should be the level of the ground and kept locked when not in use.

Not more than 10 gallons of volatile inflammable liquid should be kept in vessels in a garage, and then only in approved safety cans constructed of metal, self-closing and of a capacity of not more than 5 gallons each. When not in use, these cans should be placed and kept in drip-cans, and, in garages maintaining a pump house, should be placed and kept in that. In lieu of the above described safety cans, portable filling-tanks of approved construction, not to exceed 50 gallons in capacity, may be used for transporting volatile inflammable liquids to and from the storage tanks for filling and charging the vehicles. The said portable tanks shall be supported on rubber hose attachment, not to exceed 8 feet in length, equipped at the end with shut-off valve with ground key.

All fire or lights on such vehicles or under their boilers should be extinguished upon the entry of the vehicles into the garage within 10 feet of the threshold, and should not be lighted while it is in the garage, until it is brought within 10 feet of the threshold of the exit. Movable incandescent lights in a garage should be protected by vapor tight globes, inclosed in approved metal guards, and should be fitted with keyless sockets, and all electric switches and cut-outs shall be permanently located at least 4 feet above the floor and in an approved cabinet. Where electric charging apparatus is installed or placed in a garage, it must be inclosed in the same manner as herein specified for the boiler room.

No person should smoke in the garage. . . . . The reason for such restriction is quite obvious. Therefore, a notice in large letters, to read, "No Smoking," should be kept displayed in a conspicuous place and manner on all floors and at the entrance of all garages.

No volatile inflammable liquid should be used in a garage for cleaning or for any other purpose whatsoever other than filling the tanks of such vehicles. No such liquids should be allowed to run upon the floor or to fall or pass into the drainage system of the garage; nor shall any such liquid be put into or removed from the tank of the vehicle, while any light or fire on the same is burning, and no such liquid should be carried or kept in open vessels in any garage in any city.

On the floor of every garage there should constantly be kept and maintained conveniently receptacles filled with sand, to be used in absorbing waste oils on the floors. In addition, sand should be kept on every floor in boxes or buckets of approved construction, provided with hand-scoops, to be used for fire extinguishing purposes only—one such box or bucket for 800 square feet of floor area or fraction thereof. Beds of sand, or metal drip pans filled with sand, should be placed under every such vehicle kept on the floors that are not fireproof. One 3-gallon carbonic acid gas fire extinguisher of approved construction should be provided and conveniently located for each 1,000 square feet of floor space, or fraction thereof. Self-closing metal cans, set firmly on 4-inch legs should be kept on the floors of every garage, into which all inflammable waste material should be deposited. Calcium carbide should be kept in airtight buckets at least 6 inches above the floor and in an airtight container provided with a securely fastened cover. If there is a boiler compartment, the container should be located within it.

Movement for International Registration.

In connection with the international conference which is being held in France this week for the purpose of drawing up regulations to facilitate international motor car travel, the plan of making car registrations and drivers' licenses valid in all countries will be advocated. The Touring Club of France submitted to the managing officials the following suggestion for the regulations:

"To accept as valid in France the permits or licenses or certificates granted by other countries both for the vehicle and for the driver. In countries where there are no such official papers, to accept as valid in France the certificates given to their members by the principal motoring clubs or associations. To institute a special registration number, to be known as the Customs number, and easily identifiable, to be fixed by the Customs on entry, and restored to the Customs on leaving."

Automobiles to Expedite Mail Collection.

Owing to geographical location, Indianapolis, Ind., has to close its outgoing mails very early, and heretofore the last collection from the streets boxes in certain parts of the city has been made about 6 p. m., much to the disgust of the people who dictate their letters at 5:59 or thereabouts. To placate the grumblers, the postmaster asked Washington for permission to use automobiles for later collections, a request which resulted in a Department expert coming to look into the matter. He has agreed with the postmaster that two or three motor cars would make it possible to collect until as late as 8:30 where heretofore it has been collected at 6 o'clock, and if satisfactory machines can be bought at a moderate price the Indianapolis post office will be allowed to make the purchase.

DEFECTS IN STEERING SYSTEMS

Sources of Danger to the Gear—Difficulties of Adjustment—Some of the Serious Causes of Trouble.

It is several years since designers and students of the problem of automobile construction in general came to consider themselves thoroughly familiar with the intricacies of the steering question. Yet though they may be fully understood, the fact remains that the usual type of steering gear still exhibits numerous faults, some of which are of so serious a nature as to merit consideration. Thus, although the common method of connecting the front wheels is supposed to give absolute rolling motion when the vehicle is traveling over turns, it does not always do so in actual practice. Further, while the method of inclining the front wheels is such that their points of contact coincide with the center lines of the steering pivots, it is a fact that many steering groups constantly tend to spread, that is to say, the wheels have a tendency to diverge. This tendency, of course, must be resisted by the connecting rod, and this ordinarily frail member is thus in constant tension or compression according to whether it lies in front of or behind the axle.

In a rather exhaustive treatment of the subject the London Autocar criticises the prevalent methods of steering at some length, incidentally pointing out a number of minor defects, several of which are capable of being remedied without serious difficulty. Indeed, several of the points emphasized are of such an important nature as to merit far more serious consideration than they ever have received.

The intense and rapidly repeated road shocks furnish the most important source of danger to the gear as well as the most difficult to guard against. In this connection the authority cited observes that "as every road shock tends to deflect the wheels, it is necessary to provide some mechanism which will resist such deflection without throwing the strain on the arm of the driver, and this is most easily accomplished by the use of the customary worm and sector gear.

"This gear is not really irreversible," continues the author, "though it is usually described as being so, and, as a matter of fact, if a really irreversible gear is fitted, the steering is very uncomfortable.

"It would be perhaps naturally anticipated that a truly irreversible mechanism which did not allow any motion to be transmitted from road wheels to hand wheel would absorb all shocks, and therefore be extremely comfortable, but, as a matter of fact, though the shocks are absorbed, the rigidity of the gear renders it impossible to 'feel' the road, and after turning a corner or swinging out to pass another vehicle the return to the straight course cannot be obtained by the same natural and easy motion possible with a gear that is not quite irreversible.

"But the worm and sector, though no doubt the best mechanism to use, is never made strong enough for the work it is called upon to perform. Owing to the vast majority of steering motions only taking place over a small portion of the total lock, any gear will wear more rapidly at the center of its motion than at the extremes, and therefore it is almost impossible to provide a positive adjustment which will take up wear at the center without making the gear stiff on the locks, yet knowing this, designers still continue to make gears of the same size and pattern year after year.

"Why should not the worm and sector be made double or treble the size that they usually are? There is plenty of room in most chassis for a very much larger steering box, and even if there were not it would be well worth while to alter the rest of the mechanism to permit of one being fitted.

"Every manufacturer must know that his cars will be steered improperly in garages and coach shops, and yet even in the light of this knowledge he does not design his gear to stand the ill-treatment it is certain to receive. Not only are gears never made strong enough, but they are very seldom made accurately. If a worm drive for a back axle was being produced the worms and worm wheels would be most carefully cut, ground, and hardened, but the steering gear which is continually absorbing shocks, even if it is not in constant motion, very rarely has correctly shaped teeth, let alone hardened or accurately fitting ones. The gear is more or less slack even when new. A worm gear will bind unless the teeth are correctly in mesh, and though a gear may move with perfect ease when there is no strain on it, as soon as any pressure is applied the gear will stick. Thus a gear which appears to be perfect when the wheels are jacked up, may be either always tight, always loose, or tight and loose in alternate positions when in actual use.

"The worm and nut or screw gear suffers from exactly the same defects, and possesses the additional disadvantage of requiring another joint to connect the nut itself with the steering lever.

" . . . . If the same care was taken over the machining and assembling of the gear as is taken over other parts, looseness or stiffness would never occur. Also it may be added, the worm should be properly supported and provided with adjustable thrust bearings. In quite a number of gears the only bearings are at the extreme ends of the steering column, and when this is the case the spring in the tube of which the column is made will allow the worm to spring partly out of mesh with the sector, and when there is no adjustment to the thrust, as soon as a little wear has taken place not only will there be lost motion, but the worm will be able to move up and down slightly, causing rattling in the box accompanied by snatching at the wheel.

"Even assuming that the gear itself is incapable of improvement, there still remain quite a number of details which are usually so badly designed as to be absolutely dangerous. Firstly, the joint pins of the tie rod are seldom large enough, also the forks at the ends of the rod are frequently weak, and it is only in very rare instances that any adjustment or proper means of lubrication are provided. Even though the actual motion about these pins is small, there is a continuous strain the whole time the car is running, which strain varies as the road shocks vary, and the constant blows on the pins are equivalent to quite a considerable amount of motion. It is hardly necessary to describe the methods by which these points can be improved; it is simply a question of spending a little extra money in the first instance, but the amount is so small by comparison with the total cost of the car and the importance of the parts is so vital, that the wonder is manufacturers can afford to neglect them. . . . .

"The advantages of the ball joint in comparison with the pin universal which was employed on the old Wolseley cars is that it is easy to make it so that the wear is automatically taken up by springs. The ball should most emphatically always be fitted on top of the stub axle and at the side of the steering lever, so that the steering rod will not easily drop off if the ball becomes loose in the cups. . . . .

"All the minor faults of steering mechanism, such as wandering of the road wheels without movement of the hand wheel, spring in the connection, backlash, and consequent snatching at the wheel, are due simply and solely to the designers not realizing the immense strains to which every portion of the gear is subjected. Unfortunately, the weakness is not confined to the joints alone; the usual tubular connecting rods are none too strong, and breakage of the stub axle arm sometimes occurs, particularly where it is made to carry both the connecting rod and tie rod. Where springs are employed they are seldom of sufficient strength; tie rods, connecting rods, levers, and the worm gear itself, each and all have a heavy load to carry, and they are rarely strong enough to carry it without a considerable amount of springing and bending, rendering the steering uncertain in action and very uncomfortable when running fast over rough surfaces.

"The trouble does not altogether lie in the design, for, as has already been mentioned, bad workmanship is frequently met with even on quite good cars. A typical example of careless fitting is the frequency with which cars will lock over further on one side than on the other; the stop which limits the motion may occur at any part of the gear, but it is usually in the worm box, and it is only necessary to set the sector properly to obtain equal lock. Also

Digitized by Google

if the steering lever is not vertical and if the stub axle arm is not at right angles to the connecting rod when the road wheels are in their middle or straight position, a definite motion of the steering wheel will give a different degree of lock, according to the direction in which it is made.

"Another frequently observed effect is what is best described for want of a better term as flapping of the front wheels. With almost every car there is a particular speed at which this action will be most pronounced. . . . . It is partly caused by spring in the connections, but is also due to an entirely different action. As the rear springs give to a bump, the frame approaches nearer to the axle, and as it recovers its original position the ball end of the steering lever will move up and down in a vertical line. The ball end of the stub axle arm cannot move similarly, and so it is forced to move to and fro, and the wheels must, of course, move likewise, so that when a continual bouncing is going on the wheels will flap.

"The shorter the connecting rod the more pronounced will this action become, and it need scarcely be added that such flapping tends to make the steering erratic. The fashionable large rake to the steering column necessitates a short connecting rod, and thus flapping is usually worse on new cars than on those of older pattern."

Look at the Gear Lever Before Cranking.

Frequent accidents in which a car runs away when the starting crank is turned emphasize the importance of always looking to see that the gear lever is in neutral position before attempting to start the motor. While it rarely if ever happens that a car is left by the driver with the gears engaged, the levers are sometimes manipulated and moved by others and are left by them in such a position that the starting of the motor means the starting of car also, an experience which generally results in the man at the starting crank being run over or jammed against the garage wall when he begins operations.

Loose Cams a Source of Noise.

An obscure and totally unexpected cause for irregular and noisy running in a motor which otherwise appears to be in good condition, is a loose cam. This difficulty, of course, only occurs in machines in which the cams are made independent of the shaft and pinned in place. Where this is the case it sometimes happens that a worn key or a loosened taper pin may occasion considerable difficulty of the sort indicated.

Care in Resetting Timing Gear.

When resetting the timing gear of a motor, it is well to make sure that the two-to-one gears are tightly keyed in place on their respective shafts. Otherwise there is liability of more or less uncertain action, not to mention the probability of a clatter in the valve gear.

ECONOMY IN MOTOR BUS GARAGES

Consular Report Describes Model Establishments in England—Suggestions About Use of Fuel and Oil.

Out of the fullness of British experience in the handling of motor omnibuses, American Consul J. Perry Worden, of Bristol, has prepared an extensive report dealing with the costs and administration of such promising undertakings. While much of the matter treated is already common knowledge in this country those portions which deal with the housing and care of the vehicles are of interest as indicating how the objects of economy and prompt service may be served to the best advantage, as much by the convenient arrangement and equipment of the garages as by careful use of supplies.

"A careful study of several of the best motor-bus garages in this part of the country leads to the conviction that if one would lay out a model garage it might be on a scale where the vehicles are placed ten abreast in rows of two, with sufficient yard space to enable them to turn in and out of the shed," says Consul Worden. "The effect of this arrangement is to reduce the movement of the vehicles to a minimum, since, at the most, but one vehicle has to be moved to get any other bus out of the shed.

"Most good motor bus workshops in England are situated near, if not next to, the office and near the entrance to the garage, and are equipped, of course, with suitable outfits and tools to enable the repairs to be carried out cheaply and expeditiously. There are lathes, small drilling machines, shaping machines, grinders, blacksmiths' forges, and wheel presses for re-tiring. Pits are provided in the shed, under the four vehicles next to the workshop, for facility in repairing and overhauling, and also under the third and fourth rows for the purpose of reblocking the brakes, etc., of the service vehicles in case all the other pits are occupied by vehicles under repair.

"At the end of most sheds is left a space that can be partitioned off and walled in, where bodies of the vehicles can be repainted and revarnished. Near the gate to the shed, perhaps on the left side coming in, will be found the best place for the petrol and filling tanks isolated from the main building. The carbide store is usually just beyond the petrol store, and here, and here only, if one would be cautious, all generators should be recharged. . . . .

"As the petrol bill on motor vehicles is one of the principal items of the running cost, every means should be adopted for studying and obtaining economy in consumption. One essential feature is to know the amount of petrol consumed by each vehicle, and means should be provided to this end. A petroleum-storage tank may be connected through a small semi-rotary pump to a smaller tank provided with a gauge glass, which is carefully calibrated in gallons. This small tank, which will hold about 40 to 50 gallons, is placed at such a height that the petrol will flow into the tanks of the vehicles by gravitation.

"Notwithstanding the fact that the consumption of petrol is a matter of vital interest, and that various and many carburetters, auxiliary air valves, etc., have been tried, nothing seems to have made the marked improvement for which many directors of garages are waiting and anxiously looking. One or two controllers are pronounced helpful, but there still appears to be scope for ingenuity in carburetters, especially if it be true that there is a possibility of a petroleum famine.

"This use of petroleum suggests the considerable use of lubricating oil, and reminds one that the most of oil used in motor engines is absolutely wasted. Of course some engines are far more wasteful than others, but careful supervision, coupled with the longer experience of drivers, should have, and in fact already has had, the effect of greatly reducing the amount used. The personal tendency of engineers in Bristol and vicinity is to use the cheaper oil, and in many instances they have found it to have answered equally well, but, for any great economy, the driver is the man who is to be looked after. Apart from the monetary consideration, over-lubrication is detrimental to the running of the engine, by oil getting on to the brakes, and also over the road. On some of the latest chassis models automatic lubrication has been introduced.

"Once the American capitalist, desirous of embarking on the motor bus enterprise, decides on the method of propulsion and the arrangement of the garage, he will do well to think of the average service of both vehicles and men. One of the most important questions that is to be decided first is the average proportion of the vehicles advisable to keep on the roads in everyday service.

"Experts seem to favor in a garage of 20 buses, as a maximum, the average use of but 13 buses a day, 7 days running, of an average of 90 miles per day, and to believe that this is the greatest number that can be kept on the road consistent with efficiency, where a regular service has to be run daily. This number would, therefore, allow two or three buses to be kept in readiness for changing over and for special service while the remaining five would be going through the hands of the day repair staff.

"With motor vans for freight, it is probable that the average percentage can be increased, but even in this case experience suggests that it would be a mistake to try and attain a very high percentage. Motor vehicles must have great attention paid to them at the hands of thoroughly efficient men, and unless this is done expensive breakages will occur which otherwise might have been prevented."

LEGAL LOCKING OF IDLE CARS

Providence Police Raise Important Point Under Rhode Island Law—City Solicitor Makes the Matter Plain.

In launching upon a crusade for the strict enforcement of the automobile law, the police of Providence have come upon a stipulation that all cars must be provided with a locking device for use when the car is left by itself on the street. The paragraph in the statute reads: "Every motor vehicle must be provided with some device to prevent said vehicle from being set in motion and no such vehicle unattended shall stand or remain in any public place without first being made fast or locked." As the question was a new one to the police, particularly as to what constitutes a lock under the meaning of the law, the question was submitted by the board of police commissioners to the city solicitor.

An opinion written by Assistant City Solicitor Henry Cram explains exactly what is meant by the statute and what steps automobilists must take to comply with the law. In the course of his opinion, Cram says: "The paragraph referred to was a re-enactment of Section 6 of Chapter 1157 of the Public Laws passed in 1904. The intent of said act at the time of its passage in 1904 in my opinion was inasmuch as all electric automobiles and practically all gasolene automobiles could be locked by the removal of a plug, so-called, from the spark coil, and the engine of the vehicle could not be set in motion without the insertion of such a plug, that such a removal was a sufficient locking device.

"Since that time, however, a large number of automobiles operated by gasolene have what is known as a magneto in place of the spark coil, and the movement of the magneto is controlled by a switch and not by a plug as in the other cases. The engine may be stopped or started by moving the switch of the magneto and therefore in the case of cars using the magneto it would be necessary, in order to securely lock such car, to have some device to prevent the moving of the switch controlling said magneto.

"Your further question, will the setting of the emergency brake disconnecting the clutch from the engine, be considered a sufficient locking device provided some attachment is placed on the brake that will prevent such brake from being changed until after such attachment has been removed? I answer in the affirmative. If all the conditions of your question are complied with, certainly the car would be securely locked."

Cops Ordered to Forego Joy Riding.

In return for free automobile rides for themselves and their friends, several of New York City's bicycle policemen have been unduly lenient with a number of motorists, according to accusations which brought them on the carpet before Deputy Police Commissioner Bugher recently. Calling the members of the cycle squad into his office, Bugher told them he knew that many of them were getting petty graft in various forms, the most common of which, he declared, was the free use of automobiles on their day off. He quoted statistics of arrest to show that the mounted police and officers on foot were catching more automobile speeders than they were, whereas motorists were supposed to be their special charge. Many owners of cars, he said, were permitted to go at any speed they liked, through the streets and the parks, because they had fixed things up in a friendly way with the bicycle squad, while unfortunate drivers from out of town were promptly nabbed for speed proclivities.

Chicago Enforcing Wheel Tax Law.

If in looking out of her boudoir window the wife of an automobile owner in Chicago sees a uniformed policeman come to the door she will not necessarily feel called upon to faint in anticipation of dreadful news. In all likelihood it is simply a call to notify her husband, by means of a printed slip, that he has not paid his "wheel tax" on his motor car and that unless he fixes matters up pretty quickly with the city collector his case will be put in the hands of the prosecutor. The disparity between the number of Chicago automobiles registered for state licenses and the number on which the local tax has been paid has led the city to send the blue-coats to the houses of the delinquents as an earnest of its serious intentions in making the forgetful ones "contribute."

Three attempts on the part of Chicago automobilists to knock out the "wheel tax" which the city is collecting on motor cars have proved unsuccessful, the last defect having been incurred in the Circuit Court when Judge Honore decided against the plea for an injunction brought by the Chicago Motor Club. Attorneys for the club, however, have appealed the case, so that the fight against this form of shakedown is not yet over.

Canada Makes Concession to Buffalo.

Proximity to the Canadian border has in the past brought Buffalo motorists up against the bond requirement when automobiles come within the Canada lines. An arrangement has now been effected by the Automobile Club of Buffalo, by which it is only necessary for its members to show their membership cards in order to go over the Niagara frontier, without the putting up of a bond. Negotiations with S. W. McMichael, chief of the Canadian customs, brought about this happy result, the club taking all responsibility for any abuses of the privilege. It will, however, be necessary for the Buffalonians to take out Ontario licenses if they intend driving in the province.

FOR MOTOR TRAVEL IN NORWAY

American Consul Makes Suggestions on Starting Automobile Stage Lines There —Two Recently Put in Operation.

How local agents in the unpromising territory of Norway are striving to introduce and popularize the automobile by the establishment of regular stage lines, is told by American Consul B. M. Rasmusen, of Stavenger, who reports that the use of machines in his district has been very limited up to this time, though present indications point to greater activity in the near future. The requirement of improved transportation facilities for the inland regions is recognized, he states, and it is probable that the better traveled routes will soon be covered by automobile lines.

"The plan that is being pursued at present," he says, "is to organize an omnibus-automobile company, with permission to carry passengers and freight, according to a time schedule, over certain routes, the organization being promoted by some one who either has an agency already or contemplates securing one, and who is thus assured of making a sale when arrangements have been completed.

"There are two automobile routes, recently organized, operating between Stavanger and adjacent points. The machines used are of European manufacture and were purchased according to the plan described above. From reliable sources it has been ascertained that several automobile routes are now under consideration in different parts of this district.

"Firms contemplating entering this market," he adds, "would do well to have experienced representatives on the ground to study the wants and investigate the conditions pertaining to the trade. The field is new and the prize is likely to go to those who enter first with intention to win."

Big "D" for Diplomats in Massachusetts.

A big "D" on a Massachusetts registry tag next year will mean that the owner of the car is a "diplomat," or representative of a foreign country. The shore of the Bay State is so popular with the diplomatic set from Washington in the summer months that special provision had to be made for them, the Federal Government having long ago taken the position that official representatives from foreign countries are not subject to local law. Constables throughout the state will be instructed on this feature of international intercourse and the big "D" will give immunity from arrest. Dealers in the state will have a figure "O" before the number on their tags, and the coloring of the tags for 1909 will be a reversal from this year's blue letters on a white background to white letters on a blue background.

The Week's Patents.

892,868. Clutch. Thomas G. Morse, Erie, Pa., assignor to Morse Iron Works, Erie, Pa., a Corporation of Pennsylvania. Filed Sept. 28, 1907. Serial No. 394,987.

1. The combination in a clutch, of a loosely journaled overhanging rim clutch member, radially movable jaws adapted to engage the inside of said rim mounted on the other clutch member, a rotatable sleeve, projections thereon adapted to move the jaws outward against said rim, and electrically actuated mechanism for rotating said sleeve, substantially as set forth.

892,948. Shield for Tires. Richard H. Faughnder, Sidney, Ohio, assignor of one-fourth to Charles Pearson and one-fourth to George Bustetter, Sidney, Ohio. Filed March 2, 1908. Serial No. 418,904.

1. A tire cover comprising a series of metallic plates overlapping each other at one end, a chain encircling the outer surface of said plates, said plates being pivotally connected to the links of the chain, and means for securing the plate to the rim, substantially as described.

893,032. Worm Gearing. Ernest E. Sweet, Detroit, Mich., assignor to Cadillac Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Jan. 11, 1908. Serial No. 410,439.

1. In a gearing, co-operating intermeshing members constructed to provide a slight clearance between the intermeshing portions thereof when moved from the normal position, while being in full engagement at the normal position.

893,038. Air Pump for Inflating Pneumatic Tires. Octave Vadam, Paris, France. Filed Jan. 15, 1907. Serial No. 352,414.

The combination in an air-pump of a plurality of pairs of oppositely placed cylinders, pistons and rods for the cylinders, a central operating shaft around which the cylinders are arranged symmetrically, an actuating cam on the shaft, common base plates for the cylinders at each end of the pump, said base plates having ports and channels adapted for conducting the discharge of all the cylinders to a common outlet, rods connecting the base plates at opposite ends adjustably and holding the cylinder, piston rods and cams in operative relation, a pipe connecting the air channels in the base plates, ball bearings for the shaft, said shaft projecting through a base plate and having operating means attached to the projecting end of the shaft, substantially as described.

893,075. Wheel. Ernest Hopkinson, East Orange, N. J. Filed Oct. 16, 1906. Serial No. 339,172.

1. A wheel rim having a clencher hook at one side, a removable flange on the other side, and a removable filler for the clencher hook having a substantially flat surface on its tire side.

893,107. Automobile. Charles Snow, San Francisco, Cal. Filed April 8, 1907. Serial No. 366,934.

1. An automobile comprising a frame, wheel axles, and front and rear fifth wheels supporting said frame upon said axles, each fifth wheel being open in the center and comprising an upper ring and a lower ring turning thereunder, the opposing faces of said rings being grooved to form a runway, balls in said runway, and means for holding said rings together against vertical motion, said means comprising U-clamps secured to one of said rings at suitable intervals, shafts carried at their ends, and a roller on each shaft rolling against the other ring, substantially as described.

893,144. Variable Speed Power Transmission Mechanism. Herman Casler, Canastota, N. Y. Filed April 24, 1907. Serial No. 369,998.

1. The combination of a driving shaft, a driving element on said shaft, an axially adjustable driven element rotatable on the said shaft, means for rotating the said driven element directly from the said driving element, a transmission element at an angle to the said driving and driven elements and constructed to drive the latter from the former, and means for axially adjusting the said driven element on the said shaft.

893,241. Force Feed Lubricator. Clarence B. Hodges, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a Corporation of Michigan. Filed Feb. 11, 1907. Serial No. 350,004.

1. The combination with a reservoir of a pumping device, two inlet and two discharge conduits therefrom, one discharge conduit leading to a sight feed or bleed and back to the reservoir, the other discharge leading to the point to be lubricated, and a single regulating device for regulating the amount pumped through both discharge conduits.

893,270. Vehicle Wheel. Uzziel P. Smith, Akron, Ohio. Filed Sept. 19, 1906. Serial No. 335,177.

1. A wheel comprising a hub section and a rim section, a cushion between said sections adapted to receive the shock of relative movement between the two, a driving connection between said hub section and rim section comprising a disc revolubly mounted on a hub section and eccentrically connected with a disc revolubly mounted on the rim section.

893,281. Universal Joint. Benjamin F. Teal, Glenside, Pa. Filed Feb. 21, 1907, Serial No. 358,679. Renewed Dec. 16, 1907. Serial No. 406,771.

1. A universal joint comprising a yoke, an element, an oscillatory member interposed between the yoke and element, adjustable trunnions carried by said element and oscillatory member for engagement with the corresponding trunnions, and antifriction balls arranged between said trunnions and race members.

893,323. Explosive Engine. Charles R. Greuter, Wilkes-Barre, Pa. Filed April 25, 1907. Serial No. 370,277.

1. In a valve mounting for explosive engines, a cylinder head having a water jacket, a valve cage having a threaded neck and a contiguous shoulder forming a detachable ground joint connection with the inner wall section, and a locked connection with the outer wall section, said valve cage being exposed to the water in the water jacket.

893,400. Internal Combustion Engine. John A. Torrens, Coleraine, Ireland. Filed May 15, 1908. Serial No. 433,121.

1. In internal combustion engines, in combination, an engine cylinder having a main valve chest at one side thereof and communicating therewith, a valve box detachably secured to said chest and having inlet and exhaust chambers communicating with said chest, a main valve controlling communication between said chest and the engine cylinder, inlet and exhaust valves controlling the communication between said chest and said valve box means acting to hold said several valves normally seated and means for positively operating said main valve.

WANTS AND FOR SALE

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets of the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

893,409. Power Transmission, John L. Williams, Ellzey, Fla. Filed Aug. 31, 1907. Serial No. 390,951.

1. A power transmission for vehicles, comprising the vehicle wheel provided with a hub having internally arranged teeth, an axle, a stub axle pivoted to the end of the axle and on which the wheel is journaled, a driving shaft in the axle, a stub shaft connected by universal joint with the end of the driving shaft, the free end of said stub shaft being polygonal in cross section, a sleeve fitting on the end of the stub shaft, pawls provided with pivot pins journaled in the sleeve, a shifting arm in connection with the pivot of each pawl, a shifting ring encircling the sleeve, and provided with springs for engaging the shifting arm at different points whereby to reverse the engagement of the pawl with the teeth of the hub, a stop pin for limiting the motion of the ring, a shifting lever provided with a slot, a pin on the ring for engaging the slot, a ring pivoted with projections connected with the stub axle, and springs for limiting the motion of the said shifting lever.

893,418. Gas Mixer. Amos L. Avery, Bradford, Pa. Filed Jan. 16, 1906. Serial No. 296,336.

1. A device of the character described, comprising an elongated tubular chamber having at its outer end a broad contracted portion forming a reduced ground opening, a stem of the same diameter throughout its length except at the center, which is provided with threads of greater diameter, the outer end of the stem passing through said ground opening and at all times forming a tight joint therewith, the outer periphery of the stem adjacent its outer end provided with a series of narrow elongated grooves gradually tapering in width and depth towards the outer end to a needle opening, said grooves being spaced a distance from the end of the stem to form a solid portion to form a tight joint with the ground opening, and means for moving said stem longitudinally within the tubular chamber.

893,455. Hydraulic Clutch. Augustus C. F. Dann, Southsea, England. Filed Aug. 3, 1907. Serial No. 387,000.

1. In an apparatus of the character herein referred to in which the driving and driven members inclose a fluid filled annulus, a block mounted on one of the members and adapted to slide thereon and to be projected to a varying extent into said annulus, a yielding stop on the second member projecting into said annulus and into the path of the block and means for operating said block from outside the apparatus; substantially as described.

893,498. Motor Attachment for Vehicles. John C. Higdon, St. Louis, Mo. Filed Nov. 21, 1905. Serial No. 288,496.

1. The combination with a vehicle body and running gear of a frame applied to the under side of the vehicle body, a support projecting laterally from one side of the frame, and an air-cooled hydrocarbon motor held by the support in such a position that there is a free air space between the side of the vehicle body and said motor.

ONE—TWO—THREE

In the recent Twenty-four Hour Race at Brighton Beach the winning Simplex—as well as the Lozier, which finished second—and the Thomas No. 3, were all equipped with

BOSCH MAGNETO

both the Simplex and the Lozier breaking the existing worlds' records. Whenever perfect ignition is desired Bosch Magneto is used.

The Mercedes, winner of the Grand Prix—the Pierce, Glidden and Hower Trophy winners—the Thomas Flyer, winner of the New York to Paris Race—the first ten cars in the Prince Henry Contest—the Fiat, winner of the Floria Cup (Italy) and the Lozier, winner of the first Twenty-four Hour Brighton Beach Race—and in fact the winner of every other racing and touring event of any importance in this country or abroad, has been fitted with Bosch Magneto.

Bosch Magneto Co.
160 W. 56th St., New York
Chicago Branch, 1253 Michigan Ave.

WHY DO—

the manufacturers of the following cars equip with

SOLAR LAMPS

Apperson	Kissel	Pierce
Autocar	Lozier	Rambler
American	Marmon	Stoddard-Dayton
Corbin	Packard	Stearns
Chalmers-Detroit	Peerless	Thomas
	Pope-Hartford	White

Because they recognize these lamps as more efficient, more durable—and in fact, a better product from any point of view than any other motor lamp on the market.

KENOSHA, WIS.

STEVENS-DURYEA

New Model X Limousines

A town car of the most luxurious type. Every detail suggests elegance and refinement. Among the points that contribute to its beauty of design may be mentioned the rounded back and extension front with bent glass windows, a combination giving those symmetrical lines lacking in Limousines not having these features. The luxurious upholstering and interior conveniences leave nothing to be desired in the way of comfort. A dome electric light with switch affords an instant and brilliant light, toilet cases with accessories are at each side, and a speaking tube connects with the driver. Seating capacity of body: five passengers.

PRICE COMPLETE, $3,750.

Warner Auto-Meter

GUARANTEED FOR ONE YEAR.

"Thirty Days' Free Trial"

When a manufacturer is willing to send his product to anyone, anywhere, for 30 days—with no deposit, no agreement to buy, no promise to do anything except give that product a fair trial—he must have more than ordinary confidence in his article. In order for him to have that confidence he must have a most extraordinary product.

That's what we do. We'll send an Auto-Meter to any automobile owner in the country—with no deposit, no agreement, no promise to do anything but put it on his car and give it a fair trial. It doesn't matter whether he has another make of speed indicator already on the car or not. Indeed, for the sake of comparison, we hope he has. We will abide by the decision—for he will always keep the indicator that tells the truth. We claim for the Auto-Meter that it is the only one of which "the dial never lies." We believe that the instrument itself is the most eloquent salesman we have—we're willing to let it do our talking. Send to-day—just tell us what make and model of car you have—size of tires, etc.—and we will send you an Auto-Meter.

Mongrel or Thoroughbred?

NOW IS THE TIME for you, Mr. Thoughtful Dealer, to decide what you will sell in 1909.

WILL IT BE A MONGREL? a car assembled from parts carried together from all over the country and hammered into shape as well as may be?

OR WILL YOU SELL THE THOROUGHBRED—a homogeneous mechanical masterpiece, every single part of which is the result of the same genius that devised the whole?

"ASTOUNDING," "MARVELOUS," "WONDERFUL," are the terms with which some assembled cars are now tagged, though they are astounding, marvelous and wonderful only to the assemblers, who like Rip Van Winkle, have been dozing in the growing woods of automobiledom and who now, bewildered by the progress that has been going on, seize upon time-tried and long-established practices and herald their adoption by the assemblers as brand-new discoveries.

LET'S REASON IT OUT: On the one hand you have the assembled car, with an engine bought from one manufacturer, a frame from another, and a transmission from a third, and so on down to the last rivet. The maker of the engine, the mill in which the frames are pressed, the transmission man, all derive their separate profits, leaving no other way to the assemblers to obtain their rewards than by skimping the quality of their "product."

AND THEY DO IT—THEY MUST! When you examine some of these astounding cars you will be truly astounded on finding that the four-cylinder engine is cast in one piece and has only two main bearings, whereas the Maxwell has four cylinders and five main bearings. You know well enough that making a motor with only two bearings is equal to leaving the engine to its own devices as far as alignment is concerned.

IT WILL BE A TOUGH JOB FOR THE DEALER to convince the purchaser who is wise that some four-cylinder engines of small dimensions will develop as high as 30 horsepower—because they can't.

MAXWELLS ARE A HOME-GROWN AMERICAN PRODUCT. The use of Maxwell features in Maxwell cars was neither a heaven-given inspiration nor the aping of foreign design, but the outcome of sound engineering sense.

WHEN 10,116 MAXWELL OWNERS testify to the excellence of their cars, all of which have been sold by Maxwell dealers, then the Maxwell proposition is one that you can't afford to pass by.

BEFORE HITCHING YOUR WAGON TO A STAR it will be wise for you to find out all about a dealership for Maxwells, the success of which is past and present, instead of lying in the dark and distant future that has swallowed so many wonderful cars that have been marvelous chiefly in their complete and rapid disappearance from the field of legitimate competition.

Matheson

1909

Prices Redneed $1,000

And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for **the best.**

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still **maintain the unequalled quality** of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by **doubling the factory output** and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital **has been increased by** $250,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, **at the makers' former prices to the agent or dealer;** namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5 500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

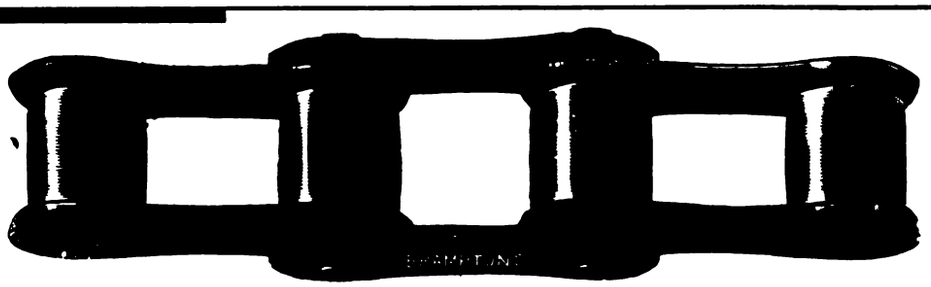
Morgan & Wright Tires

ARE UNIFORMLY GOOD TIRES



Barring accidents or exceptionally severe usage, you will get the same long trouble-less service out of every tire you buy.

No special tires.

You can be sure that the tire you buy is the best tire we know how to make.

MORGAN & WRIGHT, DETROIT

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. THE BRAMPTON CHAIN is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMPTON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

FRANKLIN 1909
Model D

The Perfect Score Car of the Chicago 1000-Mile Test, the Bretton Woods Eight Day Grind and the 1700-Mile Glidden Tour.

Unincumbered Franklin dash-board. Notice the neat effect. No coil box. No oiler. Merely the magneto switch. The needle valve stem and primer rod.

Ideal Ignition and a Clean Dash.

The Bosch high tension magneto as used on Franklin automobiles without an auxiliary battery system has solved the ignition problem.

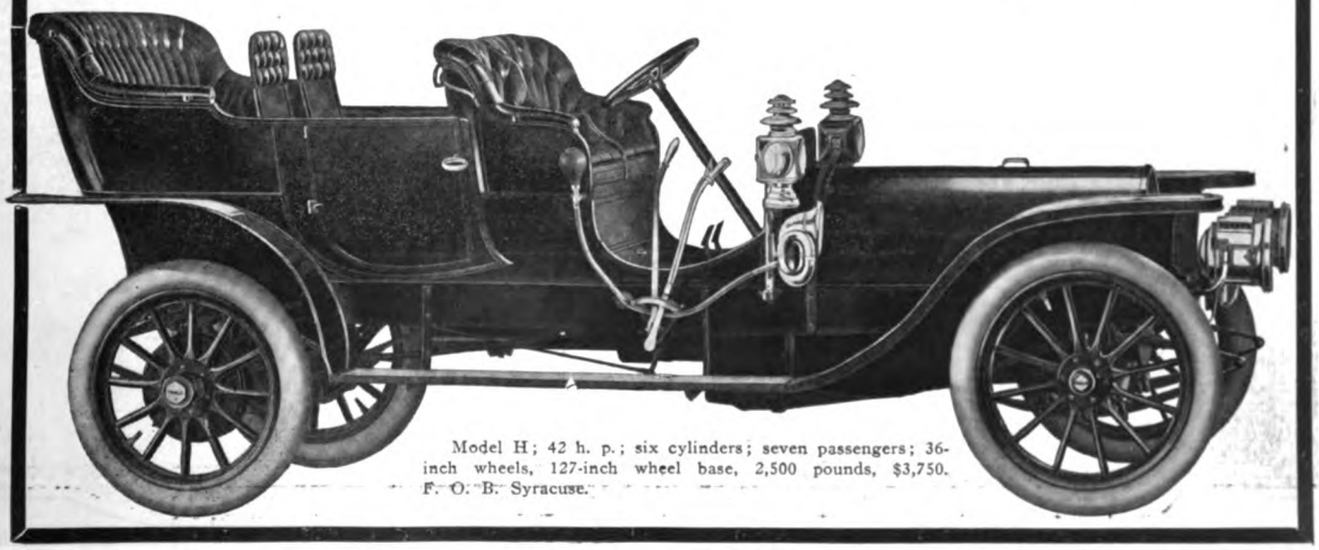
It is easier to crank the motor than with the battery system and back kicks are impossible. The magneto on Models D and H is provided with a governor which automatically retards the spark and holds it near dead center of the engine when starting.

With the magneto, slower running on high gear is possible than with the battery system without too much throttling of the charge. The spark can also be independently controlled by the control lever on steering wheel.

The spark is more intense than that of a battery and starts the motor easier at any time, particularly in cold weather when the mixture is likely to be poor at starting.

Records of the Paris, London and New York taxicab service definitely proves this to be the most reliable of all ignition systems.

In the Glidden Tour, Franklin automobiles equipped with this system had no ignition troubles whatever, not even a spark-plug was removed during the entire run.



The magneto gets rid of the battery box from the running-board and the coil box from the dash, thus adding to the neat appearance and general style of the automobile.

The Franklin is the first automobile in America to employ the high tension single ignition magneto system (nine-tenths of the leading foreign makers are already using it) just as the Franklin was first with air-cooling, first with four cylinders and six cylinders, first to put the force-feed oiler under the hood, and first with many good things.

Franklins are free not only from ignition troubles but they have no heating nor freezing troubles such as water-cooled automobiles are liable to. And because of their light weight and large wheels and tires, Franklins are free from the tire nuisance that makes every heavy automobile such a troublesome and expensive luxury.

Write for the catalogue describing Franklin refinements in detail, and the full line of Franklin touring-cars, runabouts and closed-cars.

H. H. FRANKLIN MANUFACTURING CO., Syracuse, N. Y.

Model H; 42 h. p.; six cylinders; seven passengers; 36-inch wheels, 127-inch wheel base, 2,500 pounds, $3,750. F. O. B. Syracuse.

More Remy Magnetos Sold for 1909 Cars Than All Others Combined

FIFTEEN THOUSAND Remy High Tension Magnetos have already been sold for 1909 cars.

—More than the total number of magnetos sold by all our competitors combined.

—More than all our competitors combined **can sell** for 1909 cars.

And **that's** not all. More Remy Magnetos **are now in use** on American-built cars than all others combined.

What does this mean? Simply that the Remy is the **tried** Magneto—the **known** Magneto—the Magneto that can be **relied on** for the best results with the least attention. The history of a magneto proves more than mere claims.

The Remy is the product of the longest experience in magneto construction. We are the oldest magneto manufacturers in the country. Remy Magnetos were in use and were known **before** the day of the automobile, proving the efficiency and certainty of its construction in motors, gasolene tractors, etc.

The Remy Magneto is used with the six-cylinder 200 h. p. steel clad gasolene electric cars of the Union Pacific, manufactured by the McKeen Motor Car Co.—with the powerful engines that operate the heavy Gerling gang plows in the West—and on many other big motors that depend on the perfection of firing for their famous efficiency.

All our experience and the latest light on the science of magneto building have been concentrated on the improvement of the Remy from year to year. The Remy for instance is the magneto without brushes. No brushes to cause trouble—to wear out—and to be replaced.

It is the **simplest**—the most **compact**—the **most dependable.** That's why it can be installed at the smallest expense.

Great Victories Won With Help of the Remy High Tension Magneto

The Remy has thoroughly proved its superiority by **performance.** Here are some of the 1908 victories in which the Remy played an important part:

Indianapolis Auto Races, Sept. 18-19—At the two-day meeting the Buick cleaned up on the first day's program and made an excellent showing the second day, defeating cars costing as high as $4,000. The Buick-Losey Company who handle the machine declare most of their success was due to the fact that their cars are equipped with the Remy magneto system of ignition.

Labor Day Races, Lowell, Mass.—The Buick Motor Car Co. says, "Remy Magnetos used on our cars gave entire satisfaction. Our cars ran faultlessly throughout the whole race, and we can speak in words of highest praise of your Magneto."

Dead Horse Hill Climb, Worcester, Mass., June 6—Record broken for cars up to 20 H. P. by Cameron Three-Passenger Roadster equipped with Remy Magneto.

Economy Contest, Baltimore, Md., August 8—Won by Cameron Runabout equipped with Remy Magneto.

Hill Climbing Contest, Baltimore, Md., August 8—Won by Cameron Runabout equipped with Remy Magneto.

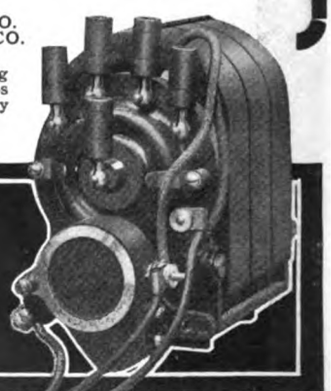
Knox Model L, 30 H. P., equipped with Remy Magneto defeated all cars of equal and several of higher power.

Norristown, Pa., Hill Climb, June 27—First place in $3,000 class, first in $4,000 class, and second in free-for-all gasoline cars won by Knox Model L, 30 H. P., equipped with Remy Magneto. Second place in free-for-all motive powers, and third place in free-for-all gasoline cars won by Knox Model M, 60 H. P., equipped with Remy Magneto.

Arrowhead Hill Climb, New York City, July 11—Won by Knox Model L, 30 H. P., equipped with Remy Magneto.

Shingle Hill Climb, West Haven, Conn., May 27—First place for 30 to 35 H. P., and second place in free-for-all won by Knox Model, 30 H. P., equipped with Remy Magneto.

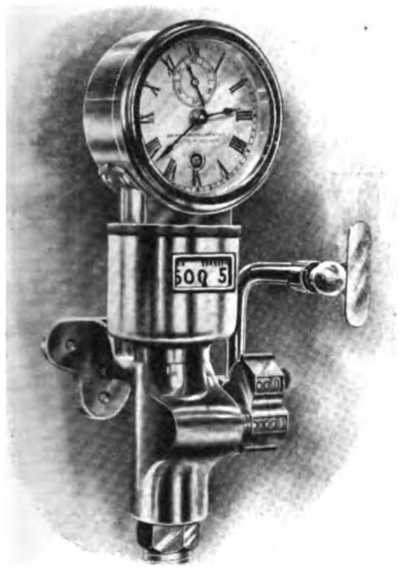
Rockville, Conn., Hill Climb, June 30—First place in $3,000 class, first in $4,000 class, second in free-for-all and third in free-for-all stock cars won by Knox cars equipped with Remy Magnetos.



These manufacturers are regular users of the Remy and more Remys are being specified every day for the cars of other makers:

BUICK MOTOR CO. OVERLAND AUTOMOBILE CO. NORDYKE & MARMON CO.
CAMERON CAR CO. MAXWELL-BRISCOE MOTOR CO. HAYNES AUTOMOBILE CO.
MIDLAND MOTOR CO. APPERSON BROS. AUTOMOBILE CO.

Write us for illustration and full description of our new High Tension Magneto. We are building them in such large quantities that we can make you very attractive prices. We also build magnetos for double ignition and alternating and direct current magnetos for all ignition purposes. It will pay you to investigate. Address Dept. 11.



New York Office, Thoroughfare Bldg., Broadway and 58th Street.

THE Warner Auto-Meter

In a 20,000-Mile Endurance Test

Four Trips Daily between Pontiac and Detroit, Mich.—200 Miles Every 24 Hours

The Auto-Meter in this double daily century run is attached to a Chalmers-Detroit "Thirty."

Four times every day—rain or shine, muddy or smooth roads—this car equipped with the Warner Auto-Meter leaves Hotel Pontchartrain at Detroit for Pontiac, Mich., and return.

The Auto-Meter is attached to the dash and is depended upon to keep the schedule exact and make the different points at the terminals and en route within the required time.

The Auto-Meter was necessary because in such a gruelling test, where a certain speed must continually be maintained in a specified time, it could be relied upon to be accurate.

Silently and surely it does it work in any weather, under any conditions. To the fraction of a second or the fraction of a mile the Auto-Meter's record is in fallible.

The Auto-Meter is used everywhere one wants to know exactly how far and how fast

In the New York-to-Paris Race, the Thomas, the winner and only American contestant was equipped with an Auto-Meter. The drivers of the famous car give the Auto-Meter due credit for its "silent assistance," which they say materially aided them in winning.

The AutoMeter **always** has been used by the Glidden Pathfinders when they lay out the routes for the Glidden tour, because they know its accuracy may be relied upon.

On the dash of the best cars you will find an Auto-Meter. Owners now find it a necessity as well as a convenience.

We frankly admit there are indicators at less cost, but in an out-and-out comparison where accuracy is demanded to a fraction, the reliable Auto-Meter is the only one that stands the test.

A speed indicator (?) that can't be depended upon is an incumbrance. Write for more details and arrange for a trial of the Auto-Meter.

Hereafter, Call It

THE WAVERLEY ELECTRIC

(Formerly the Pope-Waverley)

The Pope interests having been purchased by a syndicate of prominent Indianapolis business men, the Waverley plant of the Pope Motor Car Company will hereafter be operated as an independent concern by the Waverley Company. The factory and sales organization remains unchanged.

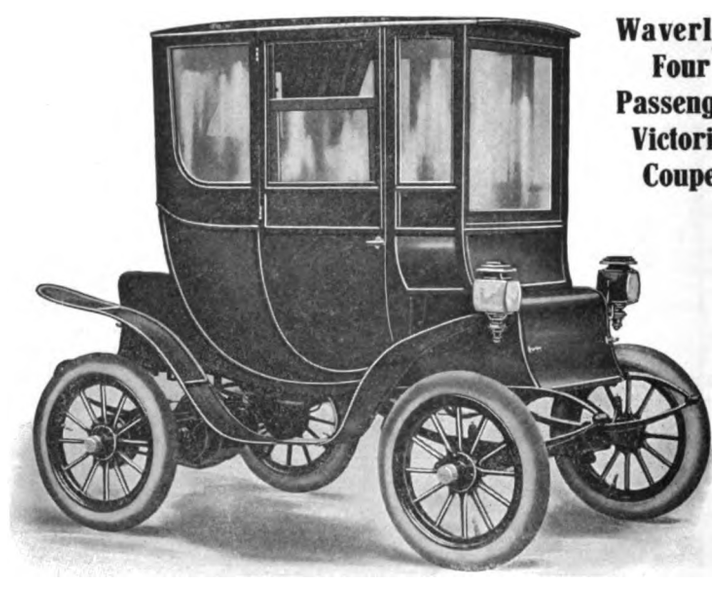
Backed by ample capital, the new Waverley Company will devote its whole time to the manufacture and sale of the famous Waverley Electric—the standard of electric automobiles.

The Best Electric To Buy—And The Easiest To Sell.

No other electric has ever approached the famous Waverley in practical efficiency. Where great mileage is demanded by the purchaser—a hundred miles or more on one battery charge—the Waverley can give him more of it than any other electric, at no greater expense.

Where a more practical radius of travel satisfies the purchaser—say, 50 to 60 miles per charge—the Waverley gives it a lower cost per mile than any other automobile, gasoline or electric.

The noiselessness, simplicity, cleanliness and economy of the Waverley Electric are daily increasing its well-known prestige. No other electric is so stylish or so durable. No other vehicle, horse-drawn or power driven, is so thoroughly dependable.



The sales have been increasing by leaps and bounds for several years.

The Waverley Electric for the coming season will be even better than it has been, and an even better proposition for good dealers.

The sales will be pushed as they they have never been pushed before.

Now Is The Time For The Dealer To Write About His Territory

The Waverley Co. Indianapolis, Ind.

Waverley Four Passenger Victoria Coupe

Popular All The Year Around.

This handsome vehicle gives splendid service when gas cars are hibernating and horses demand "humane" treatment. The Coupe Top is removable, giving a perfectly enclosed coupe for stormy weather, and a stylish open Victoria Phaeton for summer.

Price: With Removable Coupe Top, $2,150.

Premier In a Three-Fold Victory

In the fully Sealed Reliability Contest of 250 miles per day for four consecutive days, held under the auspices of the Chicago Motor Club the PREMIER scored three victories.

FIRST—The only Premier entered won the Standard Oil trophy for the lowest gasoline consumption over many cars that, with full passenger load, weighed at least 1,000 pounds less than did the Premier. THIS RECORD FOR ECONOMY IS NOTEWORTHY.

SECOND—The Premier made a perfect road score, finishing with all seals intact, in a contest which was most severe by reason of the amount of mileage per day and the condition of the roads traversed.

THIRD—The Premier was awarded a perfect score by the Technical Committee who made a most thorough and complete examination of all the cars at the finish of the run to determine any weaknesses which might result from the strenuous road performances.

The Premier's great record in the event just ended is a fitting climax to a season of Premier victories.

Again We Ask—Can You Beat It?

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. **THE BRAMPTON CHAIN** is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like **THE CELEBRATED BRAMPTON CHAIN** because some of the other chain makers began to copy the design and shape of the **BRAMPTON CHAIN** links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the **BRAMPTON CHAIN** than ever before. These chains somewhat resemble the **BRAMPTON** in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the **BRAMPTON MOTOR CHAIN** in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the **BRAMPTON FILLS THE BILL**, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the **CELEBRATED BRAMPTON CHAIN** if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

45 H. P. $3,000

HAYNES

Victory!

TWO PERFECT SCORES AT CHICAGO

CHICAGO, Oct. 10.—In the great Thousand-Mile Endurance Run of the Chicago Automoblile Club, the two Haynes entries secured two of the five Perfect Scores out of 17 contestants. Several cars had more than one entry, but only the Haynes secured more than one Perfect Score.

This remarkable showing recalls the corresponding event of last year where the single Haynes entry won the only Perfect Score that was awarded.

There is real value in these tests. Any car in skillful hands with good luck can attain a perfect score in ordinary Endurance Runs where the operator is allowed to fuss with his car whenever it is necessary. But in these tests the car had to go through untinkered and pass a rigid examination of its condition at the end.

Haynes cars will always win in such tests.

For 1909 One Model, 45 H. P., $3,000. Four types of body.

Stewart Speedometer

Complete with Enclosed Season Odometer $15

Model 12

$15

Some weeks ago we announced a startling Speedometer proposition for 1909 and we have kept our word. Last week's issue contained our full announcement for the 1909 season—the most beautiful line of speedometers ever shown, including **Model 12, at the unheard of price of $15 for a complete and guaranteed Speedometer and Season Odometer.**

This thoroughly high grade complete and guaranteed instrument is not to be confounded with ordinary $15 speedometers stripped of their essential season odometers, and without which no speedometer is complete, and which will be offered the trade in a makeshift pretense of meeting our impossible competition.

Don't be confused by offerings of even higher priced speedometers which may be equipped with ordinary external odometers, *not in any way the equal of the Stewart enclosed odometer.*

Model 12 is the handsomest 3-inch speedometer ever produced. Indicates speed up to 50 miles. Has an enclosed season odometer with capacity of 10,000 miles and repeat. The workmanship, materials and construction of this beautiful model are of the same high standard used in all our speedometers, and which has made possible our famous *FIVE-YEAR GUARANTEE,* which still stands unchallenged.

This model is *GUARANTEED ABSOLUTELY FOR FIVE YEARS,* and is equipped with our famous Stewart flexible shaft and patented swivel joint (*without which no speedometer can continue to give satisfaction*), exactly the same equipment used on our higher priced models. We make no exceptions; we sacrifice nothing to accomplish the lower price. Compare this costly equipment with the troublesome wire core shaft and non-swivel devices which are a part of the equipment of other speedometers.

A Thoroughly High-Grade Instrument

designed to meet the requirement of the small car. It is far better than any other speedometer, of any make at any price, as a trial alongside any other will prove. *Ready for delivery about Nov. 1st.*

Matheson

1909
Prices Reduced $1,000
And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for **the best.**

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still **maintain the unequalled quality** of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by **doubling the factory output** and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital **has been increased by** $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, **at the makers' former prices to the agent or dealer;** namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5,500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

MATHESON AUTOMOBILE COMPANY
Main Sales Office, 1886-1888 Broadway, New York City

STEVENS-DURYEA
NEW MODEL X

supplies the demand for a four-cylinder car, a little larger and more powerful than the Stevens-Duryea four-cylinder Model R, which has been discontinued. The owner of the Model X can feel that the well-known features of the Model R are embodied in his car together with the advantages of more room and power.

The Model X is an enlargement and refinement of the Model R, representing the most advanced ideas in automobile designs together with Stevens-Duryea construction and workmanship, which have been proven absolutely correct.

Price, with standard finish and equipment, **$2,750**

Send for New Model X Catalog.

The Vital Features of This Car.

THE offset crank shaft and straight line drive, more than any other features are responsible for the unusual efficiency, the high delivered power and the wonderful flexibility of control of this four cylinder, five passenger

Rambler

Most automobiles can develop sufficient power at high speed, but the owner's greatest need is for power at slow engine speeds—power on the hills—in stretches of sand and mud.

The offset crank shaft and stright line drive give flexibility, allow more high gear work without overtaxing the engine; that means less gear changing; less clutch manipulation—therefore ease and economy of operation.

This car can be throttled down to operate smoothly and steadily on high gear at three miles an hour. Or it can run forty-five miles an hour.

These features besides those big wheels, big tires, long wheel base, accessible engine, safety starting device, reinforced tubular axle, finished parts of genuine mahogany, perfect brake control, and large luxurious body, make this a car of highest quality.

Ready for immediate delivery. Please write for details now.

STUDEBAKER ABSORBS GARFORD

Final Steps Being Taken to Complete the Merger—New York Company Ended in the Arrangement.

No small amount of surprise will be occasioned in the trade by the announcement that the Studebaker Automobile Co., of South Bend, Ind., is to absorb the Garford Co., of Elyria, O., and the Garford Motor Car Co., of New York, which latter has had the eastern distribution of Garford cars. The final negotiations for the complete merging of the Garford in the Studebaker interests are being completed this week. This action represents another step in the big policy which the Studebaker company has entered upon, and which has already resulted in its undertaking the marketing of a large part of the E-M-F product both at home and abroad, and the production of buggy type motor vehicles, in addition to handling its regular line of Studebaker models.

For some time the Studebaker interests have been heavily represented in the ownership of the Garford Co.'s stock. The Studebaker chassis have also been produced at the Garford's plant, so that the relations between the companies has been very close. At one period the Garford plant at Elyria produced the Studebaker, the Rainier and the Cleveland chassis, but upon the subsequent withdrawal of both the Rainier and the Cleveland companies from this arrangement, the former to manufacture in its own plant, it was decided that the Garford Co. should market a model of its own. The Garford car was produced last year, and the Garford Motor Car Co. of New York was organized in July, 1907, with $300,000 capital, to handle its sale east of Buffalo. To head the New York company, William B. Hurlburt was chosen as president, under "inducements" of such attractiveness as finally to persuade him to relinquish the management of the Packard Motor Car Co. of New York, to go with the new enterprise. C. R. Teaboldt became his assistant, as secretary and treasurer of the company, and a large salesroom and warehouse on Broadway, near Forty-sixth street, New York City, was engaged.

Under the merger, this business is all to be acquired by the Studebaker interests, and will be handled from the Studebaker building, a little further up the street. In winding up the affairs of the company, terms that are satisfactory to Hurlburt and Teaboldt, with their associates, are being arranged. Inasmuch as Hurlburt and his organization are considered among the best equipped automobile men in the country, their early connection with another of the big automobile companies is not unlooked for.

Baker, of New York, in Bankruptcy.

Bankruptcy proceedings have been filed against the Baker Motor Vehicle Co. of New York, located at 1788 Broadway, New York City, and Judge Holt has appointed James N. Rosenberg as receiver. The liabilities are reported to be about $100,000, and the assets from $20,000 to $30,000. The company was organized on August 16, 1907, under New York laws, with a capital of $20,000, and Nathaniel Platt as president, to act as New York agent for the Baker Motor Vehicle Co. of Cleveland, O. Among the petitioning creditors are: Electric Storage Battery Co., $7,464; Diamond Rubber Co., $1,439, and Anthony G. Imhoff, $600.

Remy Opens an Eastern Office.

Headquarters in New York for the Remy Electric Co., of Anderson, Ind., have been established at 211 Thoroughfare building, on Broadway at Fifty-eighth street. H. J. Hinley is in charge, and will superintend the distribution of Remy magnetos and ignition apparatus in the East.

New York Store for Gray & Davis.

Gray & Davis, of Amesbury, Mass., have opened a branch in New York City for the sale of their lamps. It is at 377 Broadway, and will be under the direction of William H. Gray.

SUES ON "BASIC" BUGGY PATENTS

Action Against Two Makers of High Wheeled Vehicles—Sweeping Infringement Prosecution Threatened.

In the role of the Selden of the high-wheeled motor vehicle, the Success Auto-Buggy Mfg. Co., of St. Louis, Mo., has started suit for injunction against the W. H. Kiblinger Co., of Auburn, and the Economy Motor-Buggy Co., of Fort Wayne, Ind., and is threatening similar action throughout the field generally, where its patents are thought to be infringed. The petition filed by the plaintiff in the United States Court at Indianapolis, Ind., on the 12th inst., asserts that both the defendant companies entered into an agreement to pay the Success Company a royalty of $15 per buggy, but that the defendants have failed to carry out their agreement. An injunction is asked restraining them from further manufacturing of the vehicles alleged to be affected by the patents, and an order for an accounting is petitioned for.

Claims are made by the Success Company that it "holds several valuable patents on all the most important parts of high-wheeled motor buggies." To support its priority in the motor buggy line, the company points out that four years ago its product was placed on the market, and so distinctly was the vehicle of the real buggy type that the first photograph of the early machine discloses a whip-socket on the dash which the builder had accidentally overlooked. A vigorous and sweeping prosecution of alleged infringement, will be commenced immediately, it is announced.

Duerr Creditors' Meeting Called.

A meeting of the creditors of C. A. Duerr & Co., Inc., of New York City, has been called by Lindsay Russell, the receiver. It will be held at 2 p. m. Wednesday, the 14th instant, in room 1,314 of the City Investing Building, New York.

In the Retail World.

Edward Wilkie has been appointed manager of the new Buick branch in Philadelphia, Pa. Quarters have been obtained at 235-237 North Broad street.

George B. Levy, who has been secretary and sales manager for C. A. Coey & Co., of Chicago, Ill., has gone in business for himself. His concern will be known as the Standard Automobile Supply Co., at 1428 Michigan avenue.

I. R. Gardinier is the president and general manager of the newly organized Franklin Motor Co., which is to handle Franklin cars exclusively in Utica, N. Y. The company's headquarters are in the Commercial Travelers' building.

Distribution of Continental tires in northeast and middle New York State will hereafter be made through the Albany Hardware & Iron Co., of Albany, N. Y. Both the tires and their accessories will be sold under the same terms as at the New York headquarters.

The sale of all the property of the bankrupt R. O. Williams Automobile Co., of Columbus, O., by the receiver, H. C. Moore, has been confirmed by Judge E. B. Dillon. The purchaser was M. F. Loofbourrow, and the price $2,039.57, did not include the previous sale of one automobile for $147.50 to another buyer.

Representation in Detroit, Mich., for the Studebaker cars has been brought about by the erection of a garage and retail salesroom on the property of the Everitt-Metzger-Flanders Co., on Piquette street. The full line of Studebaker gasolene and electric vehicles will be shown in connection with the E-M-F models.

Rambler Branch Moves to New York.

The distribution of Rambler cars which has heretofore been handled from the Philadelphia branch of Thomas B. Jeffery & Co. will from now on be made from New York, the branch having been moved over after four years in the Quaker City. Headquarters have been obtained at 38-40 West Sixty-second street, in charge of Manager Hutchinson, and from 75 to 100 cars will be kept in stock. The wholesaling territory to be covered includes Eastern New York, New Jersey, Delaware, Maryland, Virginia and that part of Pensylvania east of Altoona. The New York City agency for the Rambler will remain with the Homan & Schulz Company.

Altruistic Association Assigns.

Wholly unappreciative of the beneficent services which it was ready to perform for them, the automobilists of the country have let the Association of Motor Car Owners, with offices in the Times building, New York City, get into such straights that it has been forced to make an assignment. The concern was incorporated March 7, 1907, with a capital stock of $10,000, "to audit and adjust automobile expense accounts, furnish supplies, act as agent and to perform other services for automobile owners." Its highwater mark for membership was 300, but the tide soon went down, and a disagreement among the stockholders last month resulted in its bank account being tied up. An assignment to John H. Winans has been signed by Joseph D. Belasco, president, and Benjamin B. Dolaro, general manager. The assets consist of cash in banks, $1,603; accounts, $2,100, and office furniture, value not given.

Dunlop Punishing Price Cutters.

Fighting for the maintenance of price agreements with the jobbing and retail trade is being carried on across the Atlantic as well as on this side, the Dunlop Pneumatic Tire Co. having recently instituted a series of actions for violations of contracts governing the prices at which it products should be sold. One defendant jobber has been enjoined and required to pay $200 not only for cutting contract prices, but for letting dealers have the Dunlop goods without obtaining in turn written agreements that they would hold to the figures set by the company.

Goshen May Get the Crescent.

Already rich in the number of motor concerns that have either started up or are going to start in its borders, Goshen, Ind., has another prospect in view, the Crescent Automobile Co., of Detroit, Mich., having indicated that it will probably move into one of the town's vacated soap factories. The company, which is making the Marvel and Excelsior cars, has secured an option on the building and will make its decision within a few days. No bonus or stock subscriptions are asked.

Edwards Again with Hartford Rubber.

Teddy Edwards, after casting his fortunes with a newly organized rubber company, which later went into a decline, and subsequently acting as a traveling representative for a Hartford jobbing house, has returned to the Hartford Rubber Works Co., with whom he made his most conspicuous success as a salesman. He will cover his old territory.

Webster's New Marketing Method.

By an arrangement between the Webster Manufacturing Co. and the Randall-Faichney Co., of Boston, Mass., the latter company will hereafter market the Webster gasolene gauge, in addition to its own line of oil guns and accessories. One set of travelers will push the sale of the gauge and the Randall-Faichney products.

Adding to the G & J Factory.

An addition costing $50,000 is being made to the plant of the G & J Tire Company at Indianapolis, Ind. Although night shifts are still running, the present capacity of the factory is overtaxed.

The Week's Incorporations.

Pontiac, Mich.—Oakland Motor Car Co., under Michigan laws, increases capital stock from $200,000 to $300,000.

Chicago, Ill.—Mitchell Automobile Co., under Illinois laws, increases capital stock from $1,000 to $20,000.

New Rochelle, N. Y.—Jones Speedometer, The, under New York laws, with $100,000 capital; to manufacture indicators and devices. Corporators—J. W. Jones, G. L. Holmes and T. S. Barrett, New York City.

Rochester, N. Y.—Elbridge Engine Co., under New York laws, with $25,000 capital; to manufacture motors, vehicles, etc. Corporators—L. J. Seeley, Rochester; G. E. De Long, Syracuse; W. H. Salmon, Buffalo, N. Y.

Rockaway Beach, N. Y.—Queens Motor Works, under New York laws, with $3,000 capital. Corporators—John P. Levins, 1422 Madison avenue; Edward Heinz, 1514 Madison avenue; Francis W. Heitman, 127 Summit avenue, New York City.

New York City, N. Y.—Cherry Autocab Co., under New York laws, with $25,000 capital; to make, sell and rent automobiles. Corporators—L. Stein, L. L. Doblin, 583 Broadway; A. S. Gilbert, 310 West Ninety-third street, New York City.

New York City, N. Y.—City Autocab Co., under New York laws, with $250,000 capital; cab livery and garage business. Corporators—L. F. Braine and Henry H. Gardiner, 32 West Fortieth street; Lloyd Milnar, 452 Fifth avenue, New York City.

New York City, N. Y.—J. Jensen, Inc., under New York laws, with $10,000 capital; to deal in and manufacture automobile parts. Corporators—Charles Jensen, Astoria, L. I.; Edward B. Wilson, Summit, N. J.; Frank Lockwood, 17 East Fifty-seventh street, New York City.

Death of Harold B. Stillman.

Harold B. Stillman, of Hartford, Conn., but well known in Philadelphia, Pa., through his connection with the Foss-Hughes Motor Car Company, died in Hartford on the 12th inst. He had been ill with typhoid fever for four weeks. His connection with the automobile trade commenced several years ago with the Mercedes Import Company in Philadelphia, after which he joined the forces of the Foss-Hughes company. Latterly he directed a large part of the activities of the commercial vehicle department of the Knox Automobile company, of Springfield, Mass., as well. Although only twenty-four years old, he had won many friends and no little reputation in the industry. The funeral takes place in Hartford to-day, the 15th inst.

Jones Resigns from the Knox.

J. H. Jones, formerly chief engineer of the Knox Automobile Co., Springfield, Mass., has resigned. He will take up general practice.

RATING SALESMEN BY FORMULA

Maxwell-Briscoe System for Measuring up the Selling Organization—Method of Stimulating Its Efficiency.

While the efficiency of a selling organization is best expressed in terms of the goods delivered during a given period, many a sales manager has puzzled his head over the manifest unfairness of this method of rating ability when applied without direct reference to such local conditions as are governed by the extent of possible prospects, the costs of making sales and the hundred and one other factors which go to make up the burden of a salesman's life. In order to circumvent this difficulty as well as to blend the complete distributing forces into a more harmonious body, Benjamin Briscoe, president and general manager of the Maxwell-Briscoe Motor Co., has devised a system of rating salesmanship by formula. This altogether novel method of arriving at an important conclusion is incorporated into a new selling system which is about to go into effect, and which comprises a complete mapping out of the whole country under the management of a complete triangular organization.

The work of each member of the force is rated on a percentage basis according to the new formula method. Regular reports are transmitted to the headquarters of the company at Tarrytown, N. Y., and from the data they contain the "rank" is made out periodically, and published in the official house organ. At various intervals the names of the leaders in rank are to be published, and following this, the successful ones are to receive successive rewards according to their respective worth. The details of the system as told by its originator are as follows:

"The country has been divided into nine great districts and over each is a district manager. Each district is divided into blocks and over each block is a block man. Each block is divided into small sections and in charge of these are the dealers. That is the framework of the organization, with the exception that in nine of the great cities are established branch houses, each overseen by a branch manager.

"The district manager is, of course, responsible to the company for his district and for the sales made there. He comes into close contact with the block men who travel around constantly and help the individual dealers in every way they can.

"Every week, the district manager receives reports from all his dealers as to their progress. These are forwarded to Tarrytown and there referred to a department of statistics, where the average of each man will be computed according to formula. . . . . These averages will be compiled in the following classes: District managers, branch house managers, block men, branch house salesmen, regular dealers, and certificate dealers.

"The first formula will be used to compute the averages in the first three classes. Let X be the manager's average. Then

$$X = \frac{\text{Gross Receipts}}{\text{Population in units of 100 persons}} \times \frac{\text{Number of cars sold}}{\text{Total Cost of making sales}}$$

"Take for example a district of 3,500,000 persons. If 400 cars are sold for a total of $350,000, and the cost of selling them amounts to $4,000, the formula will read as follows:

$$X = \frac{350{,}000}{35{,}000\ (00)} \times \frac{400}{4000} = \text{unity} = 100\%$$

This means that if a thousand dollars is received from every ten thousand persons and the cost of selling does not amount to more than $10 per car, the manager's record will be considered perfect. Take another case, a more probable one: suppose a district of 7,500,000 persons takes 500 cars and pays for them a total of $500,000, the cost of making sales amounting to $8,000. Then the formula will read:

$$X = \frac{500{,}000}{75{,}000\ (00)} \times \frac{500}{8000} = \frac{25}{60} = 41\tfrac{2}{3}\%$$

"The formula for computing the averages of salesmen comprises only two factors: the total receipts and the population. Let X represent the dealer's average. Then

$$X = \frac{\text{Gross receipts in dollars}}{\text{Population in units of five persons}}$$

"Take another suppositious case: supose in a city of 500,000 persons, the dealer sells cars to the amount of $100,000. Then the formula reads:

$$X = \frac{100{,}000}{100{,}000\ (500{,}000 \text{ in units of } 5)} = \text{unity} = 100\%$$

"Suppose also that a city of 600,000 persons takes $20,000 worth of Maxwell automobiles. Then

$$X = \frac{20{,}000}{120{,}000\ (600{,}000 \text{ in units of } 5)} = \frac{1}{6} = 16\tfrac{2}{3}\%"$$

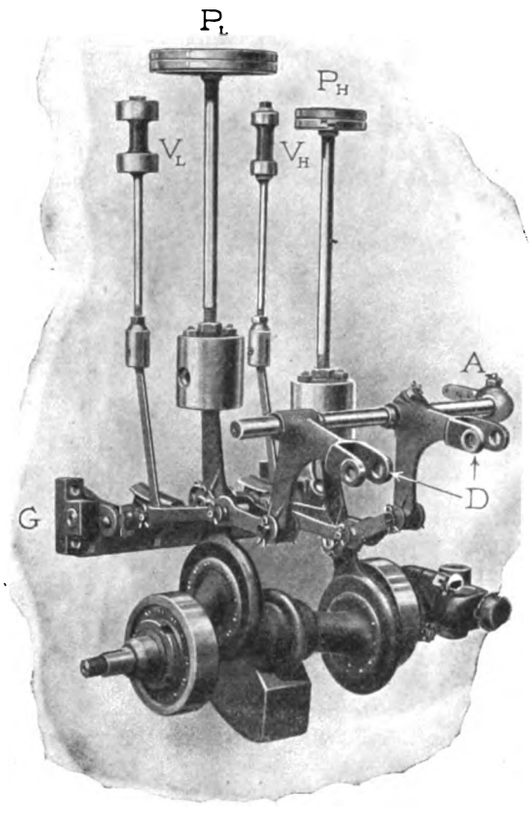
In regard to the further operation of the system he continues. "First, the photographs of the leaders are to be published in 'The Co-Operator.' Second, the year is to be divided into three periods of four months and the leading district manager, the leading branch house manager, the leading branch house salesman, the leading block man, the leading certificate dealer of the whole country, also the leading regular dealer of each district, will receive a medal. If he qualifies a second time, a larger medal is his; if he qualifies a third time, his medals are made into a watch fob and he is presented with a gold watch to wear with it. And the men, classified in the same way, who lead for the whole year, will receive automobiles."

PONTIAC PLANT FOR CARTERCAR

Drops Its Old Name, Raises the Capitalization, and Moves from Detroit—The New 1909 Models.

Simultaneous with an increase in its capitalization to a total of $350,000, the Motorcar Co., of Detroit, Mich., has made application for a change in the corporate name, with the result that the concern will in the future be known as the "Cartercar Company." These changes are the accompaniments of the company's removal from Detroit to Pontiac, Mich., where a factory very much larger than the Detroit plant has been secured for the production of the various Cartercar friction driven models and the manufacture of a high wheeled buggy type of vehicle. The factory which the Cartercar Company will occupy comprises the brick and concrete buildings heretofore used by the Pontiac Spring and Wagon Works, which cover two acres of ground and are five stories in height.

The work of moving the factory from its present situation on Twenty-first and Baker streets, Detroit, to the new location, will be commenced at once, and it is expected that all of the machinery and equipment will have been transferred and set in place within a period not exceeding 30 days, after which work will be commenced vigorously with a view to making possible the quick delivery of the 1909 models. The fact that the Pontiac factory is located at the junction of the Detroit, Grand Haven & Milwaukee and the Michigan Air Line railroads is regarded as an important freight and transportation advantage, which will expedite both the receipt of material and the shipping of cars.



For the coming season, the product will comprise, among others, a new runabout, which is to be brought out under the designation of Model "K," and Model "G," a gentleman's roadster, which will be subject to a few refinements in finish and mechanical detail and will be continued for another season. Model "A" will be discontinued, to be succeeded by an entirely new touring car which is to be called the Model "H." In addition to these models the company will produce a high wheeled motor buggy, continuing the name "Pontiac" under which a former product of the Pontiac Spring and Wagon Works was offered.

Wichita's Show for Vehicle Dealers.

High-wheeled and other types of automobiles are to have a show by themselves at Wichita, Kan., during the annual convention of the the Southwestern Kansas and Oklahoma Implement and Hardware Dealers' Association. F. L. Wright, of Wichita, the secretary of the association, has arranged for the exhibition to take place in the Auditorium building, December 8-9-10.

The Simplicity of
THE WHITE STEAM CAR

In the accompanying illustration are shown the working parts of the 1909 White steam engine. First of all will be noted the assembled crank-shaft which we showed, part by part, in last week's advertisement. Next we call attention to the high-pressure piston, P_H, and the low-pressure piston, P_L. Each stroke of each piston, up or down, is a working stroke. It will thus be seen that, as regards continuous application of power, the two-cylinder White engine is equivalent to an eight-cylinder gasolene engine of the usual four-cycle type.

The valve construction of the White engine is of extreme simplicity. There is but one valve for each cylinder, V_H being the valve for the high-pressure cylinder and V_L the valve for the low-pressure cylinder. The valves are of the balanced type—that is, the steam pressure is the same on opposite sides. Therefore, the valves do not work against pressure and the power needed to operate them is practically nothing. The valves are driven from the connecting rods by means of levers, as shown in the illustration. The engine is reversed and the "cut-off" is altered by simply tilting the guide, G. Those who are familiar with the valve mechanism of the gasolene engine will appreciate that the White construction is by far the simpler.

Write for circular containing details of the new White cars.

Parkway Criticism and Performance.

Notwithstanding the drawback of poor attendance and the inevitable minor difficulties which are involved in the launching of any great undertaking, the Long Island sweepstakes of Saturday last must be regarded a successful and altogether fitting inaugural for the course which has been so long in prospect. Whatever may have been the interest which naturally centered about the event because of its own merit, however, it was upon a relatively small portion of the circuit traversed by the cars that attention was chiefly focussed. The first section of the Parkway to be completed was on trial. That the result amply justified practically all that had been predicted for it is a matter of great credit to its founders, as to those under whose active management it has been built.

During the brief period of initial practice drivers who had been over the track were loud in their protestations that its bridges were approached at too steep grade, and that the curves were not properly banked. It was said that cars of medium or short wheel base approaching these points at high speed were thrown upward by the abruptness of the grades, and startling tales were told of experiences which were alleged to have occurred in which even large machines had literally jumped clear of the course. Another ground for criticism, which at first sight appeared to be more reasonable, was that the roughened surface of the course was likely to prove extremely hard on tires. The uniformity of the surface eliminated the danger of punctures, it was said, but, against this, the rate of tire wear, it was thought, would prove to be disastrously high.

Judged by the incidents of the sweepstakes, wherein thirty-odd cars of every possible description were raced side by side on both the course and the highway, these objections appear to be practically groundless. Indeed, it was a remarkable coincidence that of the few mishaps which occurred in the race, none of moment should have taken place on the cement track. Even the tire troubles were confined chiefly to the road, and though repeated changes were made at the grandstand control, most of the wear seemed to have been occasioned by the inequalities of Nassau County roads. Skidding was practically unknown on the track, and the maligned bridges failed to throw any of the racers over, as it had been predicted they might do.

One criticism only appeared to the onlooker to be valid. The underneath crossings, where the cars must pass through short tunnels, allow none too wide a margin for two machines to pass. In the event of one car overtaking another at one of these points an involuntary swing of the steering wheel, or a slight amount of side slip, might cause a serious disaster. This danger is augmented by the observed fact that some of the machines, instead of answering to guidance promptly, tend to slide at the forward end, the inertia of the vehicle being so great as to overcome in part the traction of the front wheels. This defect, however, may be chargeable rather to defective weight distribution in the machines themselves than to any fault of the course.

The cause of the Long Island Motor Parkway has been advanced as that of a private boulevard rather than a race course—hence the name chosen for it. The section completed, it must be admitted, presents few of the scenic possibilities which are a probable necessity to a popular motoring ground, though stretches yet incomplete probably do not possess this drawback. The flat, uninteresting countryside in the immediate vicinity of the grandstand, while admirably suited to a speedway, offers small inducement to the potterer. Hence, whatever the local attractions of other sections, it is likely that this end of the course will always remain rather more a speeding ground than anything else. That, however, cannot be construed into a crucial defect in the scheme as a whole.

Circular Units in Engine Rating.

A new turn is given to the subject of motor rating by the suggestion of Frederick Purdy that an extension of the electrical unit of the circular mil might be made adaptable to cylinder dimensions and even to such quantities as the sizes and areas of valves and ports. To the lay mind the scheme probably appears formidable in the extreme, as, indeed, might well be the case were it not considered rather in the light of a method of abreviation than an innovation pure and simple. Such, indeed, it really is. For the proposition is that of comparing, not piston areas and cylinder volumes, but the squares of diameters and these in turn multiplied by the strokes. Eliminate the term circular mil or inch or whatever, and merely bear in mind a constant numerical multiplier—always understood—and the principle is the same. The suggestion, then, is merely that of discarding from all ordinary comparisons a factor which is common to both terms of the ratio. The idea is that of simplifying a fraction by reducing it to its lowest terms.

So far as that alone is concerned, there appears to be small ground for objection to the principle or its application. Generally adopted, it would be of undoubted advantage, just as advantage lies in the adoption of any system of simplification Those who have wrought for the adoption of metric measure in shops where English is the rule, however, or who have striven to acquire the language of a new science, are well able to appreciate the probable confusion resulting from an attempt to alter the accepted method of expression. The idea is commendable. The probability of its acceptance, however, is not strong.

What is more to the point is the further suggestion that motors ought to be rated not on the basis of a common piston speed,

Digitized by Google

but with direct regard to the speed range for which they are designed. Until all motors are designed under common formulas, no single speed factor can be absolutely fair to all. The single compromise being in some instances so far out of the way as to yield results which are almost absurd, it is proposed to establish two speeds, one high and the other low, which may be supposed to mark off the probable limits of effective power production. Carrying out the idea to the extent of supposing two such limits to be established by a number of engineers of repute in convention, it is plain to see that that nuisance, the hyphenated horsepower, which it is so desirable to do away with, would be more firmly fixed than ever. As both of the values would be established on a uniform and presumably scientific basis, however, the objection would carry less weight than does that against the present usage.

Somehow all the prophets who foretold the death of racing interest in so far as the motor vehicle is concerned, a year or so ago, appear to have been confounded. During the past summer what may—or may not be termed a revival of racing interest has taken place and with increasing zest, race after race has been run. Just at present the "season" is at its height, and all over the country events of this sort are taking place. Though the attitude of the public toward these demonstrations is admittedly not what it was a year or two ago in many respects, yet popular support is not lacking. The past week has been signalized by a greater number of "big" events of either local or general moment than perhaps any other week in the history of the sport. That two cities in such close proximity as New York and Philadelphia should have had two as important races as the Sweepstakes and the 200 miles contest in Fairmount Park is remarkable.

The sub-division of the duties of the Racing Board of the American Automobile Association and installation of a part of them under the management of the newly constituted Contests Board, is an interesting, if logical development. Whether the lightening of its burden will encourage the older body to the manifestation of a new sort of stamina and acumen in the handling of the "national" events to which its attention must now be confined, will be equally interesting to observe.

A. A. A. MAKES READJUSTMENTS

Racing Board's Duties to be Confined to Speed Contests—Technical Board Renamed Contests Board.

Despite the promise of revolutionary developments, the regular quarterly meeting of the Board of Directors of the American Automobile Association, which was called for Friday, Oct. 9, failed to provide the expected sensation. Instead of a startling conclusion on the question as to "whether the fiscal plan should not be materially modified" and made to "include a moderate fee for the clubs instead of graded dues," an unexpected arrangement was put into effect whereby the status of the Racing Board is altered, so that that august body, though retaining its name, will hereafter "have charge of racing and speed contests." The Technical Board hereafter will be known as the Contests Board, and will have charge of all contests other than racing and speed contests.

This action was included in a series of amendments to the bay-laws which were proposed in President Hotchkiss's report. This was read in the absence of the president himself, First Vice-President L. R. Speare, of Boston, presiding. The text of the amendments follows:

"First—That the Touring Board be hereafter called the Touring, Information and Maps Board, and that it have its headquarters in New York City.

"Second—That the Technical Board be hereafter called the Contests Board, and that it have charge of all contests other than racing and speed contests; for instance, all touring, technical, endurance and economy contests, as well as hill climbing.

"Third—That the Racing Board retain its name, but hereafter have charge of racing and speed contests."

A further amendment provides for the representation of each affiliated club by directors to be nominated from such clubs by the respective state associations. This increased representation, besides doubling the size of the directorate, is planned to arouse local interest among the individual clubs and also to strengthen the position of the national body itself.

Among the plans for the forthcoming year is a scheme for holding a competition for commercial vehicles, incentive to the establishment of an annual contest of this sort being furnished by the offer of Powell Evans, president of the Automobile Club of Philadelphia, to donate to the A. A. A. a $2,000 trophy for the purpose, under a suitable deed of gift. The offer was accepted on behalf of the association.

Provision for the representation of the A. A. A. at the forthcoming "Great White Show" of the American Motor Car Manufacturers' Association was made in the acceptance of an offer made by that body to allot space to the association, in addition to which it was decided to hold open meetings during the period of the show. The executive Committee having previously referred to the president and secretary the solution of the California situation, wherein two state bodies are in existence, the matter was clarified by the adoption of a by-law amendment legalizing such a condition in a State having such large territory. R. D. Inman, of Portland, Ore., was elected a director, representing the Portland Auto Club.

COMING EVENTS

October 14-16, Cleveland, O.—Cleveland Automobile Club's reliability run.

October 15, 16, 17—Michigan State Automobile Association's endurance run.

October 17-18, Los Angeles, Cal.—24 hours race meet, Ascot Park.

October 17, Hartford, Conn.—Automobile Club of Hartford's hill climb, Avon Mountain.

October 17, Kansas City, Mo.—Automobile Club of Kansas City's race meet, Elm Ridge track.

October 24, Long Island—Vanderbilt Cup contest.

October 31, Philadelphia, Pa.—Automobile Club of Philadelphia's sixth annual tour for the Brasier Cup.

November 23, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

New Date for Fort George Climb.

Most of those who were involved in the Outlaw Motor Racing Association are now concerned in the promotion of a hill-climbing contest which it is planned to hold on Election Day, Nov. 3, and in which they are endeavoring to embroil sundry others whom their affairs do not materially interest. Having applied for permission to run the contest on Fort George Hill on Oct. 17, and the permission having been refused by the Mayor of New York City on a technicality, a second application was drawn up and presented to the Board of Aldermen on Tuesday of this week, and was favorably passed upon. In the matter of sanctions, the Automobile Club of America was first appealed to, the original announcements of the affair being tagged with an "international" label. The A. C. A., however, with rare wisdom decided that as the event was of purely local character, its recognition must be gained at the hands of the American Automobile Association. Accordingly that body will be petitioned by the New York Automobile Trade Association, Inc., which is the promoting organization. Entries will close on October 31st.

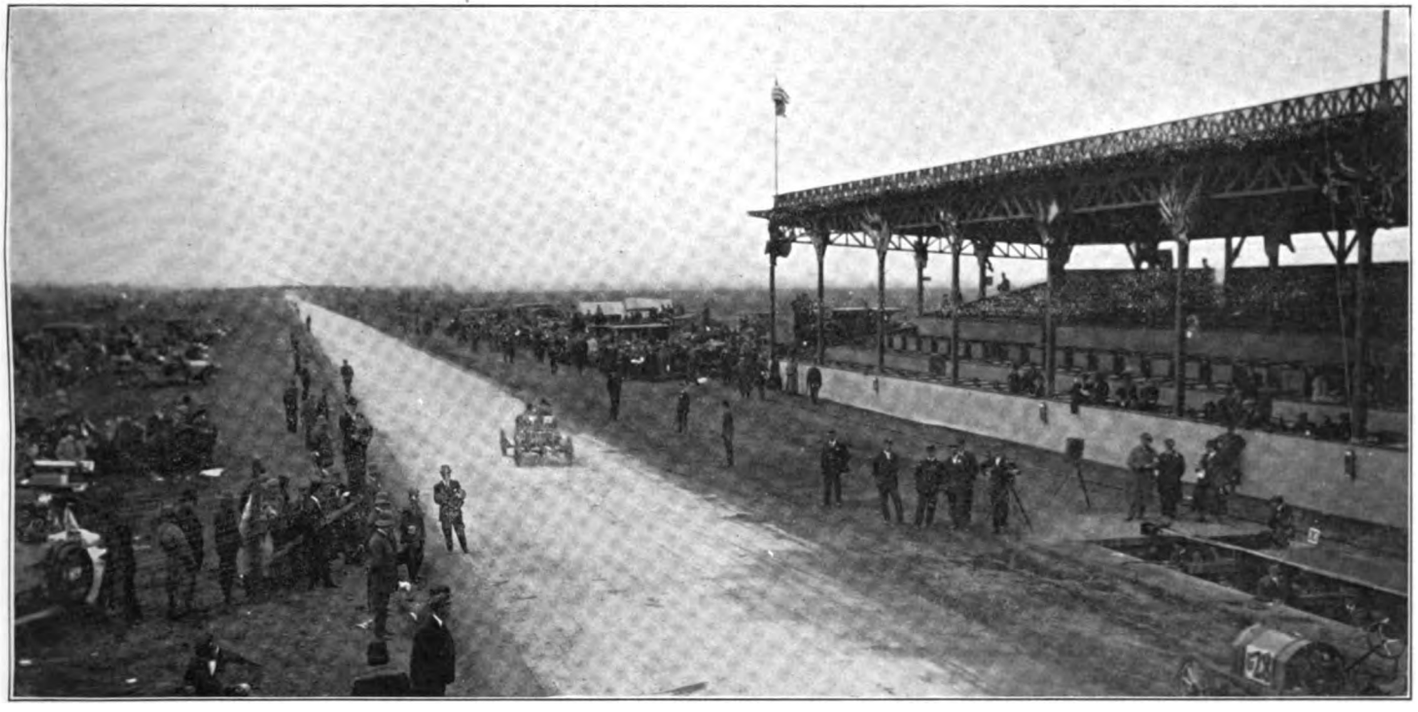
MOTOR PARKWAY'S OPENING RACE

Five Classes of Stock Cars in the Sweepstakes—Winners Make Fast Time—Lytle's Great Speed.

Almost a crowd of people saw the Long Island Sweepstakes, for stock cars, which on Saturday, the 10th inst., inaugurated the actual use of at least a portion of the new Motor Parkway. The expected stampede of visitors did not occur, and many of the lengthy special trains which the Long Island Railroad had waiting in rows with steam up, did not start for the reason that they were not needed, while the early morning procession of motor cars on the roads leading to the course was very slim.

The race or races—all the events being run at the one time—started at 9 o'clock in the morning and lasted well into the afternoon. Hardly a hint of anything suggesting the excitement of a Vanderbilt cup race was provided, with the exception of Herbert Lytle's rounds at terrific speed in the Isotta, with which he won the big event of the day. His average of 64.25 miles per hour exceeded the average rate made in any of the Vanderbilt cup races, and the way he drove gave all the appearance of the speed with which the timers credited him. Recently acquired marital responsibilities may have influenced Lewis Strang to caution, for while great things were expected of him, he drove his Renault carefully and unpicturesquely to a belated second position.



Of the 33 machines that lined up, the little cars were sent off first, at 30 seconds intervals. There were eight of them, competing in the Nassau sweepstakes, for cars selling at $1,000 or under. Their task was to go four laps, about 93 miles. Five minutes separated each bunch, and at 9:05 the first of the Jericho sweepstakes contestants, listed at from $1,001 to $2,000, was started. Seven competed in this class, to go 6 laps, or about 140 miles. Next came the seven Garden City sweepstakes cars, listed at prices between $2,001 and $3,000. They were required to go eight laps, about 187 miles. Only four contestants lined up for the Meadow Brook sweepstakes, for cars worth from $3,001 to $4,000. Nine laps was their portion, a distance approximating 211 miles. Last of all came the seven biggest cars, selling for $4,001 or more, to battle in the Motor Parkway sweepstakes. They had 10 laps to go, making 234.6 miles, the course being 23.46 miles, with about 8 miles of it on the Parkway and the balance dirt roads.

How it would all work out nobody could guess, as the bigger cars were certain to overtake their predecessors, and the way they set out from the starting line made it look as though they would do it quickly. Two of the first cars to start completed their first lap, however, without being overtaken, but thereafter the contestants in all the classes were soon strung around the course in one grand mixture. Subsequently the "Nassau" cars completed their four laps and the "Jericho" contestants their six laps, and when the 15 machines represented in these two groups had been flagged off and withdrawn, things were thinned out so much that the eight, the nine and the ten lap cars could go at top speed without fear of stumbling over the little fellows. The winners in these latter groups were finally winnowed out by the scorers, and the cars still running on the Parkway section of the course were permitted to finish at the grandstand.

Accidents were few, a broken arm being the limit of injury to those in the contest, although two spectators escaped less easily. The latter were struck with tools that were jounced from a car and which struck them in the head with serious effect. One car was overturned, while a broken axle, a few cases of running into the fence, and numerous minor mishaps that came more properly under the head of car trouble, prevented a total of 12 of the 33 starters from finishing. One car that was still running, was called off at the conclusion of the race.

Remarkably enough, though constituting more than a third of the total course, the Parkway was not the scene of any mishap. This fact encouraged the belief on the part of those responsible for its construction that it was in every way as safe as it had been planned to be, and that the adverse criticism of the abrupt grades forming the approaches to the bridges over the intersecting roads and of the sinuous turns, which had been rife up to the time of the race, was completely answered by the facts. Although private tests of the Parkway had been satisfactory, the Sweepstakes afforded the first service demonstration of how the cars would take the rises and the banking on the turns. As the contest contained such a variety of weights, speeds and power among the competitors, the affair gave about as complete a try-out as could be devised.

The idea that the hard concrete with its finely corrugated surface, which latter was obtained by "brushing" with steel brooms while the grouting was still in a paste-like state, would prove extremely severe on

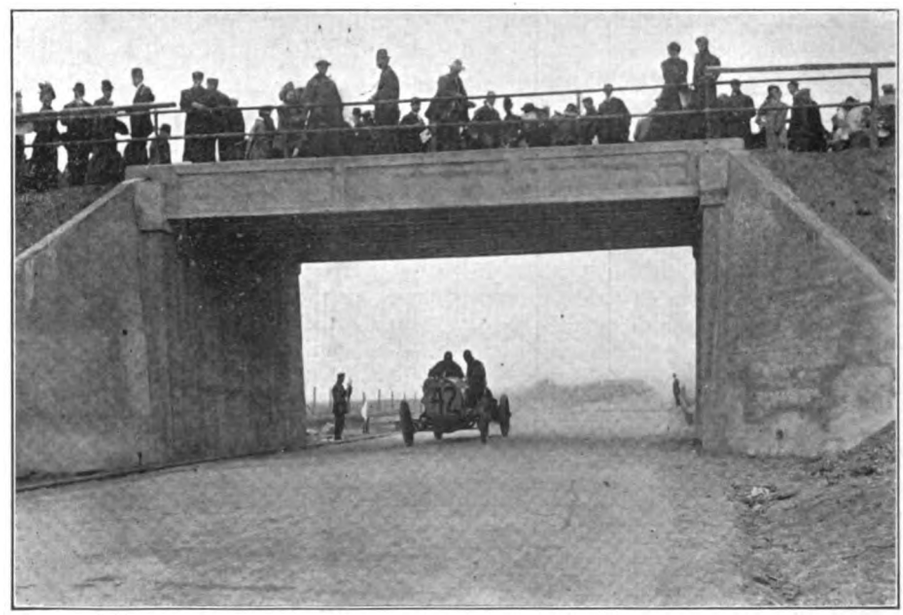
THE MOTOR PARKWAY, THE GRANDSTAND AND "THE CROWD"

Digitized by Google

tires seemed to fail of verification. The general opinion at the conclusion of the race was that the concrete, while presenting a surface like a magnified file in appearance, was really very easy on tires. Inasmuch as the Parkway is new, its freedom from dust may later be diminished by the dirt which will gather in the small depressions between the fine surface ridges, but during the sweepstakes the cars raised practically no dust whatever.

WAGNER CHECKS A FALSE START

By reason of the interest created through the fact that so many well known makers were competing with stock products and because of the curiosity as to how the Parkway itself looked and would bear the cars, the majority of the spectators felt well rewarded for their excursion. Conversely, as showing the merits of the competing machines, regardless of whether they won or not, and demonstrating the virtues of the Parkway as a special automobile road, the five-in-one Sweepstakes race was as conspicuous a success as had been promised.



Approach toward the riotously chromatic grandstand, either across the flat fields on foot from the special trains or by motor car, gives the impression that the biggest thing in connection with the whole Motor Parkway must be the bill for wire fencing. At a distance the gray wire strands are seen like a mist, particularly heavy at the grandstand's back and extending into the distance on both sides along the brilliantly white streak of concrete roadway. Nearer view shows the fencing enclosing numerous separate paths and windings to the grandstand itself, to the parking spaces, and the herding grounds for the vulgar, non-paying throngs. Some of the visitors with cars, who had paid $10 for parking space, were not able to find their way in, and in desperation apparently resorted to vandalism, using wire cutters to get through.

The 9 o'clock starting hour was easy for everybody, and even the misguided enthusiasts who had taken the 5:30 a. m. special train to the stand were subsequently reconciled to the fact that for lack of passengers it had not started until nearly 7 o'clock, since, as it was, they had a long, cold wait after arriving. For an hour before the start the space in front of the stand was filled with cars, the contestants being lined up before their respective repair pits for final tuning and preparation. As the starting time drew nearer, the machines bearing odd numbers, beginning with No. 1, were put Indian file on the right of the course, back of the line, and the even numbers on the left.

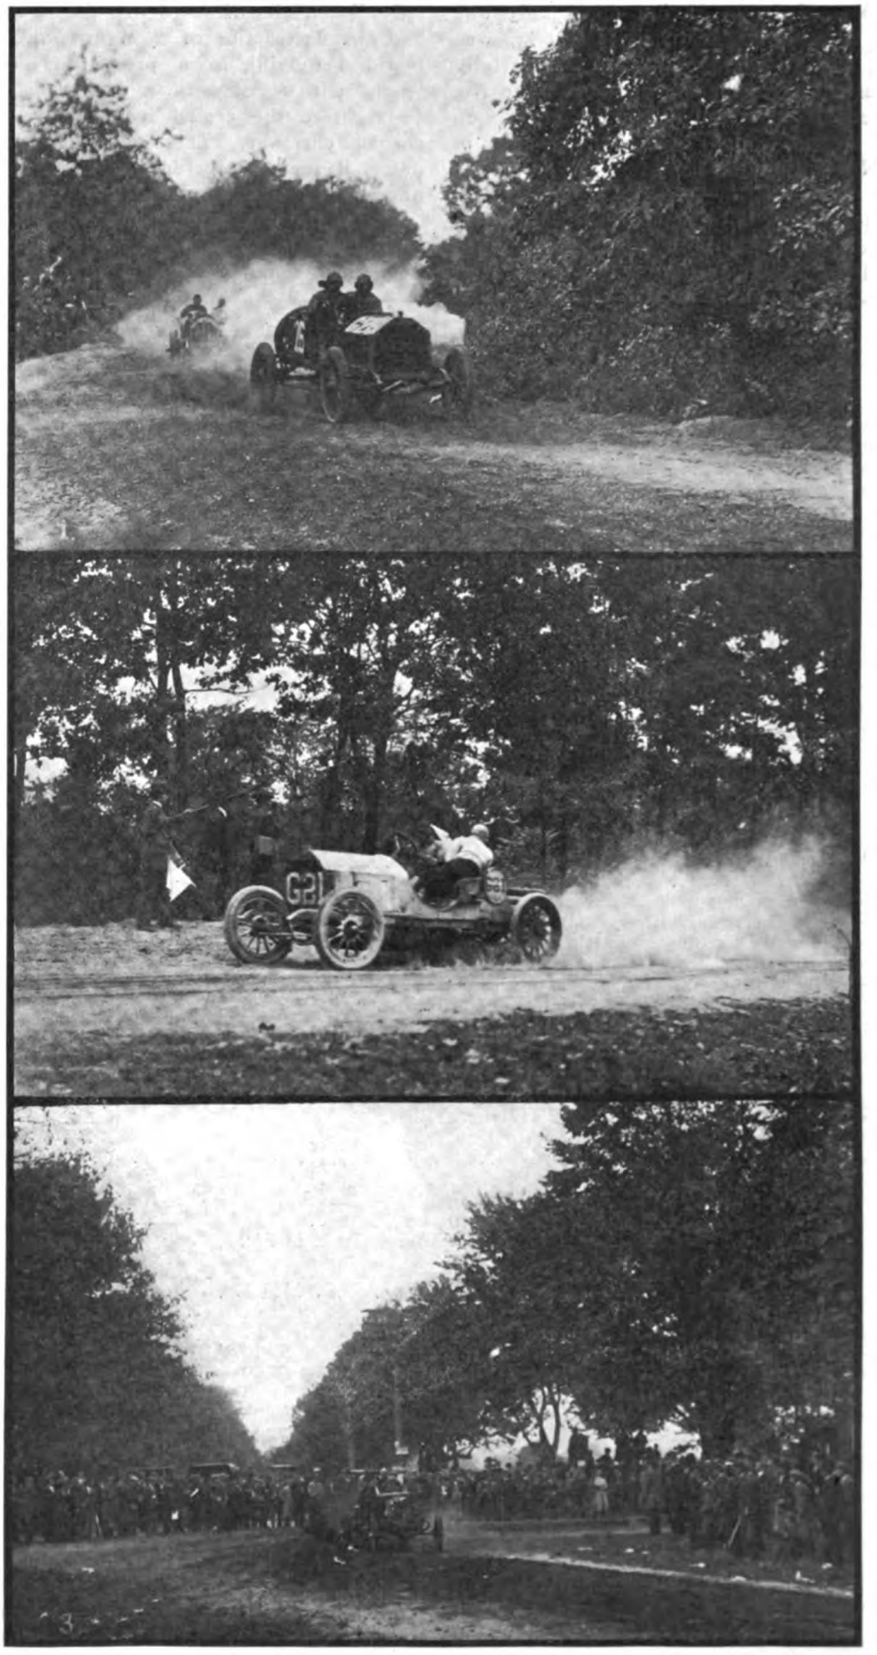
Bearing a big chronometer in its wooden box, one of the timers assisted Starter "Fred" Wagner, the latter counting off the last ten seconds to each driver, with a concluding slap on the back and a shout of "Go!" The formation enabled each car to come up promptly, so that there were no delays. In fact, some were a little too hasty in getting off, and "Wag" had to yell a furious "Come back" above the roar of the engines, while the moving picture men cranked away on the machines that they pointed at the scene.

It was predicted by many that the more powerful cars would arrive first, but the small No. 3 Buick, of the "N" class, was shortly seen skipping over the distant bridges and rounding into the home stretch all alone. It was cheered heartily. The No. 1 Mitchell, which had started first of all, next hove in sight, and was quickly followed by bigger cars in the other classes, after which the alphabet was badly jumbled, with "M," "G," "P," "N" and "J" cars coming by in mixed order.

As the race progressed it became evident that the placing of the supply pits directly in front of the grandstand was an excellent thing in centralizing the interest at that point, and giving spectators the opportunity of seeing one of the real features of an automobile race without having to go around the course on the chance of being at an individual supply station just at the time that a car comes in. The roadway in front of the stand is much wider than on the regular parkway, not only to allow plenty of room when machines that have stopped are standing at their respective sup-

FREE "GRANDSTAND" ON OVERHEAD BRIDGE

Digitized by Google



ply stations, but also to invite cars to pass each other there. By some strange freak, however, there were only two instances of such passages near the stand, and the difference in their class and speed robbed the incidents of any thrill. It was in the stopping of the cars, to replenish oil and fuel or to make repairs, that most entertainment was found.

Whenever a car stopped, the pits resembled a spirit cabinet when "Little Bright Eyes" waves a tambourine or other objects over the top, or mischievous "Joe, the Dwarf," tosses out slates, pads and guitars; for all that could be seen were the mysterious hands from the depths, reaching upward with tires, wrenches, fuel cans, and in one case even a cylinder. Only the driver and mechanic were allowed to work on a car, and snatching the supplies that would so magically appear, they would labor hard to get away again. At $100 and $200 apiece per race, the pits should make money for the Parkway.

Soft earth had been placed at the point where the cars halted, and as it began to loosen and get dusty, "Willie" K. Vanderbilt, Jefferson DeMont Thompson and other notables responsible for the Parkway took a hand at watering it down with hose, being "snapped" in the act by many cameras.

Meanwhile, Wagner with a green flag was informing some of the passing cars that it was their last lap, or with a checkerboard flag was calling off those who finished their distance. Chairman Thompson's prism binoculars were brought into requisition to pick out the cars as they appeared, so the right ones might be flagged. While suitable for this service, they were by no means powerful enough to enable Thompson to see Robert Lee Morrell, although the two gentlemen were in close proximity a number of times. Humerous complaint was made by the drivers that they could not tell Wagner's green flag from his flaring green handkerchief, but happily no serious confusion was caused by the similarity.

In the Nassau sweepstakes, the No. 3 Buick, driven by Easter, was the first to get the checkered flag for having finished the four laps, with F. F. Cameron's N. 4 Cameron in second place, and Olney's No. 1 Mitchell third. The winner's fastest lap for the 23.46 miles was 30:55. The 6-lap Jericho sweepstakes brought in Burns's No. 11 Chalmers-Detroit as the winner, with Ainslie's No. 16 Chalmers-Detroit in second position, and No. 18 Mitchell, driven by Zirbes, third. The No. 16 made the fastest lap in its class, in 24:57. Coming from Trenton, N. J., as an "unknown," the No. 28 Sharp Arrow, driven by its maker, W. H. Sharp, created great surprise by winning the 8-lap Garden City sweepstakes from better-known cars, making faster average time than the winner in the class above it. The best lap was 24:03. Second place was won by No. 27 Knox, with Bourque driving, while Miller's No. 21 Stoddard-Dayton landed third.

SKIDDING ON TURNS. 1, ROBERT BURMAN, BUICK. 2, ALBERT MILLER, STODDARD-DAYTON. 3, ARTHUR SEE, MAXWELL.

Between the Rainier, No. 32, owned by Mrs. Cuneo and driven by Disbrow, and the No. 35 Allen-Kingston there was a long battle, the latter finally proving victorious in the 9-lap Meadow Brook event, its fastest lap being 23:58. Hilliard's No. 34 Lancia was third. With one tire flat, Lytle finished early in the 10-lap Motor Parkway group,

Digitized by Google

his No. 42 Isotta having made only one stop, for fuel and oil. His fastest lap was 21:11 and his average 21:55—a wonderfully consistent performance. Strang in the No. 46 Renault was about 10 minutes lower, getting second, which Lechleiter brought in the No. 47 Itala third.

One of the Motor World's war correspondents labelled with a blue press badge wandered over to the "S" turn, half-only disaster he witnesed was the smashing and dire destruction of a "Manhattan" pool board, belonging to a prosperous-looking "gent" with a red necktie, who was trying to separate the crowd from their hard-earned currency. This refined gambling game, it seems, angered a citizen, who at once proceeded to demolish the layout.

As for the contestants, most of the cars, big and little, took these obtuse turns at very near maximum speed. There was

mers-Detroit "Bluebird" and numerous others would start to skid their rear wheels toward the outside when rounding the bend, but after swinging but a few inches from their course the inclined banking would hold them in proper balance and not permit the dangerous side-swipe that would occur on an ordinary road. Obviously the certain degree of roughness of the concrete surface gave the tires good traction, and did not allow them to slide in the same manner that

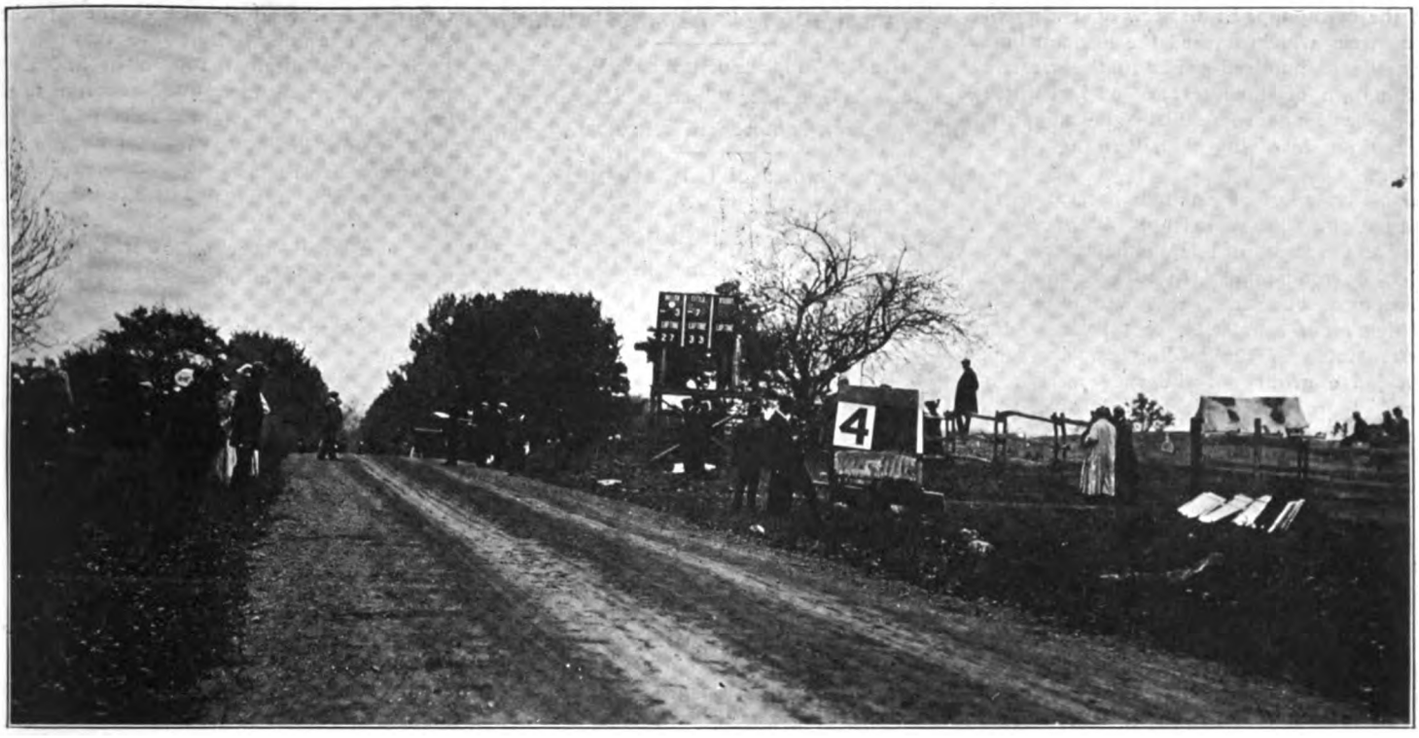
---

way between the grandstand and Westbury, in order to observe the happenings as the cars rounded the two curves on the cement course, which were reputed to be so dangerous. It had been rumored that the turns were not banked sufficiently to permit the cars to take them at high speed without upsetting, and, further, that the bridge grades were so abrupt as to cause the cars to jump dangerously as they passed them. Yet the



some skidding, of course, but many of the long wheel-base cars slewed less than the shorter ones—due, to a large extent, to more expert handling by some of the more experienced pilots, perhaps. While the banking of the turns is not as steep as might be expected, it was found to tell considerably on the equilibrium of the cars as soon as they would commence to skid. Kilpatrick's Hotchkiss, Lytle's Isotta, the Chal-

asphalt, greasy and otherwise, often does.

One remarkable phenomenon was observed. On many of the faster machines the front wheels would pound and bounce around the curves, making steering at high speed an operation requiring the best of drivers' skill. Instead of rolling along in the right manner, the speed of the car and the sway of the rear wheels would force the front ones to slide ahead and scrape along at an angle, despite the driver's efforts to aim them in the right direction. This, of course, was due to going at a rate that would upset such cars on ordinary roads.

The manner in which the various drivers hit these curves was interesting. Some would swoop away out on the upper rim, almost near enough to the edge to topple over, while the majority of the pack stuck to the

Digitized by Google

SIGNALING AT THE SUPPLY STATION ON THE JERICHO ROAD

center of the white path. Lytle, Lescault and others would go thundering around in the center, skidding more or less, and apparently careless of consequences, while Lewis Strang would stick to the inside pole on most laps and skid hardly an inch. A number of the small cars also hugged the inside, this keeping them out of the big fellows' way and shortening their journey a trifle.

This same "S" curve is well laid out and beautifully banked, but in one respect at least it is a disappointment. For those who looked toward it as the scene of possibly sensational developments it seems destined to be barren of spectacular elements.

It was pleasant to see that sturdy son of Long Island, whose barnyard was temporarily given over to the purposes of a roadside supply station, wandering over his domain. He was observed to smile as he thoughtfully kicked his toe into the ruts formed in the soft turf by the wheels of the cars and it seemed he must be ruminating on the relative profits derivable from tilling the soil and farming it out to the Long Island Motor Parkway to be in turn farmed out to the entrants in the race, in 10 by 12 foot sections at the rate of $50 per 120 square feet, or thereabouts.

He was not alone. In addition to its rightful lord that profitable spot was peopled by no less than 199 other persons, including attendants at the stands, the telephone men and "the crowd." Scattered along the course at ragged intervals were small groups of local residents with an occasional motoring party—another two or three hundred perhaps, within a range of a mile each way. The section thus outlined was what was vaguely known to the press men and spectators at the grandstand as "the other supply station."

Arrangements here made for the convenience of the drivers were neat if not gaudy. Within the yard in question, some 20 feet back from the road, was constructed a sort of counter of plain lumber, back of which were stretched partitions for some 12 feet, forming small enclosures of the stall order, in which the contestants' supplies were packed. The virgin turf of the yard formed a siding onto which the cars could run from the course, while laid up for replacements. A stand directly in front mounted the telephone station, while various signaling devices erected by their assistants for the guidance of drivers in the race completed the embellishment of that section of the course.

From the spectacular point of view, "the other supply station" was not a distinguished success. The road before it lies fairly straight and declining slightly in the direction of travel. Half a mile away to the

MAXWELL AND SHARP ARGUING THE COURSE

Digitized by Google

east the cars popped into view over a notch in the trees which marked the horizon line. A couple of hundred yards to the west, a combination of down grade and reverse curve occasioned some little side slipping, but nothing involving even thrilling consequences.

Also as a point of general observation of the race, the station was not advantageous, owing to the laxity of telephonic interchange with the grandstand. Up to 11 o'clock or thereabouts, bulletins were sent in with a fair degree of regularity, so that in so far as the status of the leading cars in each of the five groups of the race were concerned, there was no lack of information. The results as received, were chalked up on a small blackboard and promptly erased. Nothing was said of mishaps or delays, however, and the spectators were forced to do their own "clocking" in order to determine for themselves how matters fared with their favorites.

"Station stops" at the supply station began fairly early in the race. Mostly the cars were in need of supplies and tarried only a moment or two—the drivers and mechanics working feverishly while the attendants passed them what they required; or bungled things sadly in the madness of their haste. Thus:

Mitchell No. "N-1" stops for water and oil, and before leaving the mechanic ties a handkerchief over the radiator inlet in order to provide free ventilation. Cars No. 35 and 36 pass in order, both running prettily, and then the "J-18" Mitchell drops in for a supply of lubricant. Strang, whose Renault evinces an apparent tendency to switch its rear end slightly on the reverse curve just below, rumbles by presently, with the six-cylinder No. "44" car close behind. The Maxwell, No. "J-13" drops in presently, and its driver explains, while taking on fuel and oil, that his earlier rounds had been delayed because of water splashing from his radiator. This had short-circuited the current and necessitated a complete change of plugs before regular running could be got out of the car.

Only the few large cars are left in the running, now, and they pass and repass with such precision that there is small interest in their flight, save to those who have kept consistant scores of their own from the very first lap.

Lunch boxes are in evidence. Packages of pie and crullers are being unfolded here and there, while beside the road a constantly augmenting procession on foot is winding its way down toward the cross roads where cars and carriages are waiting for their occupants. Two big cars pass within three minutes of one another. Then a solitary driver rambles down the course at high speed.

"He's on his last lap," says one.

"No, the next to the last—he's got one more to go," says his companion.

But the question seems to have lost interest to the majority of those who yet remain.

DE PALMA "IT" AT PROVIDENCE

He Breaks Track Record and Wins Free-for-All—Race for "Specials" Develops Hot Contest and a Protest.

Before a crowd of fully 8,000 persons at Narragansett Park, Providence, R. I., on Saturday, October 10, Ralph De Palma, driving the Fiat Cyclone, broke the local track record for the mile, when he covered that distance in 52⅖ seconds. The best previous performance for the mile in that locality was 0:54. De Palma's time on Saturday was only 1⅖ seconds slower than his recent world's record of 0:51 flat, made at St. Paul, Minn., on September 5th.

The races at Providence were held under the auspices of the Rhode Island Automobile Club and barring two accidents, formed an interesting program, though rather monotonous in that eight of the ten events were at five miles distance.

Both accidents were due to a defect in the track near the three-quarter post. Joseph Wilcox, of Beverly, Mass., taking the turn in one of the events, was hurled into a ditch when his Cameron skidded and crashed into the rail fence. Wilcox sustained an injury to his spine as well as a nervous setback, but it is expected that he will recover.

In another race Arthur Lee, driving a Corbin car, was thrown out, fracturing his shoulder when his machine reared, turned turtle and pinned him beneath it.

The first event was for gasolene stock cars rating from 40.1 to 60 horsepower, and boasted but four entries. Grant, driving a Locomotive car, won easily, taking the lead at the start and increasing it throughout the five miles. L. S. Rogers's Welch took second, with a big lead over Cook's Stearns. Grant's time was 5:14⅘.

Oliver Light captured the next, which also was a 5 miles event, but for cars rated between 15.1 and 24 horsepower, driving his Chalmers-Detroit over the course in 6:48⅗. It was in the second round of this contest that Wilcox's Cameron car went over the bank, and James Meyers in his Ford, who was close behind, wrenched his machine by applying the emergency brakes, so that he was forced to withdraw. Edgecomb in a second Ford, took second place.

Following De Palma's trial, in which he skirted a mile in 0:52⅗, a special race for gasolene cars of unlimited power, was run in three heats. Grant and Capron fought a hot duel in the first heat, the latter taking it with a Pope-Hartford. The two cars finished only ⅕ second apart, after having run within 50 feet of one another the whole distance. In the second heat, which A. W. Merriam won, with a Welch, Arthur Lee came to grief. Grant and Capron again came together in the final and fought courageously, driving side by side all the way. Capron had the advantage in the stretches, but was outgeneraled at the turns by his antagonist, who finally won in 5:13⅗. It was due to some misapprehension as to the legitimacy of Grant's methods of handling these same turns, however, that Capron later entered a protest, claiming that racing rule 66 of the American Automobile Association code had been violated. The rule in question deals with passing on the track and it was claimed that Grant cut in to the pole unfairly more than once.

In the free-for-all De Palma, in the Fiat Cyclone, drove around and around Grant's Locomotive, making six miles to his five. J. Crafford, in another Fiat, was an "also drove." De Palma's fourth lap was covered in 0:52⅖, which was ⅖ second better than his exhibition trial. His fifth was finished three-quarters of a mile ahead of his nearest competitor, and continuing the running at high speed, out of sheer bravado, he lapped the Locomotive car before it finished.

This race was to have been the big competition feature of the afternoon, as L. F. N. Baldwin, a local driver, was expected to give De Palma a close competition. The former, however, disabled his car while practicing in the morning, which prevented his appearance, much to the crowd's disappointment. The summaries:

Five miles, stock steam cars—Won by F. W. Marriott, Stanley; second, W. R. Files, Stanley; third, A. C. Trimble, Stanley. Time, 5:28⅗.

Five miles, gasolene stock cars, 15.1 to 24 horsepower—Won by Oliver Light, Chalmers-Detroit; second, C. A. Edgecomb, Ford; third, James Meyers, Ford. Time, 6:48⅗.

Five miles, gasolene stock cars, 40.1 to 60 horsepower, prizes $75 and $40—Won by Grant, American Locomotive car,; second L. S. Rogers, Welch; third, C. Stafford, Stearns. Time, 5:14⅘.

One mile exhibition, against time—By Ralph De Palma in the Fiat Cyclone. Time 52⅗ (record for the track).

Five miles "Special," gasolene stock cars, all horsepowers—Final heat won by Grant, American Locomotive; second, H. A. Capron, Jr., Pope-Hartford; third, Stafford, Welch. Time, 5:13⅗.

Five miles, free-for-all—Won by Ralph De Palma, Fiat Cyclone; second, Grant, American Locomotive; third, Crafford, Fiat. Time, 4:26.

Five miles, motorcycles, 20 inches displacement—Won by B. A. Swenson, Indian, time, 6:35⅖; second, E. L. Buffington, Indian, time, 6:38.

Five miles, motorcycles, 30 inches displacement—Won by B. A. Swenson, Indian, time, 5:37⅖; second, J. McLaughlin, Merkel, time, 5:42⅕.

Five miles, motorcycles, 60 cubic inches displacement—Won by B. A. Swenson, Indian, time 5:28⅗; second, E. L. Buffington, Indian, time, 5:53⅗; third, J. McLaughlin.

One mile, motorcycle, exhibition, against time—By B. A. Swenson. Time, 1:02⅗.

BIG RACE AROUSES PHILADELPHIA

Robertson Wins $2,000 Cup in 200 Miles Contest—Thrilling Duels for Position—Mulford Makes Fastest Lap.

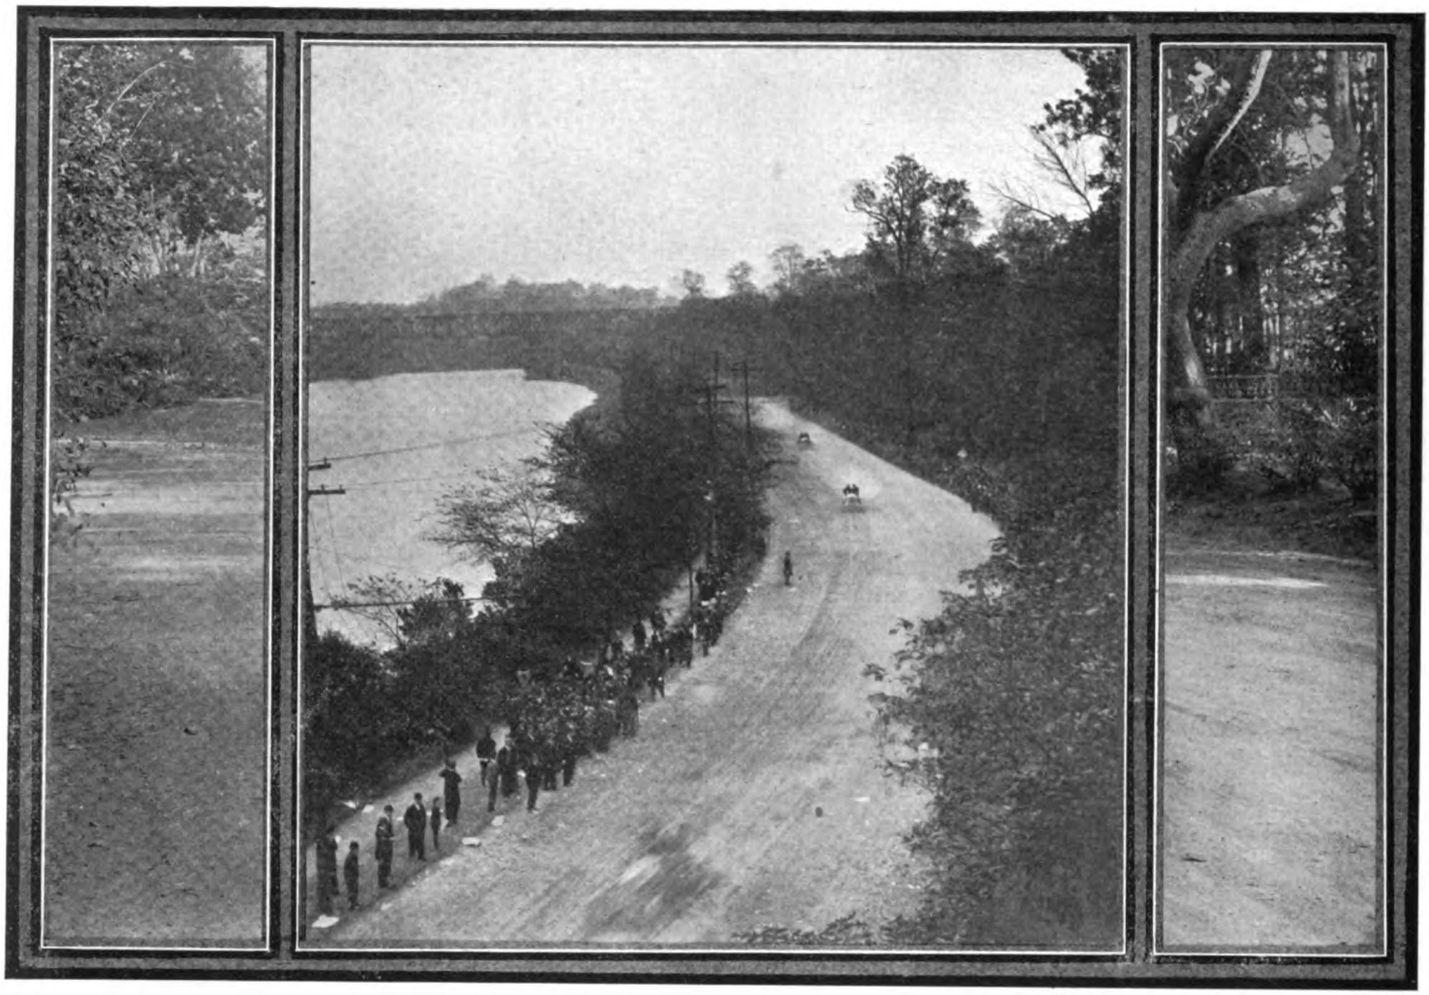
Quite the liveliest spectacle witnessed by staid old Philadelphia in all the dashing program of its Founders' Week was that furnished by the automobile race of Saturday last, 10th inst. Barring only the undignified squabble for seats in the grandstands lining the route of its elaborate historical pageant, no review was more exciting than that of the sixteen cars which flashed about the tortuous circuit in stately Fairmount Park, with remarkable precision and in an endless succession that suggested a flying parade of machines.

To cover the 200 miles of the course, it was necessary for the drivers to make 25 laps of eight miles each. Sixteen cars started, and one was eliminated after completing one round trip. Of the remainder four finished with honors, a fifth car being the only other one running when the race was called off by the officials. Throughout the contest the majority of the contestants kept close to an average of ten minutes to the lap, so that the spectators who lined the greensward by the side of the boulevards had never more than a moment or so of inaction. The first event of its kind for the Quaker City, it set a mark of popular esteem that will be hard to equal another time.

George Robertson, driving a 40 horsepower Locomobile, added fresh laurels to his crown by winning the contest and lifting the $2,000 cup. His time was 4 hours 2 minutes 30 seconds, and he made an average speed of nearly 50 miles an hour. This is Robertson's second victory within a week, and adds brave distinction to his conquest of the Brighton Beach 24 hours race on October 2 and 3.

In the Philadelphia race he beat his nearest competitor, Patchke, by more than 12 minutes. The latter, in the Acme, won second honors after a lively duel with Mulford's Lozier, in 4:14:54. Mulford, in addition to scoring third in 4:17:26, won the North American's cup for driving the fastest lap—his tenth. To accomplish this, he was forced to make a circuit of the course with its numerous dizzy turns in 8:32. Bert Maucher, with the Peerless entry, was fourth, in 4:21:26, the race being called off as soon as he had crossed the tape.

When the contest was flagged at this point, no less than 11 of the original contestants had been forced to drop out, owing to mishaps, although strange to say, despite the numerous accidents, none of the drivers suffered serious injuries.



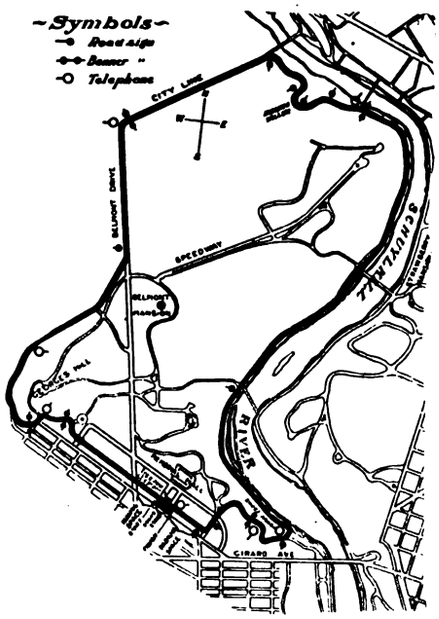
Promptly at 7 o'clock Herbert Bittner at the wheel of the Maxwell car, left the tape and started the race, a deafening siren whistle announcing that fact to the quarter of a million people reputed to be scattered about the course. The other contenders followed in regular succession, no incidents of an untoward character occurring to mar the start.

No sooner had the 16th and last car started than the cry of "Car coming!" went up, and George Davis's Apperson "Jackrabbit" leaped into view at the grandstand. He had passed Bitner's Maxwell, and was putting on high speed to retain the lead. Next appeared Maucher's Peerless and Salzman's Thomas; then a string of cars followed in such close succession that the

GEORGE ROBERTSON, LOCOMOBILE, "LIFTING THE CUP"

Digitized by Google

IN HOT PURSUIT ON THE BANKS OF THE SCHUYLKILL



timers could scarcely catch the numbers, let alone the exact times.

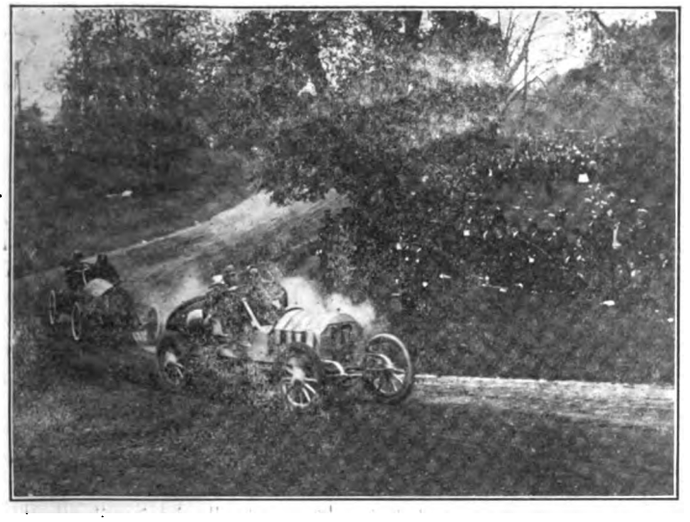
Salzman had forced the Thomas up close to the Jackrabbit and the Palmer & Singer was running in great form under Wallace's guidance. Following were Mulford, Robertson and Maucher, with the rest of the field drawing close together.

For a few minutes there was a lull at the grandstand and then news of the first accident was telephoned. While scarcely out on his second lap Harry Michener blew up a rear tire in making a very bad turn at Fifty-second street. A wild skid across the macadam road caused the car to upset, throwing out the driver and Harry Lynch, his mechanician, and breaking a wheel, which caused the car's early withdrawal. Michener and his mechanician were scarcely dragged from the road when Mulford, coming around in the sister car, skidded at the self-same spot, swerving wide and running off the course into the grass, but continuing on.

Salzman, who made the fastest time on the first lap—8:57—continued his high speed and was leading by a good margin in the second, with Maucher's Peerless, and Wallace in the P. & S. hot upon his trail. Florida's Locomobile was in fourth place and Davis's Jackrabbit fifth. Salzman retained his lead until the fourth round, when Wallace displaced him with a mad whirl.

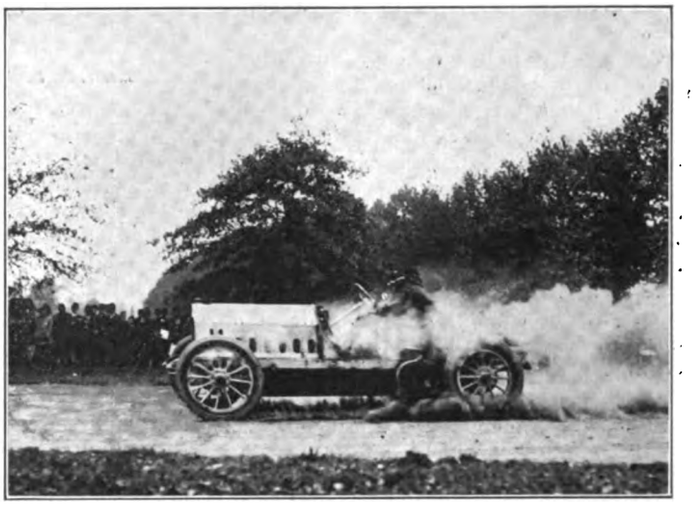
About this time the scouts around the course wired in that Bitner's Maxwell had

MAP OF FAIRMOUNT PARK COURSE



broken a crank shaft and would have to discontinue. With Wallace still holding the first position in the fifth lap, and with the other leaders in about the same order, it was learned that La Roche had been obliged to give up, his Pullman having been laid aside with a broken rear wheel.

Eliminations followed more rapidly after this. Robertson and Florida, the Locomobile team, had not been distinguishing themselves particularly up to this point, but seemed waiting on the order of events, and Wallace was still retaining his lead in the seventh lap, when the hoodoo sat on two more cars. Ireland was placed on the retired list, when the magneto on his Stoddard-Dayton went wrong, and Salzman's Thomas, one of the big favorites, was put down and out, with a broken crank shaft.



It was on the next circuit that Robertson made the people sit up and take mental note, when he stole fourth, with Florida sticking close behind and passed Wallace. Thereafter Robertson continued to hold his own and was not headed for the remaining two-thirds of the race, save only once by his team mate, and then only for one lap.

On the ninth, tenth and eleventh rounds, Davis pushed his Apperson with all his might and was no mean challenger, while

Digitized by Google

ROBERTSON, LOCOMOBILE, LEADING WALLACE, P. & S.

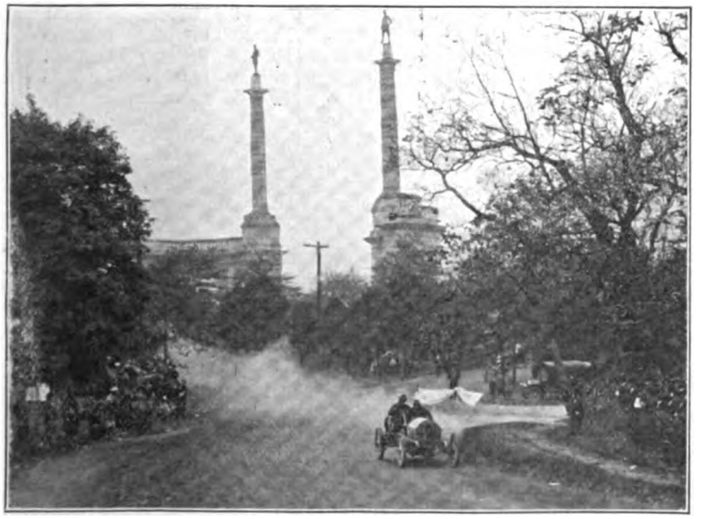
PATCHKE, ACME, WHO FINISHED SECOND

Wallace, in a desperate effort to regain his advantage, pressed the "Bunny" hard and held fourth position against the field. Swinging into the finish of the twelfth he tied with Davis for third place, only to lose it in the next whirl by a bare 2 seconds.

Zengle, who had been piloting the Pennsylvania in a fairly consistent manner, gave up the ghost soon afterward, and a few minutes later, Frank Yerger, whose Studebaker had been performing well, though not among the foremost, suffered a broken wheel at a sharp turn, ripping out the spokes completely. A new wheel was put on, but the delay spoiled his chances.

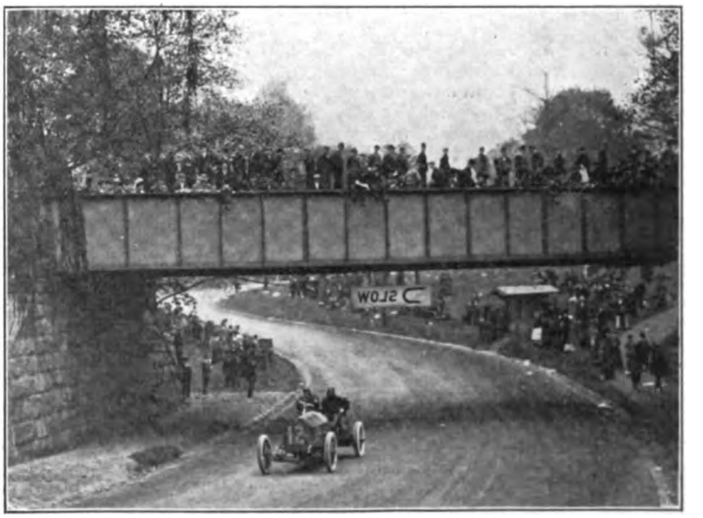
Robertson, who was leading the pack by four minutes and more, showed no let-up. Between the 14th and 15th laps, however, Wallace caught up with the other Locomobile driver and tied for second place, only to yield again in the 16th. In the 17th Florida had jumped past Robertson, and was leading him by 10 seconds at the end of the lap. He did not hold the advantage for Robertson soon went up to the lead again.

A remarkable incident of the 19th circuit occurred when seven cars were discovered to be on the same lap simultaneously, with but 8½ minutes between the leader and last car and but little more than 1 minute separating the leading trio. Indeed, for two entire laps, or until the 21st, the cars were in the same order. Then the "hoodoo" again appeared. Bergdoll in his Locomotive, anchored on Belmont avenue and went out of the running, and Wallace, who had driven such a splendid race, was forced to retire. George Davis's misfortune was every bit as tragic in the next lap, when his Jackrabbit fell. He had been speeding at a rate that endangered the two Loco drivers' chances considerably, and it was a hard blow.



In the mean time, Patchke, in his Acme, had been slowly but surely creeping to the fore. Davis's breakdown swung him into third place. Mulford followed. Bert Maucher, the Peerless driver, had been handicapped by tire troubles about this time to such an extent that he was unable to take advantage of these other mishaps.

The 23d lap proved James Florida's Waterloo and spoiled the second Locomobile's chances. His break down at this critical moment gave the Acme the place directly behind Robertson. Patchke set out for the leader, but the lead was too great for him to overcome. At the end of the 24th, Florida dropped out altogether and was not able to fight for a place at the finish.



The duel between Mulford and Maucher resulted in the Lozier driver getting away with third honors at the finish line.

Honor weighed heavily on Robertson's hands when he attempted to lift the cup he had won, amid a shower of roses scattered by the hand of the mayor's wife. He bore the ordeal well, however, and graciously accepted the recognition for which he has waited patiently since the accident of two years ago, when he was prevented from participating in the elimination race prior to the Vanderbilt cup contest in which he was determined to compete.

Robertson's victory was clean cut and decisive. The Fairmount course was by no means velvety, despite its parkway character. There were numerous nasty turns and at these the crowds were packed in shoals, watching for sensations. Many of the wiser

FLORIDA, LOCOMOBILE, CLEARING SHARP TURN

WALLACE, P. & S., ON "S" CURVES

Digitized by Google

ones even climbed trees to gain a better view.

Around the Falls of Schuylkill bridge, under which is the famous "dip," too narrow to permit the passage of two cars, the crowd was the thickest, and further along the line, on the "Hairpin" curve on Neil drive, another large crowd gathered. Between here and Belmont avenue the crowd was not so thick, but at Belmont dense throngs formed all along the drive to Parkside avenue.

Despite the huge attendance, little or no difficulty was experienced in handling the crowds. The arrangements for policing the course had been planned carefully in advance, and so far as could be learned, the drivers were at no time embarrassed by that press of humanity at the sides of the road which has hampered so many drivers in big events.

It was reported that prior to the race some of the drivers who had participated in the outlaw Brighton Beach 24 hours race of September 11 and 12, had refused to sign the certificates of absolution, thoughtful provision for which had been made by the American Automobile Association. Naturally drivers who were unwilling to take oath that in driving at Brighton Beach they had labored under a "misapprehension" in the matter of sanctions, would retain the technical disqualification which that act involved.

When interrogated as to the status of the Philadelphia race in this respect, Secretary Frederick H. Elliott, of the A. A. A., plead complete ignorance. Though refusing to be quoted he intimated that the Philadelphia club had not advised him of any such contingency, and indicated that were such the case, matters would certainly have to be straightened out before the running of the Vanderbilt cup contest two weeks hence.

Entries for the Vanderbilt Cup.

Announcement was made early this week of the complete list of entries for the Vanderbilt cup contest to be held on the 24th inst. Nineteen cars constitute the candidates for honors in the great classic and of this number, 12 are of American manufacture and 7 are foreign made. The drawing for starting positions took place yesterday (Wednesday) at the Garden City Hotel, with grand ceremony, under the direction of Fred J. Wagner. As a result the Locomobile car, the driver for which has not yet been nominated, will start first, followed by Basle's Knox, and Striker's Mercedes. The cars, drivers and order of start is as follows, the unlucky "13" being omitted:

No.	Entrant and Car.	Driver.
1	Locomobile Co., Locomobile.....	
2	Knox Automobile Co., Knox.....	Basle
3	Robert Graves, Mercedes	Stricker
4	Chadwick Auto Co., Chadwick....	Haupt
5	W. K. Vandelbilt, Mercedes....	Luttgen
6	Clifford V. Brokaw, Isotta	Lytle
7	James B. Ryall, Matheson	Ryall
8	E. R. Thomas Motor Co., Thomas..	
9	Hotchkiss Import Co., Hotchkiss..	Kilpatrick
10	H. P. Whitney, Brasier	Pouget
11	Acme Motor Car Co., Acme....	Patchke
12	E. R. Thomas Motor Co., Thomas..	Salzman
14	Thos. Williams, B. L. M.....	Williams
15	Matheson Motor Co., Matheson....	Chevrolet
16	Locomobile Co., Locomobile..	Robertson
17	Paul Lacroix, Renault	Strang
18	Foxhall Keene, Mercedes	Keene
19	E. R. Thomas Motor Co., Thomas..	G'll
20	Knox Automobile Co., Knox....	Bourque

Wm. K. Vanderbilt, Jr., expressed some reluctance about officiating as referee of the coming race, as he has entered a car. The other contestants overcame his scruples and unanimously voted him referee. The Mora car, which was entered some time ago will not be able to compete, as it will not be completed in season.

Old Buses for Traveling Show.

"What becomes of the old cars?" is a question frequently asked and not invariably answered to the complete satisfaction of the inquirer. But in France and England the problem of disposing of the old motor omnibuses cannot as readily be solved through the assistance of the rebuilder of second-hand material, as can that of disguising old cars. Nevertheless in a few instances new uses have been found for discarded vehicles which are as odd as some of the purposes to which old horsecars are sometimes devoted. Thus, in one case an enterprising showman has taken possession of a couple of old Parisian 'buses and converted them into a road train for his moving picture outfit. This, including tents, "bleachers" and stereopticon, is transported from place to place by the efforts of the two relics.

Shortest Route Determines Cabby's Fare.

Given the choice of a long and a short route, the driver of a taximeter cab cannot charge more for taking the long route, according to a London magistrate, who was called upon to decide a peculiar case involving this question. A woman called a cab to her house and the driver, apparently in order to swell his receipts, took a circuitous and mileage piling course. Upon the woman's refusal to pay the excessive taximeter charge, the driver applied for a summons for the amount, but was told by the court that if he chose to go the longest way he could not expect to be paid for it.

FIVE PERFECT IN FOUR DAYS TEST

Only Four of Seventeen Drop Out of Chicago Reliability Runs—Rain and Mud Mutilate Scores.

Few endurance contests can begin to compare with the 1,000 miles, four days reliability run of the Chicago Motor Club held on October 6-9. It was almost as big an event for Chicago as the sweepstakes for New York, or the Fairmount races for Philadelphia. Seventeen contestants started out on the schedule which comprised an average run of 250 miles daily in the vicinity of Chicago, returning to that city each evening; and when the technical committee made its final report of the four days, only five of the starters were found to have perfect scores. Four had dropped out of the race at various stages and eight finished in the running with penalizations. The test was unusually strenuous and exacting. A perfect score meant that the cars had to be in absolutely perfect condition at the finish. As is usual with Chicago endurance contests, a loosened nut or bolt, a bent axle, or any other minor or major defection, caused a penalization. Two Haynes, a Premier, Franklin and Pierce-Arrow were fortunate enough to pass the eagle-eyed examiners at the final inspection. The following is the final score of the cars:

Perfect scores—Roadster Class.

Driver.	H.P.	Car.
Frank Nutt	36	Haynes
R. McNamara	32	Premier
C. S. Carris	28	Franklin

Perfect Scores—Touring Class.

L. Wagoner	36	Haynes
P. Hofman	60	Pierce Arrow Six

Penalizations—Roadster Class.

			Points
A. Kumpf	43	Pierce Arrow	1
McLain	30	Apperson	32
Dusenbury	20	Mason	216
Heaslet	45	Rainier	*
Nicholson	32	Midland	*
Halliday	21	Reliable Day.	*

Pen lizations—Touring Class.

Shafer	50	Marmon	2
F. Harn	20	Mason	2
W. Leitch	30	White	21
Muntwyler	20	Maxwell	51
Hal Sheridan	30	White	55
Smithson	27	Studebaker	*

* Withdrawn

In addition to the two general divisions, roadster and touring, the cars were sub-divided into price classes. F. Harn's Mason was first in the $1,000 to $1,999 class, with 2 points against it. McLain's Apperson won the $2,000 to $2,499 class, with a 32-point penalty; Frank Nutt, with the Haynes, and R. McNamara, in the Premier, both perfect scores, tied in the $2,500 up group; Muntwyler's Maxwell, with 51 points against it, led in the $1,999 and under; C. S. Carris's Franklin and Wagoner's Haynes tied with clean tallies for the $2,500 to $3,999 honors, while P. Hoffman, in his Pierce Arrow got away with the $5,000 up class.

The fuel consumption scores were calculated by a formula which took into consideration the weight of the car, the load and the total gasolene used on the four days of the run. The result was called pound mileage and embraced the number of pounds driven a mile by one ounce of gasolene.

The fuel consumption report was as follows:

No. and Car.	Weight.	Gals.	Pounds mil'ge.
9 Premier	3,585	69¼	224.1
15 Franklin	3,675	84¾	198.0
8 Haynes	3,675	84¾	198.0
20 Pierce Arrow	5,575	128½	187.5
16 Haynes	....	93⅞	184.5
19 Marmon	5,060	110	183.5
2 Maxwell	2.950	74⅛	171.3
4 Mason	2,735	69¾	170.0
7 Pierce Arrow	4,280	110	169.5
11 Rainier	3,865	106¾	156.7
14 White	4,630	145⅜	134.5
12 White	4,765	153	134.5
3 Mason	2,615	87⅜	119.0

Of the seventeen contesting starters thirteen were perfect when the caravan checked in at Chicago Tuesday night at the end of the first day. The only driver to suffer penalization on account of the storm was Barney Muntwyler, driving the Maxwell entry, who suffered from carburetter trouble which caused him to lose 24 points.

George Smithson's Studebaker was in trouble when Janesville was reached, with a crippled rear axle. Failing to return to Chicago on time that night, it was declared out of the contest. F. S. Dusenbery, piloting one of the Mason cars, found it necessary to break seals and fuss with an oiler on the road. W. Leitch in the White Steamer narrowly averted a tragedy with a railroad train at a Janesville crossing. The car barely cleared the track without being hit, the three passengers jumping for life.

C. L. Halliday's Reliable Dayton (the only buggy-type car inthe contest) fared well until the last part of the drive, lateness in reaching the night control causing it to lose a perfect score.

The second day's jaunt saw a couple more broken scores, the heavy roads making extremely hard going. Contestants set out at 4 a. m. in the pitchy darkness and watched the chill gray dawn break as they swung out through Aurora, Big Rock, Somonauk, Ottawa, Lowell, Oswego, and back after a hard push to Aurora, whence they returned to the starting line at Jackson Boulevard and Michigan Avenue, Chicago.

It was the bad highways around Semonauk, Ill., that despoiled the two scores mentioned. Hayes's Midland went flying into a patch of cinders and was wrecked, when a front wheel stuck in a rut and caused it to slew into a ditch. A front axle was broken, necessitating withdrawal, and G. P. Hall, the observer, was thrown out against a fence and sustained an injured knee cap. The Rainier that Heaslet was piloting suffered a broken frame and was withdrawn, though it was continued as a non-contestant, along with the Reliable-Dayton motor buggy. Dusenbury's Mason had two more points checked against it, for stalling the motor while in one of the controls, making a total penalization of 68 points.

When the technical committee made its report, at the close of the day, just a dozen of the 17 contestants still retained clean slates.

On the third day another car was dropped from the honor roll. The spin into the State of Indiana resulted in Nelson McLain, driving the Apperson entry, being penalized 22 points for breaking the seals on his hood to repair a fan-belt. The only other demerits which the technical committee imposed, were upon Dusenbury's Mason, which lost points earlier in the race. A couple of accidents varied the monotony of this day's run, although no one was injured. Paul Hoffman's Glidden Tour Pierce Arrow car "mixed it up" with a South Bend trolley car, while upon the return trip through South Chicago George Smithson's non-contesting Studebaker smashed a wheel and skidded badly.

Then came the wind-up day—the last 240 miles of the long contest, through a none too smooth route, touching Elgin, Rockford, Oregon, Rochelle and Aurora. When the last car checked in at the finish nine cars were reported with perfect scores, although these, of course, were subject later to minute examination by the technical committee.

Hal Sheridan, the crack White Steamer driver, was the unfortunate on this last leg. Before starting out in the morning he located trouble with the chain and oiler belt. In adjusting the difficulty, however, he was obliged to touch the seals, which cost him a penalization of 12 points, plus 14 for work on the road.

The tired technical committee wrangled for half the night in an effort to determine the winner of the Standard Oil Company trophy, offered for the car which was able to make the 1,000 miles on the least gasolene. Several likely winners of this philanthropic prize of the big-hearted corporation loomed up, but the mathematicians and experts adjourned this task until later. Their final conclusion resulted in the score quoted above.

Carries His Show on Motor Cars.

Lucky in having a circuit of theatres under his own exclusive management, all grouped on Long Island in towns within easy distance of each other, Al. Trahern, who is called the Long Island Frohman, has decided to use motor cars instead of the railway for transporting his troupe and scenery on their route of one-a-week shows. He has ordered a 32-passenger machine for the players and musicians, and a large freight truck for the baggage. The splendid condition of the Long Island roads makes the entire success of the plan more than probable.

OLDFIELD AND CHRISTIE PERFORM

With Soules as Buffer They Share Honors at Cleveland's Two Days Meet—Kelsey's Entry is "Copped."

That trio of so-called "dare-devils," which has been delighting the visitors at Western county fairs and other small race meets for the last few weeks, entertained a goodly crowd at Cleveland, Ohio, during the Cleveland Automobile Club's two days' meet at the Glenville track, on Friday and Saturday, October 9-10. The "trio"—that is to say, Barney Oldfield, Walter Christie and Charles Soules, who seem to have the win-as-they-please habit—also exhibited as a fellow attraction R. G. Kelsey, of New York City, a driver who is better known in the East than on the Western tracks. Kelsey's efforts were curtailed, however. For some small question as to the rightful ownership of the car he was driving, which was claimed by a Chicago automobile company, proved his undoing. After some dispute over his title to the machine, he was placed under arrest on the broad charge of having stolen it, and his name was erased from the program.

Oldfield and Christie shared such "honors" as were to be had. On Friday the latter traveled a mile in 0:55½, which is nine-tenths of a second slower time than Oldfield once made on this self-same track. That hero himself shot around in his six-cylinder Stearns in 0:57 7-10, while Charles Soules, in the smaller Stearns, was one and one-tenth seconds behind that mark. The smaller Christie machine did not get under the minute mark, and its best time was chalked up as 1:04 2-10. This car was not working right at any time during theday, as is frequently its wont.

Oldfield also made the best time in the semi-final heat of the sweepstakes, when, going against Christie, he made the three miles in 3 minutes flat.

Paxon in a Jackson came in first in the $3,500 and under class for stock cars, doing the two miles in 2:31, but because this car was stripped of its fenders it was disqualified and the race given to Hissong, who drove a Winton in 3:58 4-5. The entry blanks allowed machines to be stripped in this manner, but as none of the rest had done so it was decided not to count the time made by the Jackson.. This novel way of making decisions did not make the Paxon-Jackson outfit a warm champion of the judges. Paxson also captured the novelty race and repeated in the two-mile special event for touring cars and runabouts, making the course in 2:41 9-10.

In the novelty affair, in which the drivers of novelty touring cars picked up and discharged a load of passengers every other mile for five miles, some of the machines did not slow up, and many of the passengers were rolled in the dust of the track in front of the grand stand, to the intense delight of the spectators.

Saturday, the second day of the meet, saw the clay surface of the track in very slippery condition, due to rain, and the fast drivers did not care to take any chances. When it came to the final of the sweepstakes event, however, Walter Christie shot under the wire ahead of Oldfield, his time for the pair of miles being 2:12. In an exhibition against time he also distinguished himself by making a mile in 0:59 4-5, which by no means equalled his previous day's mark.

Fireworks served to enliven the three-mile race for the $3,500 class. Paxon's mount caught fire and Frank Arams's Mora followed suit, but the flames were extinguished before either of the cars was badly damaged. U. Osgood, driving a Stoddard Dayton, won in 3:32 1-5, with the Arams's Mora second.

The three-mile free-for-all handicap again furnished excitement for the spectators. Charles Soules's four-cylinder Stearns was the scratch car, the Stoddard-Dayton and Mora were given twenty seconds handicap and two Oldsmobiles and a Royal were given considerable more, and in consequence Soules had some difficulty in winning the event. This he did, however, in 3:18 4-5. Frank Adams got away with a two-mile event for 1909 models, showing the field his dust in 2:34 1-5.

Detroit Plans Triple Endurance Contest.

What is billed as the "second great endurance run" of the Detroit Automobile Dealers Association is to take place on November 5, 6 and 7. Three separate runs will be made on each of those dates, the contestants starting early in the morning from Detroit and returning at night. The first day's trip will be to Saginaw and return; the second to Adrian and Jackson and return; and the third to Lansing and back. The schedule will be far more severe than in the last contest held there, and it has been decided to divide the cars into three classes, the smaller ones to start earlier and run on a slower schedule. At the finish, a technical committee will make a special examination of each machine, deducting points for deteriorated and broken parts of the mechanism.

Desert Course for a Road Race.

An Arizona newspaper has offered a silver cup as an inducement to motorists in that section to compete in a 450 miles road race from Los Angeles, Cal., to Phoenix, Ariz., which is being agitated by the Maricopa Automobile Club. It will take place between November 1 and 16, to reach Phoenix during the Territorial fair. Following the road race, there will be a track meet at the latter city. Much of the proposed course is through sand in the desert, which is calculated to test severely the running quality of the cars.

VIRGINIANS TAKE TO MOTOR RACES

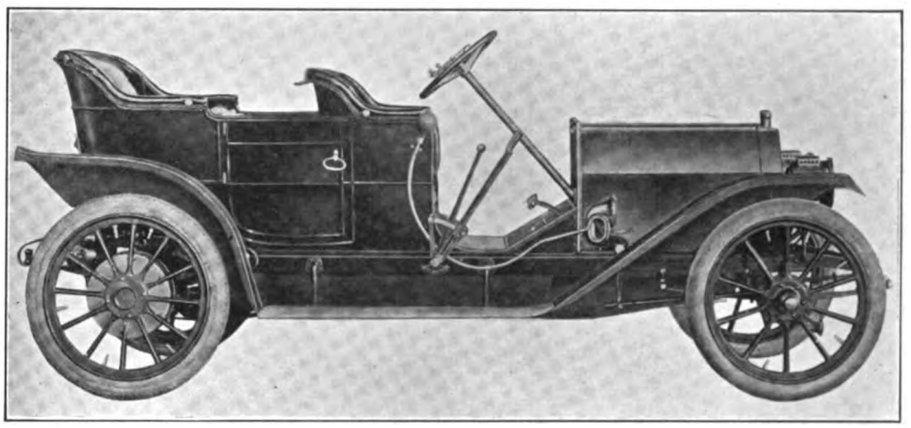
Six Contests Make Exciting Close for Their State Fair—Ray's Plucky Fight Against Persistent Misfortune.

After the judges of the Virginia State Fair at Richmond had awarded the various prizes for agriculture, horticulture and health culture on Saturday afternoon, 10th inst., they went out to judge a series of six automobile and motorcycle races, five of which were at 10 miles' distance. After a motorcycle curtain-raiser, a 10-mile race for runabouts of 24-horsepower or under was held. Everts, driving a Buick, soon overhauled the field and won the event in 16:55½, with C. G. Montgomery in a Franklin and W. M. Batten in a Ford trailing for second and third places.

L. H. DeGraaf scored with a six-cylinder Ford in the event for cars between 24 and 40 horsepower. The only other entry was a Buick, which was outclassed. In the succeeding race for stock cars costing $2,500 and under, a Chalmers-Detroit, driven by E. J. Ray, led the field from start to finish, twice lapping B. A. Blenner's White Steamer and hauling rapidly away from the Foster Buick. Ray's time at the tape was 15:16, with the Buick second.

The scheduled feature of the meet was a 50-mile affair for chassis of 60-horsepower and under. E. J. Ray was mounted on a Stevens-Duryea "six," which broke down twice and was repaired each time. The Foster Motor Car Company's Buick and Dr. L. T. Price's car of the same make had a duel of their own most of the way. In consequence the former secured the lead and was holding it well when Ray, who had repaired his first breakdown, came along, overhauled the leaders one by one, and was in a fair way to win, when he broke down once more. The second accident ruined his chances for the cup, but Ray stayed in the race and swept around the track at a fast clip. The Maxwell touring car covered only about thirty miles of the race. The two Buick drivers finished first and second, the time being 1:11:44.

Lowell Holds "Pony" Automobile Races.



Since its famous Labor Day road race, Lowell, Mass., has been having a series of "pony" automobile races with boy competitors, in which the machines bear at least external similarities to the big racing cars and are designated by fanciful parodies in names. Among the entrants, the "L. I. A. R.," the "Iswotta," the "Knocks," the "Packhard," etc., are conspicuous, and as older citizens have in nearly each case put up substantial cash prizes, the competition has been very keen. At the most recent event, there were 17 starters, 11 finishers, and a crowd of over 1,000 spectators. Several of the machines overturned.

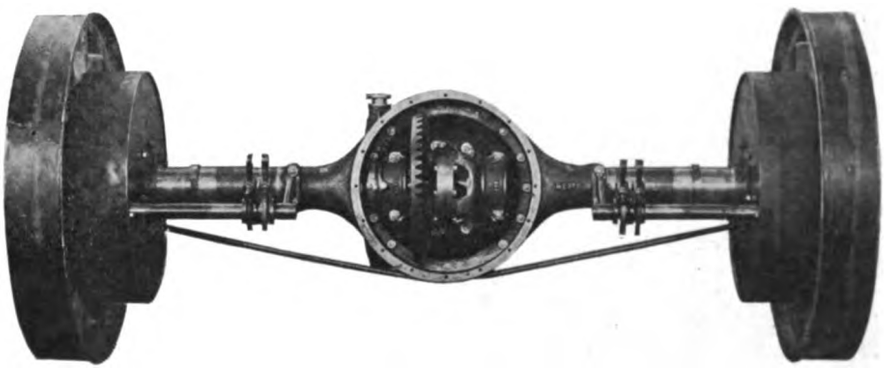
MARMON UNVEILS NEW MODELS

Distinguishing Features of the 1909 Designs —Originality Shown in Important Details of Construction.

Two entirely new models to be known respectively as the "Thirty-two" and "Fifty," are to comprise the principal features of the 1909 offering of the Nordyke & Marmon Co., Indianapolis, Ind., in addition to which there is to be a "45" roadster, differing from the larger of the two touring cars in the matter of engine dimensions and so of power. This announcement made last week, was emphasized by the simultaneous appearance of the two cars at the New York show of the National Carriage Dealers' Protective Association, where they were displayed for the first time, as told in the Motor World. While similar in many respects, they yet reveal sundry distinguishments which entitle them to entirely separate consideration. These differences extend not only to matters of dimension, but also to such elements of design as the transmission mechanism, the suspension and the general external arrangement of the vehicles.

MARMON "THIRTY-TWO"



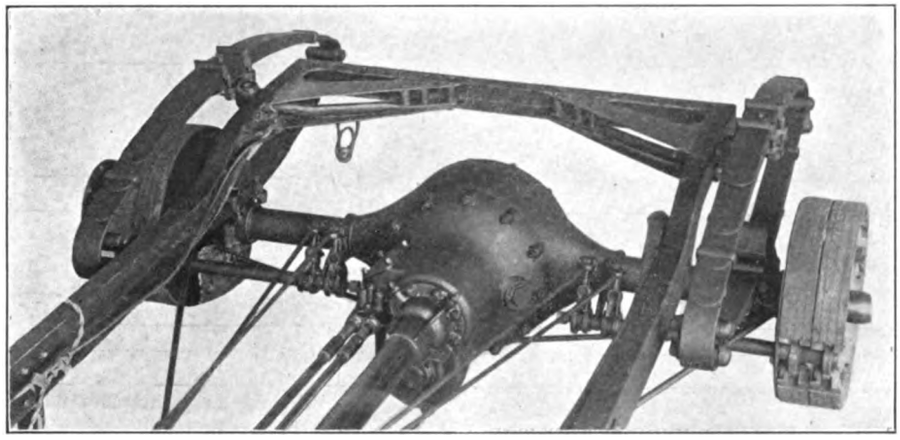
MARMON "FIFTY"

Thus Model "Thirty-two" is a low-hung, racy car with low-backed seats and somewhat the aspect of the popular roadster type, while its larger sister car is of generally heavier and more luxurious construction. The former, which mounts the new motor, recently described in these columns, has a transmission of the so-called "unit type," that is to say, mounted integrally with the rear axle and differential housing. The Model "Fifty," on the other hand, has the unit power plant which was employed on the models introduced for 1908 consumption, a straight line propeller shaft, and floating axle construction, which is at once unique and interesting to examine.

Contrasting the specifications of the two types for the sake of comparison, Model "Thirty-Two" has these features: Motor dimensions, 4½ inches bore by 4¼ inches stroke, rated output 32-40 horsepower; transmission, expanding ring master clutch, three-speed axle-mounted gearset, and floating axle; brakes, double expanding, placed side by side and equalized; wheel base, 112 inches; wheels 34 inches diameter; tires, 3½ inches; spring, full elliptical behind, 40 by 2 inches; front, semi-elliptical, 30 by 2 inches. Model "Fifty" is distinguished by a 5⅜ by 5-inch motor, multiple disc clutch, three-speed gearset, unit suspension of the power plant, floating axle drive, double expanding brakes, wheel base 118 inches, wheels, 36 inches in diameter, shod with 4 and 5-inch tires, front and rear. In both types, the frame is of pressed steel, the front axles, of I-beam section, the load being carried by ball thrust bearings, and the wheels carried on conical roller bearings.

As will be observed, a prominent distinguishing feature between the two types is the arrangement of the transmission mechanism. This is clearly brought out by the accompanying illustrations which show the rear axle construction in each case, as well as the brake mounting of the smaller car. This is the same in principle on both machines, the brakes being placed side by side in wide faced drums of unusually large diameter, heavily made and securely mounted on the wheels. The shoes are expanded through linkage balanced by means of equalizing beams, and are actuated by the usual pedal and lever movements.

From the illustration of the Model "Thirty-two" brake assembly, the novel method of adjustment will be observed. Instead of being permanently attached to the rocker arms which apply the shoes, the drag links are bolted to short arms which are loosely mounted on the rocker shafts, and carrying short worms having squared ends for the attachment of an adjusting key as required. The rocker shafts carry small worm segments into which the worms mesh, thus fixing the two together, but permitting a ready means of adjustment at any time. The alteration of the brake tension thus may be made without loosening any nuts or bolts, and by the instant use of a suitable key or socket wrench.



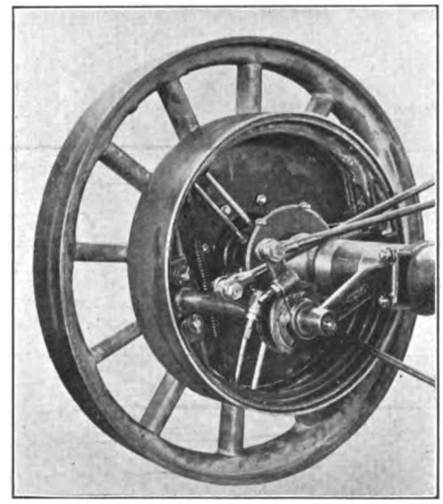
REAR AXLE SHOWING ASSEMBLY OF THE DIFFERENTIAL

The mounting of the rear end of the chas-

Digitized by Google

sis of this model also is noteworthy, not alone because of the substantial manner in which the springs are hung, but also because of the use of diagonal braces of trussed section employed in strengthening the rear corners of the frame. The illustration shows the complete chassis at this section, also revealing the manner in which the change gear group is incorporated into the axle construction. This general principle has been used before, but the design in question is original with this vehicle.

An orginal and distinctly novel feature of this assemblage is the method of mounting the wheels. These are carried by one large annular bearing, placed nearly under the load center, while the driving stubs are flanged at the outer end and bolted directly to the hub. This gives the essential action of the more familiar hub cap drive, but lacks its uncertainty in the event of a disordered hub, since it is practically impossible for the wheel to come off without giving ample warning. This arrangement also



MARMON "THIRTY-TWO" SUSPENSION AND TRANSMISSION

The mechanism is selective in principle, the lay shaft lying below the main driving elements. The arrangement is so contrived that the entire aggregation may be removed from the housing without dismounting anything further than the cover plates at the top and rear end, while the spherical form employed is calculated to give strength with a minimum use of metal. Surprising though it may seem, this construction adds less than 20 pounds to the weight of the complete axle—which serves as an effective answer to one of the arguments commonly advanced against this system.

In the larger car, the multiple disc clutch has 9 steel plates and 10 of bronze, with cork inserts, the whole being enclosed in a casing positively atached to the fly wheel. The gearset is mounted entirely on annular ball bearings, as is that of the smaller machine, and is so contrived that no gears are in action while the direct drive is engaged.

The massive construction of the rear axle equipment of this machine is shown in the illustration, which also shows the method of actuating the brakes. These are of 2-inch face and 17 inches diameter, as against 2-inch face and 14 inches diameter on the other car. They are actuated by means of expanding cams, worked by direct linkage, and are held out of action by heavy springs, which draw them against adjustable stops. The differential and bevel driving group is so constructed that it can be removed from the rear of the casing when the cover plate has been taken down, so that access to any of the parts may be had with but small expenditure of time and labor.

permits an unusual wheel design, since the axle attachment affords a very large hub, without overhang and presenting a practically flat surface on the outer and exposed side. The greater part of the load is carried by the single bearing, as stated. The steadying effect necessary to preserve align-

EMERGENCY BRAKE CONSTRUCTION

ment, is supplied by the outboard differential bearing in each case, the long leverage of the driving stub itself, serving to reduce the pressure to a relatively small and easily compensated amount at the center of the axle.

With the exception of these features, the design of both models is much in line with the ordinary practice of the day. Both have a road clearance of 10 inches, but are designed to give a low-hung effect which is deceptive in that respect as well as convenient. In the "Fifty" car, the cast metal body, which has been a Marmon feature in past seasons, is continued. The smaller car, however, is equipped with a sheet metal body.

Keeping Enclosed Brakes Clear of Grit.

Although the modern types of internal expanding rear wheel brake are so contrived that they are well protected from dust and dirt, it by no means follows that they do not require cleaning or that they are not apt to suffer from the effects of continued service under ordinary road conditions. The very fact that the brakes are enclosed makes it practically impossible for any dirt which may work into the drums to work out again under its own impetus. The result is that after a time a certain amount of finely pulverized grit will be found in the casing where it acts as a powerful and destructive abrasive. On this account the cover plates of all brake housings should be removed occasionally and the interiors thoroughly flushed out with gasolene.

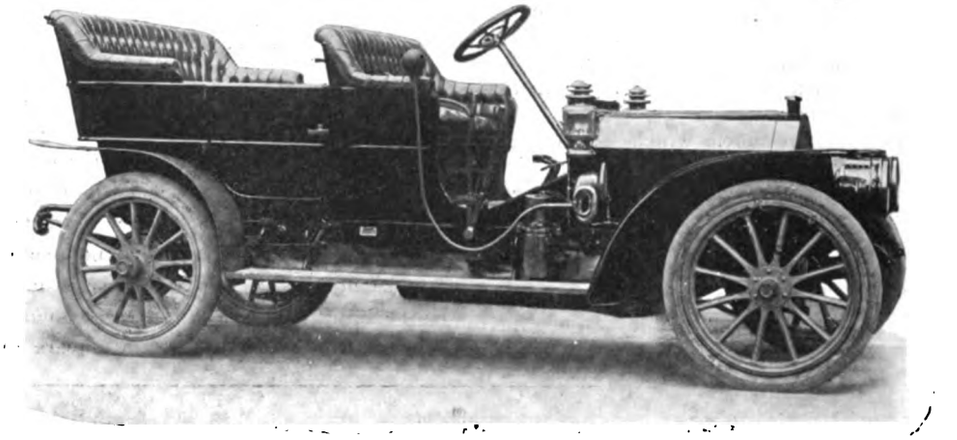
Testing the Movement of the Wheels.

When inspecting the mechanism of the car it is well to jack up each of the rear wheels in turn in order to observe whether they revolve freely. When there is an appreciable amount of resistance to motion the fault may lie with the dragging of the brakes, with the differential mechanism or with the rear portion of the transmission. In either case the cause of the difficulty may be traced out readily. If the resistance is noticeable on one side only, the remedy is usually obvious and may be applied at once. Otherwise it may be more difficult to sift it out, though none the less important.

Closing Leaky Gaskets in Couplings.

Leaking gaskets in flanged couplings of the exhaust piping may sometimes be closed by merely calking the asbestos filler with a thin, flat chisel or screw driver. More often, however, it is necessary to break the joint and replace the gasket with a new one. In doing this, care must be observed in order to draw up both flanges uniformly. Otherwise, the unequal pressure on the two sides will be a stimulus to further leakage. Obviously the proper joint can be made only when the two sections of piping are perfectly in line.

To Avoid Danger in Cranking.



Because of the danger when cranking, it is important that the connections between the timer and the hand lever be examined occasionally to see that there is no danger of the former getting adrift. In case this should occur the spark remaining advanced despite the location of the lever in the retard position would be apt to cause serious trouble.

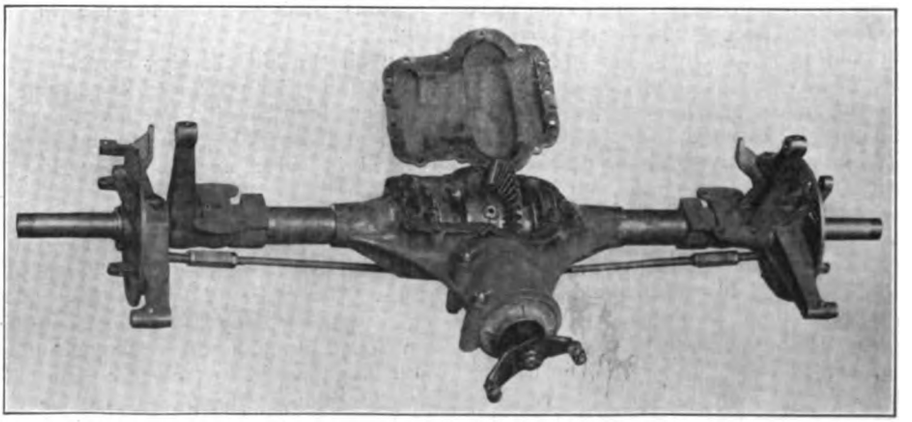
COLUMBIA IN TWO NEW MODELS

Mark "XLVIII-3" a Modification of Earlier Light Touring Car—Mark "LXX" an Electric Vehicle.

During the tenure in office of Messrs. Halsey M. Barrett and Henry W. Nuckols, receivers of the Electric Vehicle Co., Hartford, Conn., but little has been heard of manufacturing activities at the big plant which for so long has been identified with the name Columbia as applied to motor vehicles. Nevertheless, considerable has been accomplished in the way of clearing up the models which were already under way, and latterly in the production of a couple of new types, one of gasolene and the other of electric propulsion. Of these, the former is to be known as Mark "XLVIII-3", and is to follow in general the design of the former light touring model which thus is carried over practically into its fourth year. The electric vehicle now being produced is known as "Mark LXX," and is of the popular Victoria-Phaeton pattern. In both instances, work has progressed to a point where the machines are in readiness to be placed upon the market, and are in the actual stages of production.



COLUMBIA MARK "XLVIII-3"

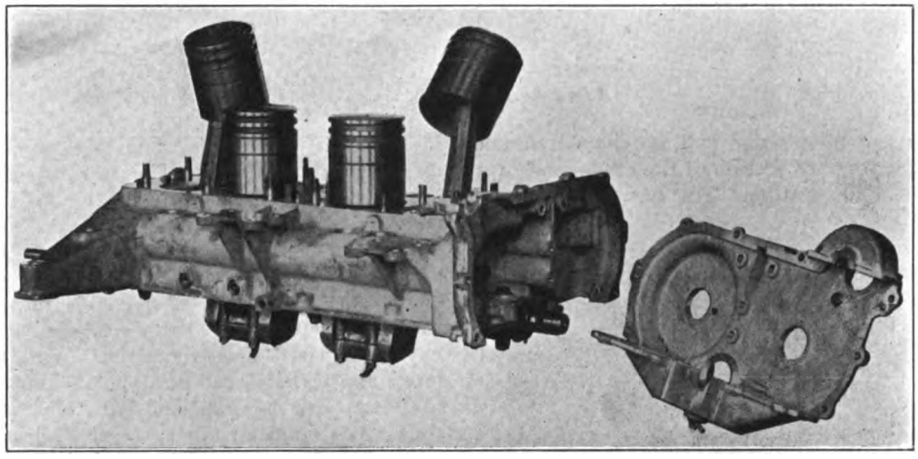
COLUMBIA MARK "XLVIII-3" CHASSIS

As indicated, "Mark XLVIII-3" already is familiar in its general aspects. As illustrated, it embodies these specifications: Motor, 4¼ by 4½ inches, bore and stroke; transmission by leather-faced cone clutch, selective sliding gearset, affording direct drive on high, propeller shaft and live rear axle; wheels and tires, 34 by 3½ and 34 by 4 inches; wheel base, 115 inches; tread, 56 inches.

The motor has cylinders formed in paired castings with the valves all on one side. An unusual feature of its construction is the use of non-interchangeable valves, the inlets being of 2¼ inches, and the exhausts 1 13-16 inches diameter. The power rating in accordance with the usual formula is 29 horsepower, or a trifle under. The construction of the crankcase, which is here illustrated, has been modified in the latest patterns to permit the adoption of a support for the valve and megneto shafts outside the gears. This is accomplished by the use of annular ball bearings mounted in the forward section of the case—as shown in the illustration. The gears are now of the spiral type with faces of increased width, making for longer life, reduced wear and more silent operation.

COLUMBIA MARK "XLVIII-3" REAR AXLE

Ignition is of the low tension, make and break type, the Bosch instrument now being employed to generate the current. The igniter plates are of drop forged steel, ground to size.



In the actuation of the three-speed gearset, is to be found the unique system which, in principle has been employed on this model from the first. The gear striking lever, instead of picking up the striking rods by direct connection within the gear box, is made to engage one or the other of two short rocker arms which are mounted on the extremities of a couple of telescoping actuating shafts. These arms have a squared jaw connection with the lever, and being placed on opposite sides of the lever can be engaged only one at a time. The chief advantage of the selective system is thus preserved, and it is impossible to slip over from one gearset into the other accidentally.

The propeller shaft, as shown in the accompanying illustration of the chassis, is equipped with universal joints of the yoke type, as is the driving shaft between the master clutch and gear box. The floating rear axle construction has been altered this year by the moving outward of the strut rods on the casing in such a way as to allow a greater amount of clearance. Another feature which is an innovation at this time is the standardization of the frame lengths and wheel bases for all models,

Digitized by Google

whether of the touring, limousine or landaulette types. The standard equipment is that shown, but the two types of closed body also are produced, the interchangeable feature eliminating all differences except those of the tire sizes. These for the closed cars are the same, except in the rear, where 34 by 4½-inch tires are employed instead of 34 by 4-inch.

The electric vehicle which is now being produced, in a general way preserves the original design of the victoria-phaeton which was first offered to the public in 1905, and has since been continued with only such minor changes as have been required to bring it up to time. In the new lot but three significant alterations have been made over the previous series. The most striking of these is the installation of annular ball bearings on all of the wheels. In addition to the regular hub brake, an emergency brake has been added, which is applied to a drum on the countershaft of the motor transmission. The third important change is in the increase of the battery capacity by the addition of two more cells to the regular equipment. The complete battery is thus composed of 32 cells, divided into two groups so disposed as to apportion the weight equally between the front and rear wheels. They are of the Exide "9 PV" type. The rating for the radius of action is placed at the conservative figure of 40 miles. The controller is simple in design and easy to operate. It provides four forward speeds, affording approximately 4, 7½, 12½ and 16 miles per hour, respectively, and two speeds in the reverse. On the second reverse speed, which is obtained by a backward movement of the lever, the carriage develops its maximum power at a low speed, thus enabling the driver to back out of any unusual depression in the highway and to avoid difficulties in turning around in narrow quarters with steep gutters on each side. The wheel base of the vehicle is 70 inches, the tread 48 inches, and the wheels are 30 inches in diameter, shod with 3½-inch pneumatic tires, front and rear.

CRANKCASE WITH CRANKSHAFT AND PISTON ASSEMBLY

REFORMATION IN POWER RATING

Purdy Suggests Adoption of "Circular" and "Cylindrical Inches"—Typical Equations to Illustrate the Idea.

New possibilities are injected into the much-vexed question of the proper method of power rating for automobile motors by the suggested adoption of the units of "circular" and "cylindrical inches" in place of the complete values of square and cubic inches as at present used. The signification thus brought about would be merely in the mathematical sense, as the figures could be converted into the more familiar square and cubic measure by simple multiplication. At the same time, the method would permit of a close comparison of motor sizes as well as of powers, according to the complete plan, on a basis of simple figures. The originator of the idea is Frederick Purdy, engineer in charge of the testing laboratories of Thomas B. Jeffery & Co., who has developed it upon the analogy of the "circular mil" system employed in electrical calculations and in current use in that field.

"In all the hill climbing contests which have come under my notice, the engine ratings have been based on the piston displacement, and invariably the volume is expressed in cubic inches," remarks Mr. Purdy.

"This is one of the mathematical absurdities that have descended through generations and have produced mental habits hard to break. Always we think of volumes as having rectangular boundary lines and we must convert all forms, however regular and common they may be, to the cubic form before we can compare them. So also we think of surfaces and sections as squares, hence our units of area are always square and we go on converting the value of circles and cylinders and spheres into terms of squares and cubes, for each equation, requiring the use of a long decimal multiplier or divider, wearing out gray matter, better devoted to more useful service.

"When we get away from this worship of the rectangular god, we are free to set up a new and convenient rule for comparing volumes and areas. Or, in other words, when volumes or areas of like form are to be compared with each other, the unit of measurement should be of the same form.

"The electrical people have adopted the "circular mil" as the unit of sectional area for wire and other conductors, which is much more convenient that a square mil for it requires only that the diameter in .001 inch be multiplied by itself to give the sectional area, and the diameter in .001 inch of a wire of any desired area expressed in circular mils, is the square root of the area.

"Thus, D^2 = area is a much shorter equation that 0.7854 D^2 = area, or 3.1416 R^2 = area, and for purposes of comparison a much better one.

"Why should not the engine builders and users adopt the cylindrical inch as the unit of piston displacement and cylinder capacity? Then the equation for displacement would be D^2 L = volume: the proportion would remain the same as if reduced to cubic inches.

"Thus the displacement of a cylinder 4 inches in diameter with 6-inch stroke = 96 cylindrical inches or 75.3984 cubic inches. Or, the displacement of a 6-inch cylinder with 5-inch stroke = 144 cylindrical inches or 115.0976 cubic inches.

"Since 96 : 144 :: 75.3984 : 113.0976, it is just the same.

"It is as easy to convert the volume of irregular cavities such as the compression space into cylindrical units as cubic units, the ration between them being of course 1 to 0.7854. The sectional area and volume of intake and exhaust pipes, the area of any circular opening such as valve ports could best be expressed in circular and cylindrical inches. . . . .

"There should also be a standard of speed at which an engine is rated or rather there should be two points at which a variable speed engine such as used in an automobile should be rated.

"Various compressions and valve timing may give an engine a high power at high speeds at the sacrifice of power at low speed and vice versa, so it is hardly fair to compare two engines of the same bore and stroke at only one speed. Hence a rating should be given at a point between 400 and 600 r. p. m. (the normal running speed) and between 1,200 and 1,600 r. p. m. (the point of greatest output).

"The power curve in most engines rated at from 30 to 50 horsepower is a rising one up to from 1,200 to 1,600 r. p. m. At some point in this range, the inertia and other losses which are rapidly rising, compensate any increased power due to speed, the curve flattens out and shortly begins to drop. Why not establish these extreme points in some engineers' convention as a standard of speed for power rating?"

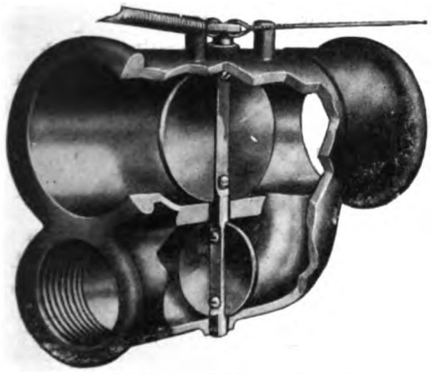
GABRIEL WITH ADAPTABLE TONES

The 1909 Model to Emit Soft Musical Sound in Cities—More Penetrating Note for the Rural Roads.



By the equipment of an ingenious device, the new Gabriel horn which has been produced for the season of 1909, may be confined to one soft musical tone for urban use or the three notes may be raised in unison as a penetrating herald on rural highways. As shown in the illustration, the 1909 Gabriel is of the single tube, three note type, resembling the 1908 model in exterior appearance. It will be supplied by the Ga-

NEW MODEL GABRIEL HORN

briel Horn Mfg. Co., of Cleveland, O., in four sizes, as different sizes are required for various motors according to their power. The gradations in size are calculated with a view to providing in each instance the proper capacity for disposing of the exhaust without causing back pressrue.

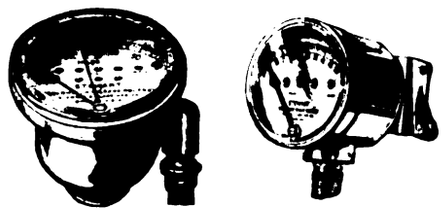
Back pressure is also provided against in the 1909 cut-out valve which is supplied for the control of the Gabriel. The picture shows that the valve disc in the main exhaust channel is at right angles to that in the channel which directs the exhaust gases to the horn. When the controlling lever on the top of the valve is turned to sound the horn, the disc in the auxiliary channel opens at the same rate that the main channel disc closes, as the two are mounted on the same

GABRIEL HORN CUT-OUT

spindle, the result being that there is no piling up of back pressure. The construction also provides for a cut-out which affords a direct opening to the air that is 1¼ inches across and is supplementary to the regular outlet through the muffler. When the cut-out is being employed, the exhaust has both the muffler and the direct opening through which to escape, giving a maximum of free discharge. In addition to considerations of correct theory and mechanical efficiency, the Gabriel valve is of a detail design which makes provision against the possibility of leakage when the valve is closed and precludes the rattle, whistling and noise which are the conspicuous fault of poorly constructed devices intended for the control and direction of the exhaust. Suitable valves to fit all standard sizes of iron pipe or steel tubing, ranging from 1 inch to 2½ inches outside diameter are available.

The most recent addition to the Gabriel family has been the Gabriel shock absorber, which is subject to several refinements and changes over past models for the 1909 season. In the new model, as is indicated by the illustration, there is no change in principle. To the body of the car is attached a friction pad which moves vertically between the spring side plates of the member attached to the axle. The two sides converge at their ends, so that the friction pad has a comparatively free movement while it is at the middle, but is increasingly compressed and restrained in its movement as it is forced toward either end. Thus an extreme upward or downward movement of the axle in relation to the body of the car is resisted and a normal relation soon re-

GABRIEL SHOCK ABSORBER



established. The 1909 model has a new method of fastening the friction pad to the body of the car, in order to provide for end motion. The fastening stud has a movable bearing to replace the former rigid connection. An increased bearing surface for attaching the channel member to the axle is also a feature. In this way all the various motions which the axle and the body suffer in relation to each other are provided for, and noise and rattle in the absorber are prevented. A new friction material is used for the sliding friction pad, whereby the effectiveness and durability of the absorber are greatly increased. Tests by the manufacturer are said to have demonstrated that the new material will permit a friction pad to be operated for from twelve to fifteen thousand miles riding without replacement, after which new friction surface may be put in at slight expense. Attachments and proper resistance plates are made for every size and weight of car.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

VARIETY IN SPEED INDICATORS

Two New Stewart Speedometers for the Season of 1909—Noteworthy Improvements in Older Models.

Little complaint can now be offered by either the dealer or the owner as to limitations on the variety of speed indicating devices that are offered for choice, as the number of models presented and the great range of prices that are to prevail for the coming season afford a market that admits of wide selection. Most of the established

STEWART, MODELS "12" AND "13"

makers have brought out additions to their lines for 1909, together with variations in previous models. In accordance with this policy, the Stewart & Clark Mfg. Co., of Chicago, Ill., have added two new models of the Stewart speedometer, which are designated as models No. 11 and No. 12, and which are to sell at $25 and $15, respectively.

By mounting the indicator hand in the center of the dial, it has been made possible in the No. 11 model to use a scale about three times as long as that ordinarily employed on instruments of this kind, the graduations, as will be seen in the illustration, extending about three-quarters around the face, which is 4 inches across

In the No. 12 model, which sells at $15, the mechanism is similar to the $25 model of the past season. The dial is 3 inches in diameter and in addition to the speed indicating hand, the face bears a 10,000 mile,

STEWART SPEEDOMETER, MODEL "11"

season odometer. The speed scale gives a maximum of 50 miles per hour.

For high speed work the model No. 5 is offered, with a scale reading to 90 miles per hour maximum. The instrument which this model supplants listed at $75, but the new model retails at $50, and is equipped with a maximum speed hand. For those who are satisfied with a lower maximum on the speed scale, the No. 4, at $40, is suitable, being a duplicate of the No. 5 in all its features except the 90 mile reading.

NEW PROBLEMS IN ROAD BUILDING

Commissioner Shanks Sees Changed Conditions—They Must be Met, He Tells Indiana Commissioners.

Taking the position that automobiles promise to be as much a part of the settled order of things as the highways themselves and that it is theferore useless to berate them for raising dust on ordinary roads, John G. Shanks, of Washington, Ind., told the county commissioners of Indiana that they must get over the idea that they "are living in the day of the saddle and the pack horse" and should build their roads to meet modern conditions. As Shanks is a county commissioner himself, representing Davies county, and knows considerable about highway construction, his speech at the convention which was held in Indianapolis, Ind., is calculated to have effect.

"There was a time," he declared, "when the wear and tear on the roads was not very great. But the time has come when any road built of anything but the best and most durable material, is going to show signs of wear in a very short time. This is true because of the increased use of automobiles and other similar vehicles, all of which ruin an ordinary road. It is a question of eliminating either automobiles or our present system of building roads.

"It has been shown time and again," he said, "that the ordinary road is not able to stand modern traffic. It becomes one of our greatest engineering studies to decide upon materials that will stand the strain. Before entering into a contract for the construction of public highways, it is up to every commisioner to consider the nature of the traffic in the particular vicinity and to select the roadbed material accordingly, having in mind the motor vehicle trafic, especially."

St. Paul Plans Thorough Road Marking.

Upon coming within a radius of 100 miles of St. Paul, Minn., it will be an easy thing for the motorist to find his way about, if the sign post plans of the St. Paul owners are carried out on the scale that has been projected. Not only the members of the St. Paul club, but non-members as well, are contributing to the fund. While strangers will be welcome to all the benefits of the thorough posting of the corners and byways, it is the St. Paul and Minneapolis contingents that will reap the most advantage, as drivers from those cities frequently get lost among the interlacings of the many roads leading to the various lakes and resorts, due to lack of proper finger posts.

Opening Paradise Valley to Motorists.

To make Paradise Valley and the beautiful Mount Rainier region in the State of Washington more accessible to motorists and tourists, an active effort is being made by commercial clubs, chambers of commerce and good roads associations thereabouts to have good roads in the district. An appropriation of $50,000 is to be asked from the Federal government, which amount when added to the sums raised locally, will permit the completion of several highways as yet unfinished, and the projection of new ones that will exploit the scenes of the mountains.

Chicago Begins an Anti-Smoke Crusade.

Following New York's lead, Chicago has decreed against smoking motor cars on the boulevards and in the parks. In fact, the Windy City is even more particular about the cars that may use its pleasure vehicle highways than is Manhattan, because no car that is not properly washed and groomed can pass the warning policemen who "shoo" away the undesirables. On a recent afternoon 100 park policemen were put at the park and boulevard entrances to enforce the new regulation, and over 800 cars were turned away, either because they were unwashed and dirty, because they dripped oil, or because they emitted offensive exhaust. "The automobile immaculate" is the standard that is being insisted upon by the authorities controlling Chicago's parks and boulevards.

Motor Cars Curing Equine Nervousness.

That motor cars have reduced horse runaway accidents on the city streets is the conclusion reached by several acute observers of metropolitan and urban phenomena. This reduction is not brought about by the supplanting of the horse, but as a result of the reduction of equine nervousness that has been brought about by getting accustomed to automobile traffic. After learning to regard calmly the swift passage of roaring, snorting, fire spitting, gear clatterng machines of all types, no trivial adventures are sufficient to make an experienced horse unruly.

Bucks County Motorists Organize a Club.

To fight speed persecution and to get good roads, the Bucks County Automobile County Automobile Club organized at the home of the Bucks County Country Club, Langhorne, Pa. The presidency was given to Dr. Harry Lovett, of Langhorne, while Ellwood Watson was chosen secretary and treasurer.

Raleigh Automobile Club Organizes.

Raleigh, N. C., is the home of the newly formed Raleigh Automobile Club. The officers elected at its first meeting are: R. D. Godwin, president; James L. Thomas, Jr., vice-president; John A. Park, secretary; and L. A. Mahler, treasurer.

Boys Form an Automobile Association.

High school boys in Alameda county, Cal., have formed the Amateur Automobile Association. Edward Chamberlain and George Ogden, of Berkeley, Cal., have been chosen president and secretary.

PREDICTS GREAT MOTOR HIGHWAYS

Capitalists Projecting Two Pioneer Interstate Roads, Says Hassam—New York to Boston Scheme Reviving.

Motor highways connecting Chicago Pittsburg, New York and Boston are not at all unlikely in the near future, because of the rapidity and economy with which special automobile roads can be built, according to Captain Walter E. Hassam, of Worcester, Mass. Capitalists are evincing a great interest in such projects, he says, and two pioneer roads are already projected. A group of Boston men, he declares, are considering reviving the scheme for a road between New York and Boston, while a Chicago to Pittsburg motor road is being actively projected in the Windy City.

As a result of his work in constructing the Motor Parkway on Long Island, Hassam comes into contact with nearly everybody that is nursing an enterprise of this kind, and because of the vigor with which the question is being taken up in various parts of the country, he foresees that it will not be a great while before many of the main highways between large cities will be paralleled with concrete roads exclusively for motor cars.

A particular feature of Hassam's method in motor road construction, is the use of wire netting between a lower and upper layer of stones. After the upper layer has been pressed down with a steam roller so that the bottom of the stones project through the wire netting, concrete is poured in, binding the stones, the netting and the concrete itself in a solid mass. One ordinary crew can construct a mile of such road in three and one-half days, it is claimed, and after it has been given a proper opportunity to set, the passage of time will make it harder the older it gets.

Motorphobia Delays Jury Trials.

Popular prejudice against automobiles and their owners is so general in Columbus, O., as to make it very difficult to fill out a jury in damage cases where automobilists are defendants. In a recent case of a $1,000 suit brought by a rural mail carrier against a motorist whose car, it was alleged, frightened the carrier's horse, the trying of the case was delayed for a long time by the fact that most of the men summoned to act as jurors openly expressed their enmity toward all operators of motor vehicles, as a class.

Forbids Use of Streets as Garages.

Automobile agents who make the street in front of their establishments a show room for the cars they handle have been called to account in Wichita, Kan. The police are taking active measures to break up the practice, and threaten arrest if it be continued.

The Week's Patents.

893,502. Motor Vehicle. Russell Huff, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a Corporation of West Virginia. Filed Dec. 18, 1907. Serial No. 407,054.

1. In a motor vehicle, the combination with the frame, the steering column, the forward spring, and the bracket depending from the frame and connected with the spring, of a steering gear casing having two arms, one of which is attached directly to the frame and the other to the said bracket.

893,549. Axle. David E. Ross, Brookston, Ind., assignor to Ross Gear and Tool Company, La Fayette, Ind., a Corproation of Indiana. Filed Sept. 11, 1906. Serial No. 334,128.

1. As a new article of manufacture, an axle made in the form of an I-beam, said axle being formed of a single piece, and having a receptacle for the gears within the flanges of the I-beam.

893,655. Cushion Tire. Charles L. Rempes, Akron, Ohio. Filed Aug. 6, 1906. Eerial No. 329,418.

1. A cushion tire comprising a shell having outer members with reinforced annularly corrugated edges and a central, radially extending reinforced supporting rib formed integral with the central portion of said shell; said rib having a wedge shaped inner edge projecting between the inwardly turned edges of outer members; substantially as described.

893,656. Internal Combustion Engine. Sigurd I. S. Ringi, Stockholm, Sweden, assignor to Motoraktiebolaget Reversator, Stockholm, Sweden. Filed Dec. 12, 1906. Serial No. 347,471.

1. In devices for actuating a valve appertaining to a four-stroke internal combustion engine, the combination of a disc having cam-slots forming two paths therein, a sliding piece adapted to describe one or the other of the said paths according to the direction of rotation of the engine, means actuated by the said sliding piece for operating the said valve, and means for causing the sliding piece to pass in less than one revolution of the disc from the one path into the other, when the direction of movement of the engine is reversed, substantially as and for the purpose set forth.

893,672. Tire for Vehicle Wheels. Reuben Stutsman, Des Moines, Iowa, assignor to The Bartholomew Company, Des Moines, Iowa, a Corporation of Iowa. Filed July 16. 1897. Serial No. 644,799.

1. A rubber vehicle tire consisting of a piece of rubber having an aperture longitudinally through it and a wire inserted in said aperture, the wire having at one end a tubular portion, and its opposite end being passed through the said tubular portion, and having its free end coiled about the portion of the wire immediately back of the tubular portion, substantially as set forth.

893,675. Distributing Gear for Explosion Motors. Max Thier, Eufurt, Germany. Filed March 18, 1904. Serial No. 200,447.

1. In a distributing gear for explosion motors, the combination with a rotary cylinder having two grooves in its circumferential surface, of a crossing of said grooves, a shoe adapted to slide in said grooves and to be moved by the same, a lever connected with said shoe and adapted to be actuated by the same, and means for causing the shoe to pass through said crossing or to evade the same; another lever adapted to be oscillated in a plane located at right angles with respect to the first lever and carrying the same, means for oscillating the second lever so as to cause this lever to oscillate the first lever in the same direction, substantially and for the purpose as described.

893,677. Resilient Wheel. John C. Turnage, Richmond, Mo. Filed Oct. 7, 1907. Serial No. 396,284.

1. A wheel having a rim provided with transversely disposed perforations, a tire surrounding the rim and being spaced from the same, coil springs interposed between the rim and the tire, plates attached to the tire and having upon their inner sides recesses adapted to receive the coil springs when they are expanded laterally and bolts passing transversely through the side plates and the perforations o fhe rim.

893,680. Shock Absorber. Lewis S. Watres, Scranton, Pa. Filed June 26, 1907. Serial No. 380,863.

1. The combination with a spring, of a shock absorber comprising a pair of non-rotary members and a rotary member, said rotary member having threaded engagement with one of said non-rotary members and having frictional engagement with the other non-rotary member, and anti-friction bearing balls interposed between the said rotary member and the latter noted non-rotary member, and so arranged that under compression or cushioning movements of said spring the said rotary member will be rotated under but slight frictional resistance, while under recoil of said spring the said rotary member will be pressed into engagement with the said latter noted non-rotary member and will be rotated under frictional resistance, substantially as described.

893,712. Starting Device for Explosive Engines. Julian F. Denison, New Haven, Conn., assignor of one-half to John E. Mar, West Haven, Conn. Filed Dec. 13, 1904. Serial No. 236,654.

In an explosive engine, the combination of a plurality of cylinders, a source of fluid pressure supply; means for admitting fluid pressure into each of said cylinders in succession to start said engine, said means comprising a valve plug inserted in the side wall of each cylinder respectively, a common valve-controlled connection between the fluid pressure supply and each of said valve plugs, a passage in each plug opening into the cylinder, a valve controlling said passage normally spring-pressed to seated position, and adapted to be actuated in either direction by fluid pressure, a second passage connecting said valve plug with the pressure connection aforesaid, a valve controlling said passage and having a stem projecting outside of the plug, a spring between the outer end of said stem and the plug tending to seat the valve; a passage connecting the aforesaid two passages in the plug; a cap-plate for said plug providing a guide for the first mentioned valve in the plug; an eccentric and rod for each of said last named valve-stems operated from the crank shaft of the engine, said eccentrics being so relatively disposed upon the shaft that one of said valve stems will be actuated by its corresponding rod in every rotatable position of the shaft, and means for guiding said rods.

893,715. Vehicle Wheel. Ezra Fishburn, Overbrook, Kan. Filed Sept. 10, 1907. Serial No. 392,094.

1. In a vehicle wheel, the combination with the peripheral covering secured together with lacing to the felly of the wheel a cushion tire, cable wires passed through said tire, a felly, a metal band passed around

U&H

The MAGNETO that STARTS ITSELF

A, reverse side of steel driving disc; B, special bronze disc which slips over end of armature shaft C, and drives armature; E, end of coil spring engaging steel disc A, by means of pin (not seen) in front face. The other end of E is attached to B. F, G, co-acting cam-shaped faces which act as stops; J, stationary steel face cam; K, hollow shaft projecting from front of A and carrying driving gear; L, cover plate (reversed).

A slips over C following B, and drives B counter-clockwise through the tension of spring E, which holds faces F G together. When cranking, the steel ball in slot I drops into engagement with cam J and is forced against the flat face of A, thereby holding B and the armature against rotation. A continues to turn until the radial depression meets the ball, which slips into the depression and releases B. The spring carries B quickly past the firing point until faces F G come together. This gives maximum spark with retarded timing.

When the motor starts, centrifugal force carries the ball outward from the cam J, and the spring holds A and B together as a single unit.

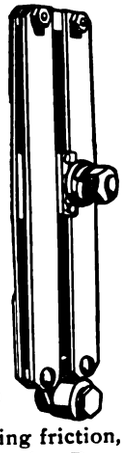
KENOSHA, WIS.

No matter what style of car you own—steam or gasoline, touring car or runabout, air-cooled or water-cooled—*there's a special grade of Mobiloil for it.* A wonderful trouble-proof oil that lubricates most at minimum feed. Won't cause fouling of spark plugs and valves.

VACUUM

MOBILOIL



is the right oil for *your* car under all conditions. As a safe and scientific lubricator for every style and type of automobile engine it has no equal.

Send for Mobiloil booklet which lists every make of automobile and tells what grade of Mobiloil to use for each. It's free.

Mobiloil in barrels, and in cans with patent pouring spout, is sold by all dealers. Manufactured by

VACUUM OIL CO., Rochester, N. Y.

Going Up

isn't so unpleasant. It's the finish of the reverse motion that makes the nerve centers yell for

1909 Gabriel Shock Absorbers.

Jolts and jars are taken up by a retarding friction, gradually applied in proportion to the shock. Does not interfere with the natural resiliency of springs over smooth roads.

Our new model has improvements which give increased bearing surface, eliminates noise or rattle and greatly increases its effectiveness and durability. Can attach to any car or any type of spring.

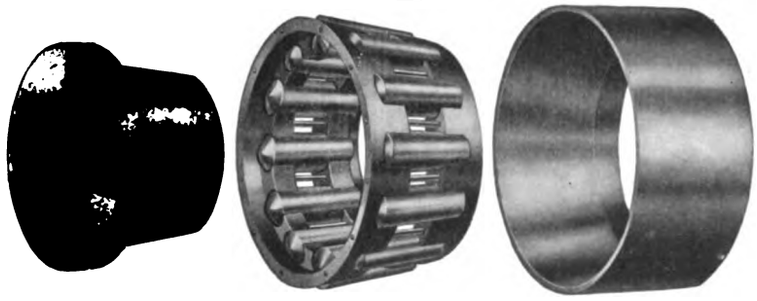
Write for full description and prices.

GABRIEL HORN MFG. COMPANY
1417 E. 40th St., Cleveland, Ohio.

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.



¶ **SUPPLEMENTARY SPIRAL SPRINGS** take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.

¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

Tires WIN

FAIRMOUNT PARK 200-MILE RACE

There was but one winner in the Fairmount Park 200-mile race, despite the cleverly worded advertisements written to create an entirely different impression.

The winner was the Locomobile No. 10, equipped with FIRESTONE STANDARD CLINCHER TIRES ON FIRESTONE DEMOUNTABLE RIMS. This was also the equipment of the other Locomobile entry which made such a good showing.

The tires used were out of regular stock and both cars went through without any tire trouble. Of the sixteen starters only five cars finished and two of these were those with Firestone Tires.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. THE BRAMPTON CHAIN is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMPTON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

The New Stewart

Model 11. Destined to be the most popular, most attractive, most accurate, most satisfying, and the quickest selling speedometer ever produced.

Model 11 **$25**

Full size 4-in. model. Scale, 0 to 0 miles. Enclosed Season Odometer. Enclosed Automatic Resetting Trip Odometer. Scale 7½ inches long. Equipped with famous Stewart Flexible Shaft and Swivel Joint.

NEW CONSTRUCTION

Multipolar Induction Principle

Operating on the induction principle, utilizing the current from a multipolar generator. This construction permits the use of an indicating member of low inertia, thus insuring the most sensitive and accurate reading from 0 to 60 miles.

The needle acts from the center of the dial, which arrangement permits the use of a scale three times as long as ordinarily used, making it the most easily read of all speedometers. It is equipped with a season odometer—capacity 10,000 miles and repeat, also our new trip odometer of three dials, registering miles and tenth, and which may be reset to zero automatically by means of a push button.

The construction is of the costliest kind, every part of the same high standard used in all Stewart Speedometers and includes jewel bearings. The equipment will be the regular Stewart link-type flexible shaft and patented swivel joint, furnished with our highest priced models.

We recommend this exceptional instrument to the motorist who desires the best speedometer that money can buy—the best irrespective of price—who wants a speedometer to indicate the exact speed and correct mileage of trip and season, and do it constantly day after day and year after year.

We stand back of Stewart Speedometers with a Five Year Absolute Guarantee

THE ONLY speedometer built to carry a long-term guarantee

Ready for delivery about November 15th. Send for catalog.

$1500 for a Car

Embodying $11,000,000 Worth of Experience

There are two kinds of cars:

One is made merely to sell at a low price. The other is made to give service; is mechanically correct; is constructed of the best material, and is sold at a modest percentage of profit over the cost. That is the Mitchell $1500 car.

The manufacturer's experience; his reputation, and a large plant can alone guarantee a good car at a low price.

We buy and make on a large scale. We can turn out a car at a figure wholly prohibitive to the small maker.

$11,000,000 worth of Mitchell cars have been giving complete satisfaction for eight years.

Our plant is now four times as large as it was when we started to make these cars.

Our $1500 car is perfect all the way through down to the smallest details. We couldn't use more care or better material in its construction if we asked twice as much for it. In it is crystallized all of our eight years' experience.

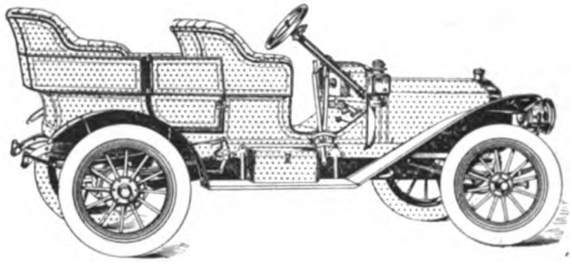
A big, roomy, luxurious 5-passenger touring car, with 4-cylinders, 28-30 horse power engine and capable of doing 50 miles an hour. This is our Model K which we offer you for $1500.

We even go further than this. We include $300 worth of actual automobile value which with any other $1500 car you would have to buy extra.

For instance, our price includes a $150 Splitdorf Magneto in addition to the regular battery ignition system.

It includes 32-inch wheels and 4 inch tires—all other $1500 cars use 3½ inch tires. Our tires cost us $50 more per set than the 3½ inch tires.

It includes a dozen other features which you would expect to find only in cars selling for $5000 or more. Our crank shaft has five bearings; one at each end and three in between. Others have two—one at each end. Imagine the play, the weakness.



We have built 5000 crankshafts and not one has ever broken.

Our transmission is of the best selective, sliding gear type—the kind that is used in all of the well known high-priced cars.

Our cylinders are cast separately.

We use as much vanadium or nickel steel as the most expensive cars on the market.

We use aluminum castings wherever possible and we strengthen them with bronze.

Our tonneau is detachable, and you have your choice of three styles of body.

Two complete ignition systems—the Splitdorf $150 Magneto and the ordinary battery system.

The lubricating system is the best we have found in our eight years experience.

If we were not equipped to turn out ten cars to the other makers one this Model K Mitchell would certainly cost you $2000 to $2500.

Remember, that we do not buy parts from other makers. We build our cars, from the ground up, here in our own factory.

Many concerns buy their parts from separate makers and simply assemble them. Such cars are experiments—each individual car is an experiment.

But we are able to machine our parts to the accuracy of 1-10000 part of an inch. So our car is in harmony at every point. It is silent and smooth and reliable.

Don't take our word for these facts. Examine the car yourself, ride in it, give it the hardest try out you know. Then if it doesn't make good don't buy it.

Full particulars upon request.

THE "30" LOCOMOBILE SHAFT DRIVE MODEL FOR 1909

THE MOTORING PUBLIC WILL BE INTERESTED IN READING THE FOLLOWING CIRCULAR ANNOUNCING **1909** LOCOMOBILE MODELS WHICH THE **LOCOMOBILE** COMPANY OF BRIDGEPORT, CONN., HAS RECENTLY SENT TO THEIR DEALERS AND CUSTOMERS:

We signalize our tenth anniversary of the production of automobiles by the announcement of two splendid models—undoubtedly the best that we have ever offered to the public.

Ten years ago the Locomobile demonstrated for the first time the wonderful possibilities of the motor car, and gave the automobile business its first great impetus. To-day the Locomobile is held in the highest esteem. It is everywhere regarded as a car of the highest quality—a car of *composite* merit, satisfactory in every respect. It is specially noted for reliability, and experts agree in rating it the most durable car on the market.

The 1909 product will enhance the high reputation the Locomobile has gained.

We announce an entirely new model "30" *Locomobile,* a five-passenger touring car intermediate in power between our "20" and our "40." It will be equipped with shaft drive.

The "40" *Locomobile* should be the logical choice of those who desire a *high powered car.* The "40" will be produced as a seven-passenger touring car, a stylish roadster, and as a closed car with Pullman Limousine or Landaulet body.

This circular will furnish advance information about 1909 Models, until our preliminary catalog is ready.

ADVANCE INFORMATION CONCERNING 1909 MODELS

"40" LOCOMOBILE.

This car is thoroughly typical of Locombile construction and is the most powerful model we have ever built. It is equipped with a four-cylinder motor of 5-inch bore and 6-inch stroke, giving about 60 horse-power on the testing stand, thus affording high speed and fine hill climbing ability. The artillery wheels are 36 inches in diameter; the tires are 36 x 4 inches front and 36 x 5 inches rear. The wheelbase is 123 inches, and the length over all is 16 feet 1 inch.

The "40" *Locomobile* is a splendid touring car for seven passengers and is notable for it beauty of line, luxurious appointments, and delightfully easy riding qualities. It is a touring car par excellence and will meet any test of endurance to which it can be subjected. *Price, with lamps and equipment,* $4,500. *Top extra.*

The "40" *Runabout,* brought out near the close of the 1908 season, will be an attractive feature of the 1909 production. The body is very attractive and accommodates four passengers, all seats being very

Digitized by Google

comfortable and easy riding and convenient of access The individual front seats are fixed; the rear seats may be removed or only one or both can be used, making the car available for two, three or four passengers as desired. The "40" Runabout can also be supplied with the type of body known as the "toy" or "baby" tonneau, and which enjoys considerable popularity. *Price, with standard body or "baby" tonneau, including lamps and equipment,* $4,500. *Top extra.*

The "40" Limousine and the "40" Landaulet are both beautiful high-powered closed cars. The bodies are roomy, beautiful in design, of the best possible workmanship and finish, and are equipped with extra Pullman chairs. *Prices of these closed cars announced later.*

"30" LOCOMOBILE.

This model is equipped with a four-cylinder motor of 4½-inch bore and 4½-inch stroke, giving about 38 horse-power on the testing stand. As the new model is intermediate in size between the "20" of former years and the "40" Locomobile, it is rated as a "30."

The car embodies all of the special features which have for years identified the Locomobile, such as low tension ignition; bronze engine base and gear box (much stronger than aluminum commonly used); alloy steel in the crankshaft, steering gears, transmission shafts, pressed steel frame, gears, and other important parts; heat-treated drop-forgings of our own manufacture; four-speed selective transmission; imported ball-bearings in wheels, gear box, and other important places. The wheelbase is 120 inches, yet the car can be turned in a 38-foot street. The length over all is 15 feet. The wheels are 34 inches in diameter, tires are 34 x 4 inches front and 34 x 4½ inches rear.

The body is graceful in design and very commodious, seating five adults with entire comfort. *Price of the "30" Locomobile touring car, as illustrated with lamps and equipment,* $3,500. *Top and speedometer extra.*

Another variation of the "30" Locomobile is the "30" *Runabout,* a roadster of the latest type with sharply inclined steering post and equipped with a body similar to that of the "40" Runabout, and which may be used for two, three or four passengers as desired. It will also be supplied with the "baby" tonneau. *Price, with lamps and equipment,* $3,500. *Top extra. Prices of closed cars announced later.*

A feature of the new "30" chassis is the use of shaft drive, the details of which are described in the following paragraphs:

LOCOMOBILE SHAFT DRIVE CONSTRUCTION.

We have long appreciated that shaft drive has some very desirable features when applied to a car of the size of the "30" Locomobile. Our new shaft-driven car is fully equal in reliability and lasting qualities to our famous chain-driven cars, and we believe that it combines more good features than any other car on the market, whether of foreign or American design. Some of these features are as follows:

1. *Complete removal of all torsional stresses from the car axle tubes.* Distance rods, similar to those on our chain-driven cars, transmit the driving stresses to the frame and maintain parallelism of the front and rear axles. These distance rods carry the brakes, and their rear ends are free to turn on the axle tubes. Consequently when the springs are depressed the distance rods turn on the axles and do not twist them. Also, when the brakes are applied the braking stresses are not communicated to the rear axle or driving mechanism. Also the power is not transmitted through the springs.

The spring chairs are also free to turn on the axle tubes, and thus the only duty of the springs is to carry the load. This arrangement makes the Locomobile shaft drive car a very easy riding one, in addition to removing all torsional stresses from the rear axle tubes.

All brakes are enclosed and protected.

2. *Exceptionally strong rear axle construction.* The axle tubes are of alloy steel with inner ends forced into the openings of the differential housings by hydraulic pressure and securely riveted in place. Unlike many or most cars, no brazing whatever is used. It will be noted that our form of construction would be the strongest possible in any case, but owing to the removal of all torsional stresses from the tubes it is really very much stronger than necessary. There is no tendency for the tubes to loosen in the housing.

3. *Straight line drive.* When the car is loaded the propeller shaft is almost exactly horizontal—thus the power of the motor is transmitted in a straight unbroken line to the rear axle, thus eliminating loss of power through the universal joints.

4. *Complete universal action.* The propeller shaft is not only horizontal, but is provided with a universal joint at the front end and a *slip universal joint* at the rear end. The latter compensates for any change in distance between the rear axle center and the gear box. The two universal joints compensate for all other stresses as well, so that the transmission of power from the motor to the rear axle is perfectly accomplished without any binding or straining under any road conditions. As the propeller shaft is horizontal, there is very little action on the part of the universal joints, and very little power absorbed by them—furthermore, as the joints are of the best construction, fully protected and lubricated, the *wear* is reduced to a minimum.

5. *Flexible drive.* A torsion rod is provided to overcome the torque reaction of the bevel driving gears. The rear end of this rod is made fast to the differential housing and the front end is connected to the cross member of the chassis frame by a spring suspension. When the car is started in either direction the springs are compressed and the torque reactions are absorbed, reducing the tendency to raise the body when the car is started. Thus the drive from the motor to the rear wheels is a flexible one—a most desirable feature.

6. *Truss rods.* Diagonal tension rods extend from the lower part of the differential housing to the outer extremities of the rear axle tubes. These truss rods transmit the stresses to the wheels instead of permitting them to be concentrated at the center of the axle. This form of construction produces an axle of moderate weight and maximum strength.

7. *Excellent design for driving axles.* The driving axles are of the floating type and rotate inside of the axle tubes. As the weight is all carried on the tubes, the axles only have to transmit the power. The inner ends have a square fit into the differential bevel gears and the outer ends are in the form of dogs or jaw clutches integral with the axles. These engage with the hubs of the wheels, affording an absolutely positive drive and at the same time making it possible to remove the driving axles at any time by simply removing the hub caps.

Summary. It will be seen that the Locomobile shaft drive construction runs very nearly parallel to the Locomobile chain drive construction, and that every weak spot in the shaft drive has been studied and overcome. The most exhaustive road tests have proven most conclusively the durability and lasting qualities of the new Locomobile shaft drive.

LOW TENSION IGNITION.

Locomobile low tension ignition adopted in 1905 will be continued. We have had four years' experience with high tension ignition and an equally long trial of low tension ignition, and the results indicate that the latter is far superior in reliability. The Locomobile low tension system differs from the ordinary make-and-break on account of the simplicity of the design and the use of iridium contacts, which does away with frequent and unnecessary timing of the igniters. Locomobile low tension ignition is superior to any form of jump spark on account of the fact that the electrical problem is infinitely more simple and enables the simplest type of magneto to be employed. Furthermore, our system is superior to the high tension ignition because there is no danger from short-circuiting and no complicated wiring—nothing but a few feet of low tension cable.

Mongrel or Thoroughbred?

NOW IS THE TIME for you, Mr. Thoughtful Dealer, to decide what you will sell in 1909.

WILL IT BE A MONGREL? a car assembled from parts carried together from all over the country and hammered into shape as well as may be?

OR WILL YOU SELL THE THOROUGHBRED—a homogeneous mechanical masterpiece, every single part of which is the result of the same genius that devised the whole?

"ASTOUNDING," "MARVELOUS," "WONDERFUL," are the terms with which some assembled cars are now tagged, though they are astounding, marvelous and wonderful only to the assemblers, who like Rip Van Winkle, have been dozing in the growing woods of automobiledom and who now, bewildered by the progress that has been going on, seize upon time-tried and long-established practices and herald their adoption by the assemblers as brand-new discoveries.

LET'S REASON IT OUT: On the one hand you have the assembled car, with an engine bought from one manufacturer, a frame from another, and a transmission from a third, and so on down to the last rivet. The maker of the engine, the mill in which the frames are pressed, the transmission man, all derive their separate profits, leaving no other way to the assemblers to obtain their rewards than by skimping the quality of their "product."

AND THEY DO IT—THEY MUST! When you examine some of these astounding cars you will be truly astounded on finding that the four-cylinder engine is cast in one piece and has only two main bearings, whereas the Maxwell has four cylinders and five main bearings. You know well enough that making a motor with only two bearings is equal to leaving the engine to its own devices as far as alignment is concerned.

IT WILL BE A TOUGH JOB FOR THE DEALER to convince the purchaser who is wise that some four-cylinder engines of small dimensions will develop as high as 30 horsepower—because they can't.

MAXWELLS ARE A HOME-GROWN AMERICAN PRODUCT. The use of Maxwell features in Maxwell cars was neither a heaven-given inspiration nor the aping of foreign design, but the outcome of sound engineering sense.

WHEN 10,116 MAXWELL OWNERS testify to the excellence of their cars, all of which have been sold by Maxwell dealers, then the Maxwell proposition is one that you can't afford to pass by.

BEFORE HITCHING YOUR WAGON TO A STAR it will be wise for you to find out all about a dealership for Maxwells, the success of which is past and present, instead of lying in the dark and distant future that has swallowed so many wonderful cars that have been marvelous chiefly in their complete and rapid disappearance from the field of legitimate competition.

Benj. Briscoe
President.

Matheson

1909

Prices Reduced $1,000

And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for **the best.**

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still **maintain the unequalled quality** of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by **doubling the factory output** and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital **has been increased by** $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, **at the makers' former prices to the agent or dealer;** namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5 500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

MATHESON AUTOMOBILE COMPANY

NOTE THIS PERFECT SCORE!

Once Again the Auto-Meter Shows Its Supremacy—This Time in the Chicago Thousand Mile Endurance Run.

Five cars finished with perfect scores—4 of which were equipped with a Warner Auto-Meter —two Haynes—a Pierce and a Premier.

The miles registered for the two Haynes cars at the finish varied only 1-10 of a mile. Think of that for accuracy in a straight run of 1,000 miles. Significant was this fact, too, that no cars were penalized on account of Warner Auto-Meter falling down.

The drivers knew, to make a perfect score—to keep a certain speed maintained mile to mile—they could rely on the Auto-Meter as an accurate gauge.

These far sighted winners of perfect scores realized the Auto-Meter could be depended upon in any weather under any road condition—so it was selected because it was necessary.

The Warner Auto-Meter

The Warner Auto-Meter is the very utmost in a speed gauging instrument. Its supremacy is undisputed.

The Auto-Meter always has been used by the Glidden Pathfinders when they lay out the routes for the Glidden tour, because they know it's accurate to a fraction.

In the New York-to-Paris race the Thomas, the winner and only American contestant, was equipped with an Auto-Meter.

Equip your own car with a speed indicator that is infallible—any other kind is unnecessary. The Auto-Meter is the only kind that is.

Write for more details and arrange for a trial of the Auto-Meter. Address your requests for Free Trial to our nearest Branch House.

Morgan & Wright Tires

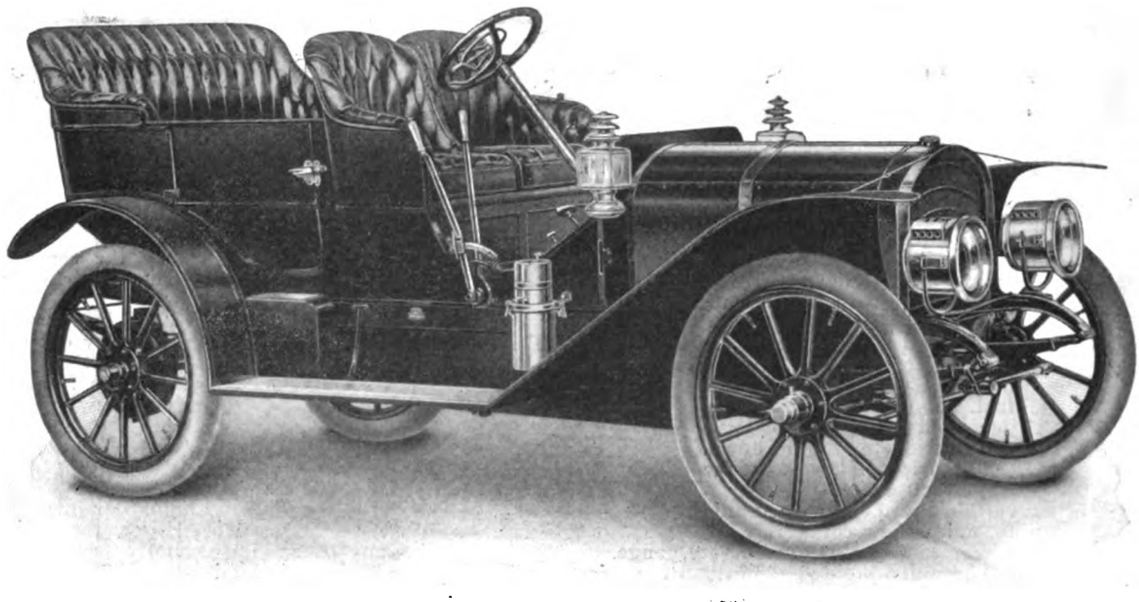
will give you considerably more and better service than you are accustomed to receiving from pneumatics

It's safe to say that the amount of service this man received was more than he bargained for.

He writes:

"Have driven four of your tires for two seasons, making over 14,000 miles, and am still using the same set."

Yours respectfully,
St. Louis, Mich., Oct. 2, 1908. D. R. ANDREWS, M.D.



Don't put us on record as saying that every Morgan & Wright tire will give 14,000 miles service. The car weight, road conditions and Dr. Andrews' skill as a driver were possibly all in favor of his making such a record.

His experience does, however, show the service Morgan & Wright tires are capable of giving if treated properly.

Why not specify them on your car?

MORGAN & WRIGHT, DETROIT

Model 34, Price $2,250

Two Vital Features of This Car.

THE offset crank shaft and straight line drive, more than any other features are responsible for the unusual efficiency, the high delivered power and the wonderful flexibility of control of this four cylinder, five passenger

Rambler

Most automobiles can develop sufficient power at high speed, but the owner's greatest need is for power at slow engine speeds—power on the hills—in stretches of sand and mud.

The offset crank shaft and stright line drive give flexibility, allow more high gear work without overtaxing the engine; that means less gear changing; less clutch manipulation—therefore ease and economy of operation.

This car can be throttled down to operate smoothly and steadily on high gear at three miles an hour. Or it can run forty-five miles an hour.

These features besides those big wheels, big tires, long wheel base, accessible engine, safety starting device, reinforced tubular axle, finished parts of genuine mahogany, perfect brake control, and large luxurious body, make this a car of highest quality.

Ready for immediate delivery. Please write for details now.

Thomas B. Jeffery & Company, Main Office and Factory: **Kenosha, Wis.**

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, October 22, 1908. No. 4

ELECTRIC VEHICLE SUES BUICK

Seeks to Enforce Payment of Alleged Overdue Selden Royalties—Papers Served in New York.

Suit has been brought by the receivers of the Electric Vehicle Co., of Hartford, Conn., against the Buick Motor Co., of Flint, Mich., for an accounting and back royalties for the past year, alleged to be due under the Selden patent agreement which the defendant company entered into with the plaintiff and with the Association of Licensed Automobile Manufacturers at the time of its admittance to membership in the latter organization. The action is the result of a resolution adopted September 3 by a three-fourths vote of the A. L. A. M. calling upon the Electric Vehicle Co. to institute legal proceedings against both the Buick Motor Co. and the Olds Motor Works for the collection of their unpaid Selden royalties. The Olds suit was begun promptly thereafter and the company's Selden license subsequently canceled.

Service has been made on the New York branch of the Buick company by Joline, Larkin & Rathbone, the attorneys for the Electric Vehicle Co., so that the proceedings are now actually under way. In selecting attorneys for its defense, the Buick company has chosen the firm of Ward, Hayden & Satterlee. The retaining of this firm by the Buick interests is regarded as having considerable trade significance.

Asserts Prior Lien on Baker Assets.

The affairs of the bankrupt Baker Motor Vehicle Co. of New York, have been found by the receiver, James N. Rosenberg, to be in a complicated state by reason of the fact that the Baker Motor Vehicle Co., of Cleveland, O., for whose products the New York company had the agency, claims a prior lien on the assets over all the other creditors. The Cleveland company is a creditor to the amount of $25,000. In asserting its precedence it says that when the creditors of the New York company granted an extension some time ago, they agreed to subordinate their debts to new debts incurred since the extension, and maintains that the $25,000 indebtedness in question comes within the terms of the agreement. Litigation is likely to be necessary in order to determine the rights of the various creditors.

Union Carriage to Make Automobiles.

After considerable experimentation, the Union Carriage Co., of St. Louis, Mo., has decided to build automobiles for the coming season, and plans to market at least 500 the first year. The company has made horse-drawn vehicles for the past 17 years, its annual output being about 15,000. The officers of the company are George E. Deeds, president; W. C. Ingram, vice-president; George A. Laws, secretary, and John B. Keough, treasurer.

Githens is Now G & J Sales Manager.

Herbert A. Githens, who for seven years has traveled in G & J interests, has been appointed sales manager of the G & J Tire Co., of Indianapolis, Ind. He will not push automobile tires alone, but will have charge of the sales of all the departments of the company.

Wilcox Resigns from the Gearless.

George Wilcox, general sales manager of the Gearless Transmission Co., of Rochester, N. Y., has severed his connection with that company. His future plans are not yet announced.

Buggy Builders Take to Motors.

The Borough & Blood Buggy Co., of Marshall, Mich., has commenced the manufacture of motor vehicles. The machines are to be of the high wheeled buggy type.

Jackson Leaves the Thomas.

R. B. Jackson, general manager of the E. R. Thomas Motor Co., of Buffalo, N. Y., has resigned. He will take a rest of several weeks before assuming any new duties.

PLAN TO PAY CLAIMS IN FULL

Pope Motor Car Receivers Take Steps to Liquidate Indebtedness—No Sale of the Toledo Plant.

Negotiations are at present under way looking to the completion of a plan by which the creditors of the Pope Motor Car Co., of Toledo, O., will receive 100 cents on the dollar for their claims, following which the court will be asked to discharge the receivers. Efforts in this direction have been progressing for some time, and now enjoy the prospect of complete success.

The company's indebtedness to the banks, and to creditors in the trade is between $300,00 and $400,000, and the recent sale of the Waverley plant at Indianapolis, Ind., for $200,000, together with the $101,000 balance which the Indianapolis plant had in the bank has added to the available cash sufficiently to make it not improbable that a total may be arranged for that will enable the receivers to pay all the outside obligations in full.

For some months there have been rumors of the sale of the company's plant at Toledo, to R. D. Apperson, of Lynchburg, Va., arising from the fact that the latter was given permission by the receivers to examine the plant and to have his own auditors investigate the books, with a view to his purchasing. No options were either given or asked, however, and the negotiations have since languished to a point where there is little likelihood of the deal going through.

Aurora Composition Accepted.

Upon a showing of the assets on hand, the creditors of the bankrupt Aurora Motor Works, of Aurora, Ill., at a recent meeting agreed to a composition of 10 per cent. in cash or notes for the full amounts, due in one year and signed by the company. The settlement suggested is subject to confirmation by the court.

Digitized by Google

In the Retail World.

The Rambler Automobile Co., of Kansas City, Mo., has been formed, and, as the name indicates, will devote itself chiefly to the sale of Rambler cars. E. G. Anderson will be general manager.

Bankruptcy proceedings have been brought against the General Motor Car Co., of San Francisco, Cal. Some of the petitioners have claims amounting to over $2,000, and a preference of creditors is alleged.

J. O. Caldwell, Jr., formerly in the automobile business in Boston, Mass., has located in Nashville, Tenn., and will open a garage and jobbing supply house at 145 Third avenue, North. He will also handle the Regal car.

As treasurer of the Ohio Motor Car Co., No. 1938 Euclid avenue, Cleveland, O., May A. Post has made an assignment to William B. Woods, in the insolvency court. The company's assets are estimated at $2,000 and its liabilities at $24,000.

The American Stepney Spare Wheel Co. has moved from 341 Fifth avenue to 1773 Broadway, New York City. The larger space facilitates the Eastern distribution of Stepney spare wheels, made by the Spare Motor Wheel of America, Ltd.

The Boston branch of the Firestone Tire & Rubber Co., has been removed from 9 Park Square to 145 Columbus avenue. In the new quarters complete facilities for handling solid and pneumatic rubber tire work of all classes have been installed.

The Matheson Company, of Maryland, has been formed to handle the Matheson in Maryland, Virginia and the District of Columbia. J. J. Mason is president of the company, which has secured a salesroom and garage at 1002 Morton street, Baltimore, Md.

The aristocratic precincts of Massachusetts avenue are to contain the Boston branch of Thomas B. Jeffery & Co., as Manager Charles has taken a lease of the finely appointed establishment at 95 Massachusetts avenue heretofore occupied by the Morrison-Price Co.

The Levy & Hipple Motor Co., now at 390 Wabash avenue, Chicago., Ill.,, has acquired the property at 1467-69 Wabash avenue for a salesroom and garage building. The new building will be three stories high, costing $25,000, and will have a front of white tile and glass.

E. P. Weber succeeds W. P. Cronin as manager of the Boston branch of the Diamond Rubber Co. As a special traveling salesman, Cronin will have his headquarters at a factory in Akron, O. His successor at Boston was a salesman in the company's Philadelphia branch.

The William R. Ruess Automobile Co., a newly organized concern, has taken three stores at 1028-30-32 South Main street, Los Angeles, Cal., which are to be made into one large salesroom and garage, the latter having a sign reading: "We Never Close." The company will handle Pope cars.

The J. A. Orlando Auto Co., of Columbus, O., has been put into the hands of a receiver, Judge M. G. Evans having appointed Harry E. Price in that capacity. The petition was brought by Jesse M. Morrison, who has a one-third interest in the firm and who represents that James Orlando, his partner, is wasting the concern's resources.

Matheson Chooses Its New Officers.

At the annual meeting of the stockholders of the Matheson Motor Car Co., of Wilkes-Barre, Pa., the election of officers resulted in Colonel Asher Miner being chosen as president, to succeed Charles W. Matheson, who is taking charge of the Matheson Automobile Co., of New York, the selling organization for the Wilkes-Barre company. J. W. Hollenback was elected vice-president, while Frank Matheson was re-elected secretary and general manager, and R. Nelson Bennett, treasurer, with Daniel C. Mackay assistant treasurer. The board of directors now includes J. W. Hollenback, I. M. Thomas, John A. Turner, Asher Miner, W. C. Sheperd, R. Nelson Bennett, W. H. Son, Frank Matheson, Charles W. Matheson, John C. Bridgman and E. S. Fretz.

Ajax Lands a Record Tire Order.

What is declared to be the largest order for automobile tires ever given has been awarded to the Ajax-Grieb Rubber Co., of New York City. The order calls for a total of 29,000 tires to be delivered before July 1, 1909, to the Maxwell-Briscoe Motor Co., the sum involved being over a half-million dollars.

Coleman Comes for a Brief Visit.

Frederic Coleman, manager of the London branch of the White Company, arrived in this country last week for a short visit. He regards the outlook in England for the coming season as not unfavorable, especially for steamers, in which he finds no serious competition.

Will Manufacture Cars in Goshen.

The Goshen Motor Works, which has incorporated with $25,000 capital, is making preparations to manufacture automobiles and engines in Goshen, Ind. The directors of the company are Orlando D. Ihrig, Guy B. Kessler, Lewis E. Ihrig, et al.

Goodyear Adding to Its Plant.

Ground has been broken for a new factory building adjoining the present plant of the Goodyear Tire and Rubber Co., Akron, O. It will be five stories high, 80x300 feet. About 300 more men will be employed.

Firestone Factory is Enlarged.

A four story addition to the factory of the Firestone Tire and Rubber Co., of Akron, O., is being constructed. It will be used exclusively for tires and is planned to increase the output by 25 per cent.

The Week's Incorporations.

Newark, N J.—Non-Blow-Out Auto Tire Co., under New Jersey laws, with $600,000 capital. Corporators—Edward D. Birkholz, Frederick R. Tyrell and R. S. Terhune.

New York City, N. Y.—City Autocab Co., under New York laws, with $250,000 capital. Corporators—L. F. Braine and Harry H. Gardiner, 32 West Fortieth street; Lloyd Milnar, 452 Fifth avenue, New York City.

New York City, N. Y.—White Tire Co., under New York laws, with $250,000 capital; to manufacture tires for automobiles. Corporators—L. L. Stein, L. L. Doblin and N. Coleman, New York City; E. P. White, Chicago, Ill.

Jersey City, N. J.—Standard Universal Rim Co., The, under New Jersey laws, with $50,000 capital; to manufacture metal wheels and rims. Corporators—B. S. Mantz, J. R. Turner and S. A. Anderson, of Jersey City.

Homestead, Pa.—Triumph Automobile Tire Co., The, under West Virginia laws, with $1,000,000 capital; to manufacture solid automobile tires. Corporators—H. E. Hayes, C. O. Derr and W. O. Johnson, Homestead, Pa.

Buffalo, N. Y.—Preston Fabric Co., The, under New York laws, with $100,000 capital; to manufacturer automobile and cycle tires. Corporators—C. Wesp, M. R. Evans; J. F. Preston, P. Wesp, Jr., and A. S. Collins, Buffalo.

New York City, N. Y.—American Demountable Rim Sales Co., under New York laws, with $50,000 capital; to manufacture and deal in vehicle wheels, rims and tire fastenings. Corporators—J. F. Paine, D. E. Sullivan, M. T. Loebl.

New York City, N. Y.—Motor Transportation Co., under New York laws, with $20,000 capital. Corporators—George S. Hayes, 1876 Broadway; B. H. Hayes, 527 West 143d street; L. Vance-Phillips, 647 Madison avenue, New York City.

Troy, N. Y.—Hygrade Rubber, Bicycle and Automobile Supply Co., under New York laws, with $10,000 capital. Corporators—Arthur W. Rood, Burdett and Hudson streets, Troy, N. Y.; Percey B. Whitmore, 206 West 114th street, and George M. Post, 471 West Twenty-second street, New York City.

Receiver Continues Duerr Business.

At a meeting of the creditors of Charles A. Duerr & Co., Inc., of New York City, held in the office of Lindsay Russell, the receiver, on the 14th inst., it was decided to let the receiver continue the garage business of the bankrupt for a period of sixty days. Meanwhile a further meeting of the creditors will be held to elect a trustee to succeed the temporary receiver.

Youse Introduces Taximeter Cabs.

E. S. Youse, of Reading, Pa., has started the Reading Taximeter Cab and Baggage So. It will operate from his garage.

PATENT WAR ON MIDGLEY'S RIM

Repeated Efforts to Have His Invention Declared Unpatentable—Mell Scored by the Court.

That a vigorous and sustained warfare against Thomas Midgley's efforts to secure full and adequate patents on his well-known "Midgley" detachable rim has for some time been maintained before the Patent Office, is disclosed by a decision which has been handed down by the Court of Appeals of the District of Columbia. The decision grows out of an effort by Tod J. Mell to have Midgley's invention declared unpatentable, and is the result of a long and bitter fight, in which, apparently, every available technical subterfuge has been employed to prevent Midgley's patent coming to issue. Starting as an interfernce case, in which Mell endeavored to disprove Midgley's priority over himself in the invention of this form of rim, the essence of Mell's attack has latterly changed to an endeavor to establish the non-patentability of the rim at all.

In this, however, he has been supported only by one primary examiner, who dissolved the interference on the ground that the invention was unpatentable, but who was subsequently overruled by the commissioner of patents. Mell appealed to the courts against the commissioner's decision, but the resulting judicial opinion gives him little comfort and takes pains to score him for "seeking to rob his adversary of the fruits of his victory."

In the written decision by the court, Judge Van Orsdel recites the history of the case in part as follows:

This is an appeal from a decision of the Commissioner of Patents in an interference proceeding. The issue is involved in the following counts:

1. In a vehicle wheel, the combination with a main rim member and a removable side flange, said main rim member having a bead of rib extending toward the center of the wheel and a removable side flange having a similar bead or rib, of an expanding locking ring engaging both of said ribs or beads.

2. The combination with a wheel-rim, of a ring having an outwardly-extending and inwardly-turned flange at one edge to engage the tire, and extending across and secured to the outer surface of the rim, a ring having an outwardly-extending and inwardly-turned flange to engage the tire at the other side, flanges on the adjacent edges of said rings extending inward therefrom parallel with one side of the rim, and a severed ring engaging said flanges to secure the rings together.

The appellant, Tod J. Mell, filed his application for letters patent on December 19, 1905, and the appellee, Thomas Midgley filed his application on April 29, 1905. The interference was declared October 23, 1906. In his preliminary statement, Mell alleged dates subsequent to the filing date of Midgley. On the face of the record, Midgley was entitled to a judgment of priority. Confronted with this embarrassing situation, Mell filed a motion to dissolve the interference on the ground of the non-patentability of the invention in view of certain prior patents. This motion was denied by the primary examiner. The interference came on for hearing before the examiner of interferences, and a judgment of priority was rendered in favor of Midgley. Mell appealed to the board of examiners-in-chief, where the decision of the examiner of interferences was affirmed. Mell then appealed to the commissioner of patents, where the case was set for hearing on October 1, 1907.

Continuing, Judge Van Orsdel shows that on August 30, 1907, before the final appeal could come before the commissioner, a successor of the first primary examiner to pass on the case, requested jurisdiction of the interference for the purpose of considering the patentability of the issue. On each appeal, Mell had insisted upon the non-patentability of the rim in view of a prior patent to one Harris, to which he referred specifically in his first motion before the primary examiner to have the interference dissolved. The request of the primary examiner having been granted, the latter took Mell's view and declared the invention unpatentable, basing his decision on the Harris patent, in spite of the fact that this patent had been considered not only by his predecessor but by the examiner of interferences and the examiners in chief, when Mell's motion and appeals had come to them.

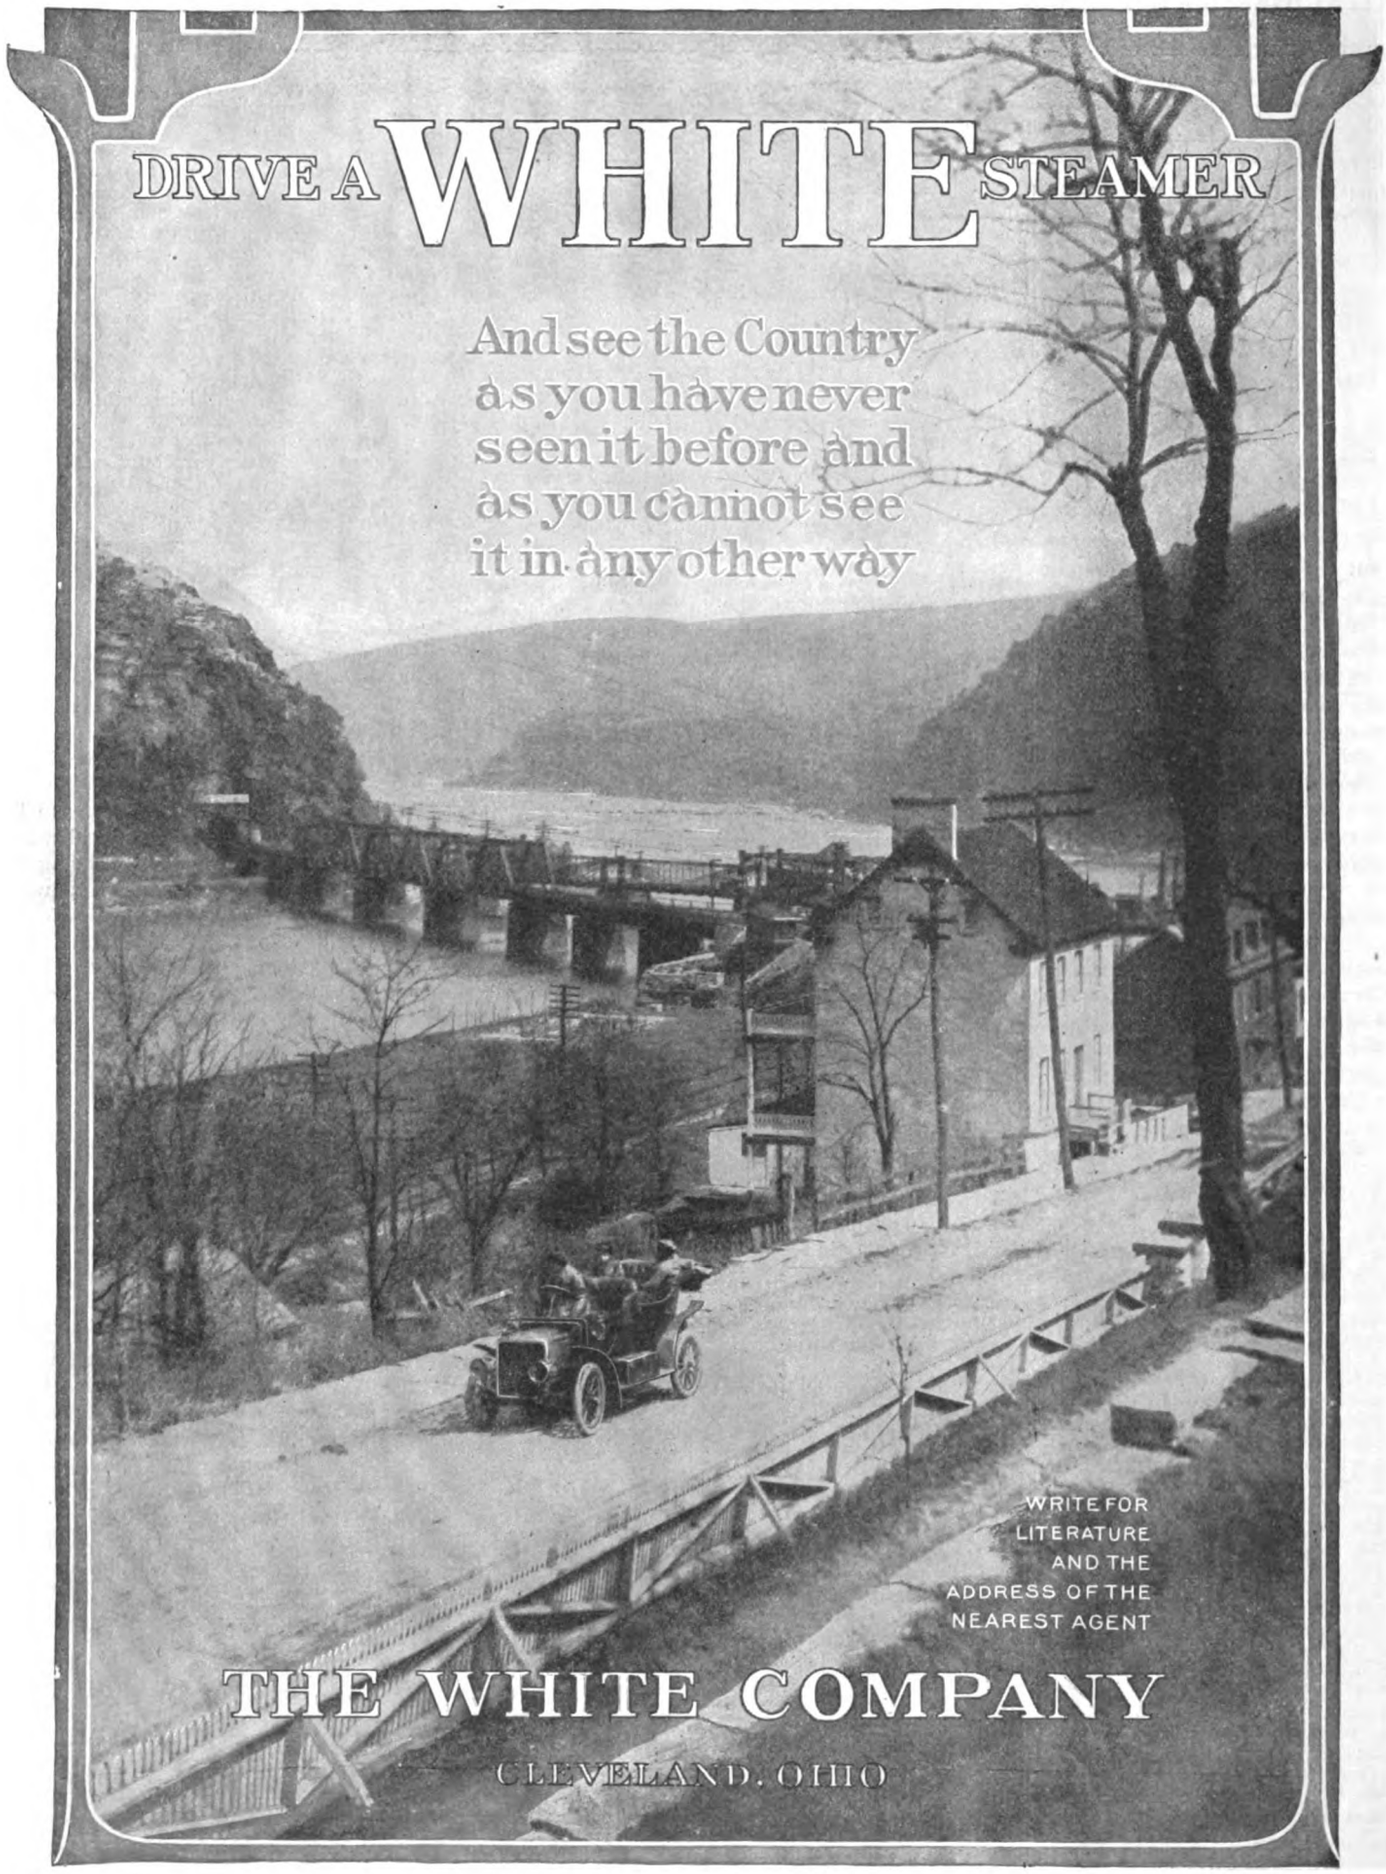
Midgley then petitioned the commissioner of patents to set aside the primary examiner's decision and to restore the case to the condition it was before, ready for a final appeal before the commissioner as to priority. This petition was granted and the case on appeal came for a final hearing, which on December 6, 1907, resulted in the commissioner affirming the decision of the examiners in chief and indicating both the validity and priority of Midgley's patent claims. Mell filed a motion for a rehearing, urging that the commissioner had exceeded his authority in setting aside the decision of the primary examiner. This motion was denied, whereupon he took his appeal to the court.

We are not required to pass upon the regularity of the action of the commissioner in this proceeding, the court explains. That question is not before us for consideration. The patentability of an invention is a question to be determined by the Patent Office and not by this court upon appeal in an interference proceeding. There are two reasons why Mell cannot be heard to complain of the order of the commissioner; first, because it was his appeal that was reinstated, and the order reinstating the appeal must be presumed to have been for his benefit, and, second, because he is not in a position to raise the question here presented. At the time the Commissioner made the order complained of, Midgley had a judgment of priority in his favor. Mell, in the fact of that judgment, was in no better position to raise the question of patentability than that of a disinterested party. It is well settled that a disinterested party is never in a position to raise such a question. The commissioner is charged with the duty of representing the public interests in the issuance of a patent, and, when he has declared an invention patentable, a mere disinterested party cannot question his judgment. This being true, the reference of the question of patentability to the primary examiner, so far as Mell is concerned, amounted to nothing more than a discretionary move on the part of the commissioner, presumably for the purpose of gaining further information, and, when he again took up the matter of the appeal from the board of examiners-in-chief, whether regular or irregular, a question upon which we express no opinion, he simply resumed consideration of the only issue before him in which Mell was entitled to be heard, namely, the priority of invention. Upon that question alone he passed, and that is the only matter before us for consideration.

All the tribunals of the Patent Office found in favor of Midgley. Mell failed to establish any date prior to Midgley's filing date, and there is no hypothesis upon which a judgment in his favor could be based. We find no reason to disturb the decision of the commissioner of patents. The judgment is, therefore, affirmed.

Cartercar's Organization Changes.

With its removal from Detroit to Pontiac, Mich., the Cartercar Co. has chosen a new board of directors, so that the board now includes William H. Dawson, A. G. North and H. G. Hamilton, of Pontiac. The latter is secretary-treasurer and general manager of the Rapid Motor Vehicle Co., with which the Cartercar Co. will be closely allied. R. A. Palmer, in addition to being secretary, will continue as general manager under the new arrangement, having acted in that capacity when the concern was under its old name of the Motorcar Co. The president, Frank T. Caughey, indicates that the new plant was acquired through an amalgamation with the Pontiac Spring & Wagon Works which formerly occupied the factory and the principal stockholders of which were willing to abandon the horse vehicle business to engage in automobile manufacture. The old Motorcar plant at Detroit has been sold to the Constantine Motor Car Co., of Constantine, Mich.



Hotel Man Heads a Cab Company.

After a legal fight, the Hotel Knickerbocker, of New York City, has succeeded in obtaining a cancelation of the permit of the New York Taxicab Co. to stand its cabs about the hotel, and wil hereafter be served by cabs provided by the Universal Taximeter Cab Co., a newly organized concern, of which James H. Stack, the manager of the hotel, is the president. Associated with Stack are John H. Naughton, treasurer, and John F. Mulgrew, secretary. Fifty cabs are being built for the new company in Boston, after which larger lots will be produced. The machines have 20 horse-power, four cylinder motors, and are of the laundaulet type.

St. Louis Selects Show Dates.

St. Louis has decided on February 15 to 20 for its automobile show dates. The local Automobile Dealers' and Manufacturers' Association has secured the Coliseum building for the purpose.

Diversity in Automobile Design.

It is now at least two years since it was agreed by nearly all the self-styled critics of the industry that the point of almost-finality in design had been reached, and that from that time forward, little in the way of novelty or important "trend" was to be expected. This was a true forecast in respect to the adaptation of the basic principles involved, but little more. For though the typical car of given weight and power has undergone small alterations during the last couple of years, and stands to-day, as it did at that time except in the matter of the minor changes which are annually reported, still the changing conditions of the market which have altered the status of such a car—no matter whether it be small or large, have served to change the method of its design and construction not a little. Indeed, the deadly sameness which was foreboded appears even further off now than it did when the forebodings first were heard—that is to say, considering the broad purpose of the machine, as well as its technical details.

Of the changes in market status, perhaps none of recent recognition is of more significance than that which is now in progress, in which the medium powered and small car is being elevated from its secondary position to one of primary importance in the field. For just this is taking place, rating importance in terms of numerical output. Built with an eye to the price-inducement feature, in quantities, and for middle-class consumption, the original medium and small sized car was not given the attention, neither by the draughtsman or the production engineer, which its real worth demanded. This fact was not recognized at first, and perhaps the abrupt decline in the popularity of the small runabout of a year or two ago, may have been influenced quite as much by this cause as any other. The establishment of thoroughly accepted lines of good practice, however, and the development of well tried rules of construction in the better equipped factories, made possible the production of machines of reduced size in which practically no sacrifice of structural excellence existed. The possibility of stagnation was thus warded off by the demand for miniature reproductions of the better known types of car, and that demand is growing at a stupendous rate just now.

Another evidence of the natural opposition to the establishment of stereotyped designs is found in the present status of the six-cylinder car. Not lending itself readily to the purposes of the very small car, this type of machine is necessarily confined to machines of a rather limited power range, or that upwards of the thirty rating. Hence the maker of six cylinder machines who desires to engage in the swift competition for supremacy in the hitherto despised small car field, must perforce return to two or four cylinder practice. In one notable instance, this has been done by a foreign maker whose previous abandonment of twin and quadruple types was the occasion of considerable stir at the time. As if to ward off any possible suggestion of stagnation, this particular maker now is advertising a line composed of no less than eight chassis of different powers, prices and sizes.

Thus the oscillations of the market, which, though controlable to a degree are by no means entirely under the sway of the builder, tend to induce corresponding changes in the structural features of the product. In every case the structural changes which they induce are influenced by the effects of previous swings of the pendulum. In no case does an apparent return to former practice entail an absolute repetition of discarded designs. At the same time, instead of the promised concentration of types and models to one or two accepted styles, as had also been forecasted, the general purposes of the available products continues to manifest a wide degree of variety. Finality is still a very long way off.

Motor Buggies and Their Problems.

During the brief period of its existance as a distinct type of automobile construction the high wheeled motor buggy has developed to a point where its makers have discovered—much to their surprise—that far from being the simple proposition it appears from the structural point of view, it entails sundry problems which are of tremendous importance in their effect upon the success of the vehicle. Superficially, it would seem that the mere adaptation of mechanical propulsion to the practically unaltered buggy type of vehicle should carry no serious difficulties in its wake. Actually it has been found by the more successful and studious of its adherents, that it presents a number of characteristics which are not to be found in either the carriage or more conventional automobile fields. In a word, the hybrid type, has evolved into an entirely new entity which though it retains the outward semblance of its forebears, yet possesses a number of important eccentricities of its own.

One of the most important of the problems encountered has been, and still is acknowledged to be that of retaining the adjustments of nuts and bolts. The combined influences of the short wheel-base, high-wheels and solid tires which are characteristics of the motor buggy, produce a far greater amount of vibration than is encountered in the more ordinary types of automobile. This, coupled with the fact that the lighter bodies used, require lighter spring suspension—this also tending toward the same result unless special provision is made against it—causes even the most trustworthy forms of locking nut to give way at times, and results in a rattling loose of all sorts of fastenings which apparently have no cause to be disturbed. In consequence of this unfortunate trait, the products of the more careless and hasty builders have not invariably fared as well as might

Digitized by Google

have been expected, and in the heated rivalry which exists it is freely charged by several of the better known makers, that their less cautious competitors are responsible for no small injury to the prospects of the trade. At all events they acknowledge that the problem of properly insuring against rattling, is one of their most serious difficulties.

Similarly, the spring suspension is entitled to a greater amount of consideration than is invariably accorded it by these makers, while the racking effects resulting from the tractional and torsional strains of the power plant upon the carriage gear are not always appreciated to the full extent which they merit. Furthermore, it is found that where all these points are taken seriously into account and as wisely provided for, the resulting construction is much more massive than that of the conventional type, so that the really cautious maker finds himself in the unfortunate position of having to combat the arguments of his competitors against the adoption of "needless weight."

Thus without in the least questioning the utility of the buggy type of vehicle, or its undoubted strength in its own peculiar field, it is beyond question that the makers of that restricted class are struggling with a very critical situation just now, and one which bodes no good to their own interests unless they act with proper wisdom in the construction of their product. It has been proved that the ordinary carriage gear is not sufficiently staunch to withstand the stresses of motor propulsion for a proper length of time. Further, it has been found that special provisions are necessary in suspending the body and securing the fastenings of all parts if adequate life and mileage service are to be obtained. Recognition of these facts and proper steps to safeguard the product must become general to the trade, or the market will become surcharged with vehicles which are practically unsalable, and the demand for them will fall as suddenly as it arose.

"Style" and Emotional Influence.

Wide differences exist in many cases between what men say they want and what they really want, and it is well for the manufacturer endeavoring to cater to any large public demand to recognize the phenomenon. The deception attempted in this direction by buyers is often unconscious, resulting from some pose or affectation of the mind adopted for purposes of conforming to recognized standards of "common sense" or business acumen. Perhaps the most cited example of the disparity between expressed preference and actual selection is the universal instance of the dissimilarity of the woman verbally pictured as the ideal and the girl who gets the wedding ring, but the daily affairs of commerce provide equally convincing proofs of the fact that the ordinary human being is not so absolutely and abstractly utilitarian as he would have one believe, and that simple emotional influences exert great power.

Automobile buyers as a class assume an air of critical inquiry into the respective mechanical merits of the machines that are presented to their consideration, suggesting the idea that their ultimate selection will be made strictly on that basis. In a large measure it is true that the design and constructional features are gone into very thoroughly by the present day purchaser, the growth of technical knowledge and understanding having brought about this result. But mechanical excellence in proportion to price is not alone the determining factor in their choice, though it may be the preponderating one.

For the majority of people there is a distinctly emotional background and aspect related to the purchase of a motor car, and while prudence may suggest a careful reckoning of the cost and a cautious effort to insure a full value for the money expended, yet the governing cause of the purchase is usually an emotional one, either purely selfish or of sentimental origin, as the buying of automobiles from purely practical and economical reasons is, as yet, rather limited. But although the buyer may be getting a car to gratify his own fancy or to make his family happy, he cannot reasonably be expected to confess, even to himself, that what he really is after is as much splendor and show as his pocketbook can afford and his good taste will tolerate. Feeling safe in shopping among makes of cars bearing good repute, his examination of the mechanical features often is superficial, and while he may have distinct predilictions for a given number of cylinders and certain specifications concerning the seating capacity he desires, the less obvious features of the construction do not greatly concern him nor affect him in his course.

What in boyhood was his pleasure in bright red paint on his wagon has probably been modified to a desire for "style," the elusive and transient nature of the latter giving it possibilities for wide interpretation. If he be seeking a runabout he may incline toward a racing machne effect in factory gray with unfinished woodwork, mutely hinting at a costly and powerful chassis beneath the pronouncedly modest exterior, or his early affection for brilliant hues may still remain with him, so that the appeal of a touring car chromatically graduated to his liking is practically irresistable. Then again, such subtle forms do conceptions of "style" take that the mere presence of a famous maker's name on the hub caps, together with the incidental features of appearance proclaiming the car's distinguished origin, may meet his secret views as to what is desirable, whether he be familiar with the character of its construction or not.

Conspicuous examples exist of motor cars of the highest mechanical excellence that could not be sold because the maker refused to make any compromise to style, through a mistaken idea that the public would soon learn to make its choice without regard to externals. The public itself, with its show of serious investigation and its patter about engine theory, chassis structure, and the like, lent intellectural support to the belief, but the financial support went drifting away to where buyers saw the glint of brass and color and still had reasonable ground for confidence in the mechanism. Protestations by buyers that it is solely a superiority in efficiency and economy that can win them should not lessen the manufacturer's keenness in selecting for his models those combinations of curves, colors and fittings which will appeal to the sense of style and be suggestive of opulence, pleasure and speed.

COMING EVENTS

October 24, Los Angeles, Cal.—24 hours race.

October 24, Long Island—Vanderbilt Cup contest.

October 31, Philadelphia, Pa.—Automobile Club of Philadelphia's sixth annual tour for the Brasier Cup.

November 3, New York City—New York Automobile Trade Association's postponed hill climb, Fort George hill.

November 23, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

ALL READY FOR THE FOURTH VANDERBILT CUP RACE

Seventeen Entrants to Start—Two Withdraw at the Weighing-In—Danger Spots on the Course Made Safe—Practice Spins Promise Speed and Result in Only One Accident—Arrangements for Transportation and Accommodation of Spectators—Irish Volunteer Regiment to Assist Guarding Course.

In an array suggesting aptly the full panoply of war, the 17 contestants who are to dispute the fourth contest for the Vanderbilt Cup are encamped about the battle ground of next Saturday's tournament. During the past fortnight they have lived beside the course, trying out their cars in the early practice hours of the morning, adjusting and overhauling them by day. With their mechanics, assistants, supplies, parts, tools and accoutrements, they have been in arduous training for a race which takes on double significance because it is the first of its kind in two years, as well as the first in which the speed possibilities of the new Long Island Motor Parkway will be tested to the full by a large number of racing cars in unhampered flight.

The Long Island Sweepstakes race of September 10th furnished a promising introduction to this event, though the rates of speed then developed were not prodigious as racing speeds are rated. Later efforts in practice have proved that better times may be looked for in the Vanderbilt contest itself, while the number of cars in the race, together with the fact that they are all of high power, increases the probability of a good contest. From all that may be gathered of the cars, the drivers and the course, however, there is little basis for a prediction that excessively high running speeds will be attained, although ample prospects are held forth for stiff competition and a race full of incident.

Of the 17 cars which will start in the contest, nine are of American manufacture. Of the foreign contingent, three are German, three French, and one Italian. For the first time in its brief, but eventful career, the cup will become the subject of individual instead of team competition. This feature lends added zest to the affair. For with the disappearance of the team status, each entrant is thrown completely on his own resources, and no opportunity is offered for the schemes which have been worked to advantage in several of the great international races between representative teams where the competitors drove according to a preconcerted plan—some for speed, some for endurance only, and others with the object of taking advantage of their own particular skill in negotiating difficult spots in the course.

According to tradition, the race is scheduled to be started at daybreak. The cars will be dispatched at one-minute intervals and unless the first round proves an unfortunate one for Car No. 1, the Locomobile machine, with a clear road before it should pass the grandstand within three or four minutes after the departure of the last car from the starting line. As in the previous Vanderbilt contests, William K. Vanderbilt, Jr., will act as referee, despite the fact that this year he has a personal interest in the outcome of the race in the performance of his own car. Also, as in previous contests for the cup, Fred J. Wagner will slap each of the drivers on the back as he charges them with his energetic "Three-two-one-go!"

For those who desire to witness the race, ample provision has been made both by the Long Island railroad and the management of the Long Island Motor Parkway. On Friday night the grandstand will be illuminated by calcium lights, while the gates will be thrown open at midnight, when ticket selling will begin. Trains will be started from Long Island City and Brooklyn at all sorts of unearthly hours and will arrive in the same sequence in which they are scheduled to start—provided that the ever unreliable crowd furnishes the necessary

CHEVROLET, MATHESON

RYALL, MATHESON

encouragement to the officials of the railroad.

For those who motor to the course ample parking arrangements have been made. Indeed, to assist in that stratification which is a necessity in all momentous gatherings of the sort three distinct grades of parking space have been provided by the thoughtful A. R. Pardington, general manager of the Parkway, and his assistants.

Class "A" spaces, are on the south side of the grandstand stretch, running down on that side of the stretch for more than a mile. Purchasers of these parking spaces may enter the course at any time of the day and leave at their pleasure. The privilege of this section is disposed of at the modest rate of $50 per car.

Class "B" visitors will be on the northern side of the grandstand stretch. Holders of parking spaces in Class B will be required to take their positions before the race starts and their cars cannot be moved until after the race is declared off by the referees. As being a less advantageous position in some respects, this section is let at only the modest price of $25 per space.

Purchasers of "general admission" tickets under the class "C" designation, however, which cost only $10, have the advantage of being able to select their own parking spaces, and may attain to the Class "B" privilege by the payment of an additional $15 if they so desire and are able to find spaces unoccupied. In order to reach either of the sections or the parking spaces beside the course and within the right of way, it will be necessary to go to one of the three toll lodges, which are located, respectively, at Bethpage, Massapequa and Meadow Brook.

In addition to these purchasable coigns of vantage, sundry private enterprises undertaken by the local residents along the highway sections of the course provide ample space at modest rental figures, while further opportunities to view the race are offered at the numerous intersections of the course with the many highways of that section.

The Automobile Club of Hartford, which will tour to the race in a caravan of 70 cars, more or less, has engaged a big parking space near the grandstand. The Long Island Automobile Club has a generous section in reserve for its members. The White, Stevens-Duryea, Peerless and Maxwell branches and agencies have all arranged for parking spaces for their customers.

For the safeguarding of the course provision has been made for the reinforcement of the Nassau County constabulary, the Pinkerton men and the special police of the Long Island railroad by a troop of the semi-military, 600 strong, in the Irish Volunteers. This doughty band goes into camp to-night (Thursday) at Hicksville, and on the morning of the race will be distributed over the course in generous numbers. It is noteworthy that this is the only body outside the State militia which is permitted to carry arms, though how freely they will be permitted to use their weapons in keeping miscreants from encroaching on the course has not as yet been announced.

DENNISON, KNOX

BOURQUE, KNOX

Of the course, considered as a source of possible danger to the contestants, it may be said that while no definite guarantee of satisfaction can be held out to them, those sensation seekers who are desirous of posting themselves at points which will be the scene of possible bloodshed may choose from a number of localities which the drivers and watchers who have been studying the course for several days or weeks have picked out as perilous.

Of the two most conspicuous trouble zones—that at Jericho where the Oyster Bay road joins the famous Jericho turnpike, and the Colyers Corner turn—the latter has received the attention of the Cup Commission's road makers and has been rebanked during the week, while similar attention has been paid to the only grade crossing on the course, which is at Locust Grove. The Jericho corner, however, remains somewhat a menace, and has already been the scene of at least two accidents—one during the Sweepstakes race, and the other during the practice hours of last Sunday. Early this week it was reported to be in a badly rutted condition, though there is small doubt that it will be repaired before the commencement of the race.

According to a driver in former Vanderbilt contests who is at present in charge of one of the camps along the course, the most dangerous point which the drivers will have to consider is the grade crossing just mentioned. Here, although the danger from trains has been practically eliminated by the establishment of a signal system, the difficulties arising from a combination of a down grade, an "S" turn, and an oblique crossing of the rails, are thought to be far from conducive to the safety of the drivers.

In the course of the practice try-outs, which have assumed important proportions during the week, the usual foggy weather conditions have prevailed to a disconcerting extent. The usual quota of "clockers" have sat religiously upon the fence rails along the course, however, and some truly remarkable results have been obtained, though in one or more instances cutting of the course by drivers anxious to make a reputation was reported—this being a well authenticated method of obtaining publicity on previous occasions of a similar nature.

According to the unofficial reports which emanate from this source, George Robertson, who is to pilot the second Locomobile entry in the race, is ambitious to do at least one circuit in 18½ minutes, which would mean a speed of 78 miles an hour on the average. His best round up to the present, however, is reported to have been 20 minutes flat, though taken from a standing start. Ryall, who will handle the smaller Matheson, was credited with a 20:30 lap on Tuesday of this week, and incidentally has earned a reputation for reckless handling of his machine. Haupt, of the big Chadwick entry, also has been set down as careless of his own safety in his desire to gain high speed. Times of 21:00 and 20:40 are reputed to have fallen to his lot.

Among the drivers of foreign cars, Strang

HAUPT, CHADWICK

BASLE, KNOX

Digitized by Google

is being watched with interest. He appeared for the first time on Tuesday morning, but did little or no spectacular driving. Kilpatrick also appeared on Tuesday with the Hotchkiss car, but failed to develop any remarkable showing. An incident of the practice on the same day was an impromptu bout between Florida and Robertson in the Locomobiles, and Keene in his Mercedes. The latter had something like a half-mile start over the others, it was said, but was headed after a mile or so of running. Shortly afterward, he withdrew from the course.

Of the other two Mercedes drivers, as Grand Prix racer, which was known to be over the limit of 2,644 pounds, and the B. L. M., which failed to appear. As most of the cars were built prior of 1907, they had little difficulty in squeezing through. In the case of the Acme, it was necessary to remove some of the gasolene from the fuel tank, while the Isotta had to be stripped of its tire irons before it was admitted. The larger Matheson also had to be lightened somewhat, it was said, as did the Chadwick. In several other cases it was found necessary to remove part of the fuel supply. The Renault and Robert Graves' Mercedes were permitted to weigh in this morning, though

"Grandstand," with the intention of taking the eight o'clock train out.

The man at the gate, when asked if the train was ready, (it was then 7:55) replied: "Naw, it don't go at eight. The race is a frost and the company is plum disgusted. They're going to send out the specials when they get enough people here to pay for the cost."

There were not enough people for the "company," and by the same token, there were not enough for the crooks. So we had to wait until eight fifty-five, and then the proper number had collected to satisfy the economical scruples of the train despatcher,

KILPATRICK, HOTCHKISS

STRANG, RENAULT

Stricker suffered a setback on Sunday at Jericho when his car went wrong at the turn and crashed through the fence after being ditched. Murray, his mechanic, was seriously injured and the driver himself was so badly shaken up that he has not again appeared on the course, although it is said the car was not injured beyond the possibility of being repaired in season for the race. Luttgen in the third of the German delegation, was out on Monday, and on Tuesday was timed in 23 minutes for one lap.

Few changes have been made in the list of drivers since it was first announced a week or so ago. Basle, who had been nominated as the driver of the first Knox car, was replaced by Albert Dennison, who is a factory man. Florida, who had been nominated to drive the No. 1 Locomobile, was in question for a time, according to report, but apparently proved his ability to perform creditably, for his position in the race has since been confirmed. Some doubt which had existed as to who was to pilot the third of the Thomas entries, was, of course, removed, when the largest of the cars was withdrawn at the weighing-in.

Incidents connected with this formality, which occurred at the Garden City garage yesterday morning, resulted in the withdrawal of two of the candidates—the Thomno official statement was obtainable to the effect that either of the three would fail to compete.

Sidelights of a Big Contest,

Like the proverbial county fair, much of the interest of a popular event such as the Vanderbilt cup contest, hinges about the human element of the crowd. "Side shows" in the accepted sense may be lacking, but the spirit of the side show—the curiosity of the people on the one hand and the eagerness of persistent manipulators of the agile little pea and the elusive card to assuage it, on the other—is to be found in all its thrift and persuasiveness. Former Vanderbilt races have set a mark for enterprise of this sort, and the experiences of many at the recent Long Island Sweepstakes races go to bare out the probability that the forthcoming event will be in no way an exception to the rule. It is on this account that I issue solemn warning to all who intend to witness the race—particularly if they are to journey down to the Parkway by way of the Long Island Railroad—to be constantly on their guard. Otherwise they may fall heir to some such fate as was mine at the recent Sweepstakes. Which brings me to my tale.

Saturday morning I hastened to the Flatbush Station of the Long Island Railroad and bought a round-trip ticket for the and also to let the "gang" slip in and get busy.

By the time the conductor got to our car and the passengers felt for pocket books where tickets had been placed, the results of the first haul came to light, and no fewer than ten victims had been "touched." Several watches also went, and a few scarf pins changed hands. The train was supposed to be a through express, and indeed it passed Jamaica, but came to a dead stop at Floral Park, where we were ordered out for a change.

The order was well put, because it was there that several more wallets, watches and pins were changed from their rightful owners' pockets to those of the unrightful. By this time it might have been supposed that the little company that made up the train load would have been sufficiently "wise" to take care of what had not been lifted, but not so.

At the terminal streak of ashes, politely known as the station for the grandstand, the usual rush to get out of the cars occurred. There were less than two hundred on a train that would have accommodated a thousand, yet the two hundred pushed and pulled as they will when the big crowd goes on the 24th—and then what golden opportunities for the light-fingered gentry! For had the gang "lined out" the rush play

Digitized by Google

they could not have done better than the people themselves. The thieves just worked them for another bunch of "leathers," "tickers" and "sticks."

The run to the Motor Parkway side is over grassy plains, go as you please. For no road or path has been made, and after covering a short half mile you haul up against a five-foot cattle wire fence, which bars further progress.

This wire is stretched along both sides of the track, separating you from it by several feet, which for the safety of the race drivers is the finest sort of thing imaginable, and it nearly served its purpose on that occasion. But it did even more than that, as my further experiences taught.

By way of carrying out the impressiveness of the occasion, the Long Island Railroad provided a squad of nicely uniformed men in brown and gilt, who were conspicuously labelled "Police;" and stationed them at Floral Park and at the grandstand station. Just why they were at either place—unless, indeed, for purposes of ornamentation—was not shown. For they did nothing but pose, could not answer a single question when asked, and actually played into the hands of the crooks. In fact, everything seemed to be favorable for the business of the bands who flocked to the race—even to the fencing arrangement.

One of the Sunday papers observed that "As usual, the gamblers were very much in evidence."

You bet they were in evidence. If the Sheriff of Nassau County and his band of comic opera police, with their pie plate badges, had been on to one-tenth part of the job, they would have known that the groups of shifty-eyed vultures who openly pursued their three card and shell games right under their noses, did so not for what they hoped to fleece from the public in the run of the game, but purely to get the crowd so interested that the pick-pockets could work.

LYTLE, ISOTTA

There was plenty and more for those "police" to do had they been out where the doings were, but they were not. The five-foot cattle wire fence heretofore mentioned, kept the crowd outside the grandstand, safely away from the cement motor way, and at the same time kept the "police" safely away from the crooks, so that even had one of the officers had a mind even to speak to one of them he could do so only through the meshes of wire. The police were all inside the fence, and as they probably had nothing to steal, the crooks remained on the outside. Thus you see the conditions in the neighborhood of the grandstand are ideal for the business of the underworld, and it will be prepared to take every advantage of the fact on the 24th.

The fake games of no fewer than fifteen bands were working all the time, within a radius of a city block, and right under the eyes of the police, who were so thick along the track that they almost held each other up. At one time when the hands of the clock neared noon a steady line of star badges glistened along a path trodden by the feet of the wearers from the track to the pie tent, and then the so-called Nassau police had to pass right through the "monte men" and "shellers" in order to reach their destination.

When one remembers the clam-like innocent faces of these arms of the rural law, it is difficult to think that "graft" could have reached them in the fastnesses of their happy, little Long Island homes. But a few remarks let fall by one lean and hungry wolf seemed to indicate that such might be the case.

A chap was walking away from a group that was trying in vain to pick "the red card," when another chap called to him:

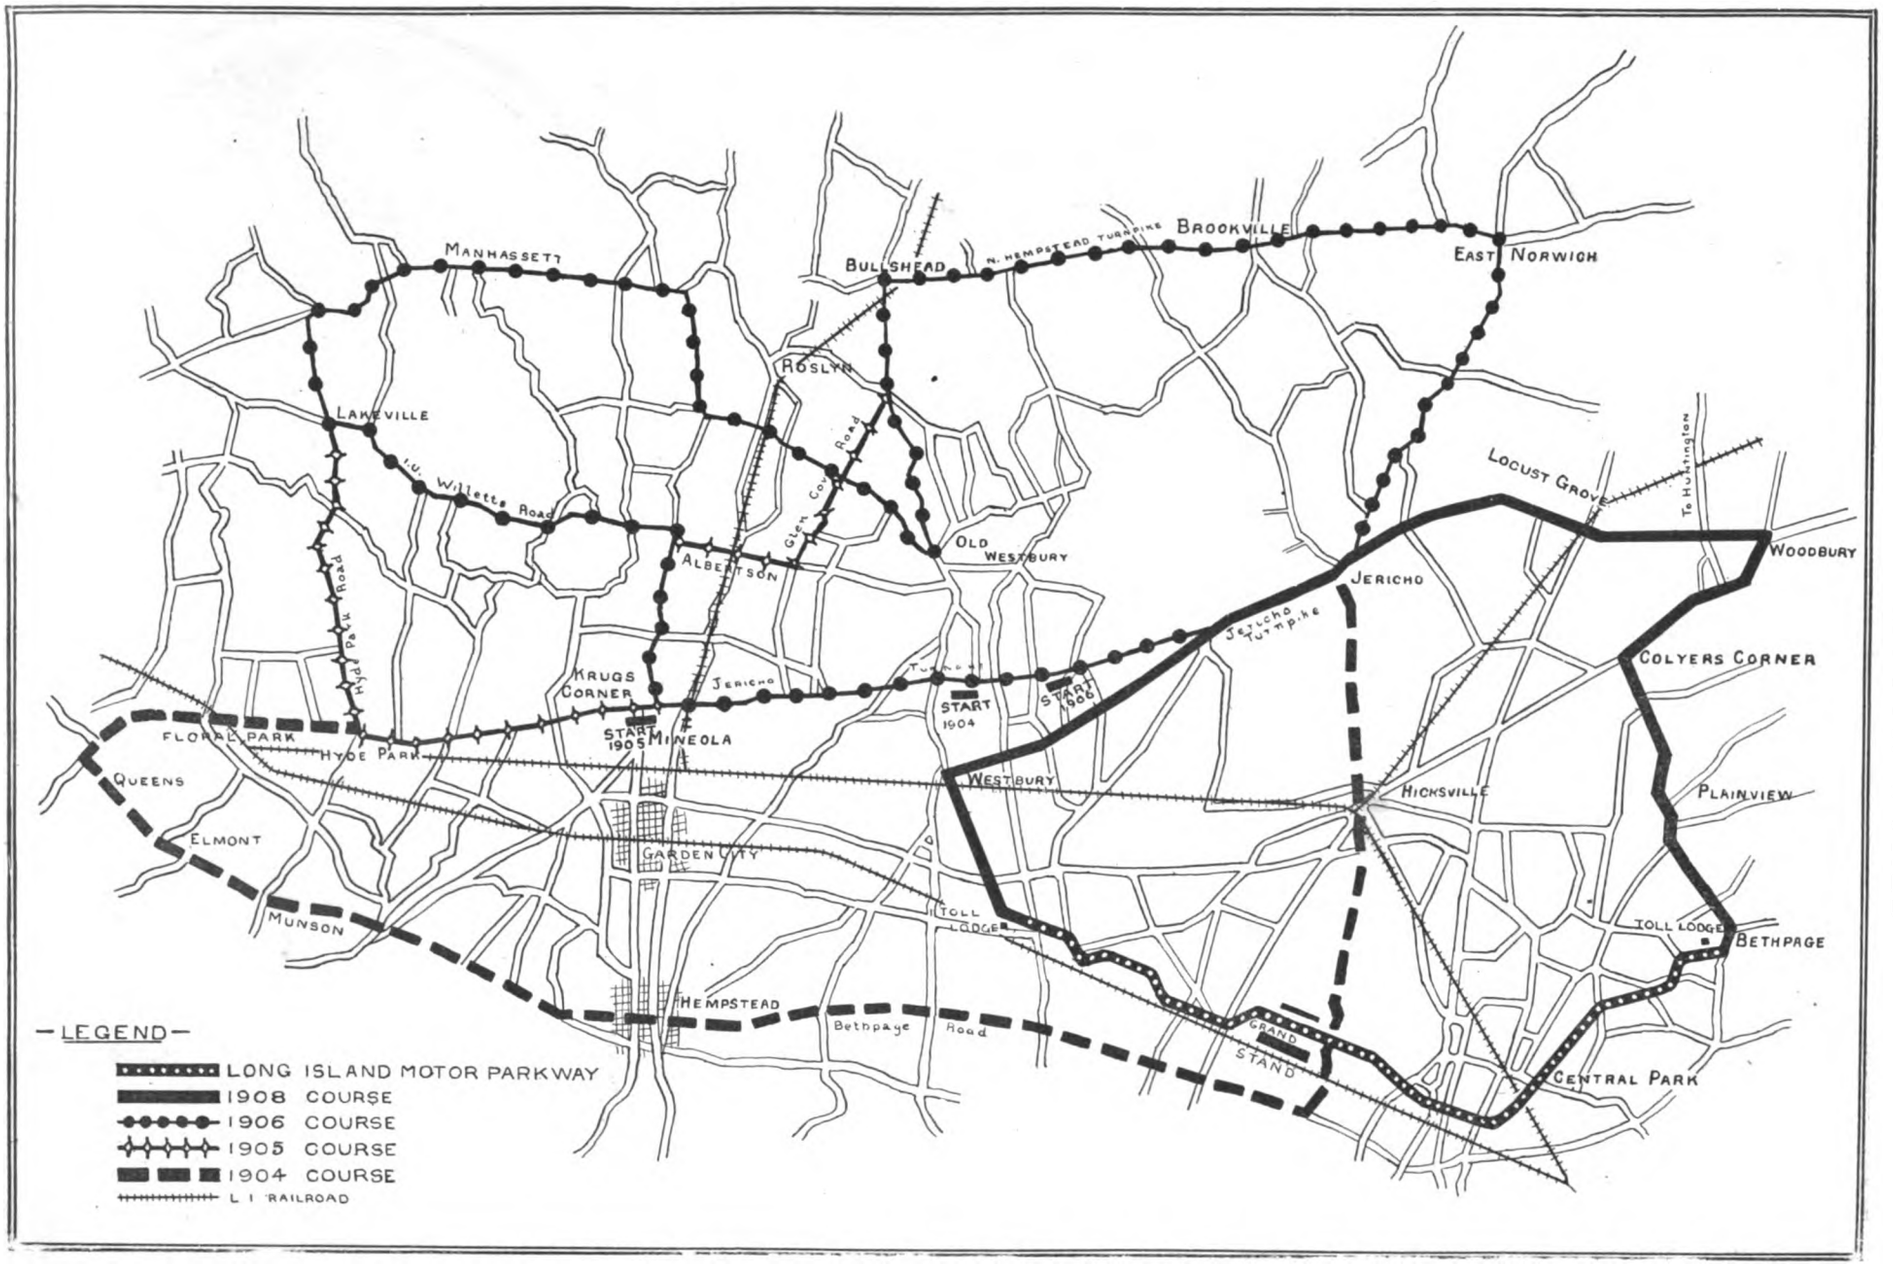
"Hey, Beef, where you going?"

Beef said he had enough.

"Too many 'Bulls', he said.

"Bulls? Hell," said the other. "Get to work. Work when we have a bunch like this, and don't 'slough.' Don't you know we have protection?"

This word "protection" was heard several times thereafter. And whether there was anything of that kind or not, the place was overrun with all kinds of bad men, and they worked the comparative handful of people present to a finish.



Further, they will be on hand bright and early on the 24th, and play every point from 34th street to the grandstand and return. For, mind you, this is a true story, and here is the secret of it.

The writer went through all he has recounted, and heard and saw a lot more, and on top of that the wolves "got him" at the last moment. At Jamaica, either a local hand, or part of the organized gang, was

MAP SHOWING THE VANDERBILT CUP COURSE FOR 1908 AND THE COURSES OF THE THREE PREVIOUS CONTESTS.

The 1908 course, as shown in this map, traverses a section of Long Island lying largely outside and to the east of the sections traversed in either of the three previous years, when the race was held. It will be seen that it covers only a short stretch on the Jericho turnpike, as compared with the older courses, this stretch—extending westward from Jericho—being common to the four. The new course is touched at only one other point by any of the other courses, that of the year 1904 crossing at a point just east of the grandstand, which is located on the completed portion of the Long Island Motor Parkway. The length of the course is a trifle over 23.4 miles and the completed portion of the parkway is about 9 miles in extent.

Digitized by Google

in waiting and got to work when the change of cars was being made by those passengers who were bound for Brooklyn instead of Manhattan. There was not much of a jam, but it was enough for the purposes of the talent, and when one after another in the Brooklyn bound train felt for their wallets, wail after wail went up, "I've been touched." And be it spoken in shame, my voice was one of the first to be upraised.—B. M.

The Cup and Its History.

The inauguration of the Vanderbilt Cup contest occurred in June, 1904, when William K. Vanderbilt, Jr., pioneer motorist and one time holder of the world's mile record, donated the trophy to the American Automobile Association. By the terms of gift it was to be competed for annually under the auspices of the American Automobile Association, or its successor, at a distance of not less than 250 miles nor more than 300 miles, and over the highway—it being provided that no part of the course was to be upon a track. Those eligible to compete were to be all clubs recognized by or affiliated with the A. A. A., or similarly recognized by the Automobile Club of France. During 1904 and 1905 it was specified that the race must be run within the United States. Subsequently it was provided that it might be contested in the country whose officially constituted representative then held it, practically at the option of the holding club.

By the terms of the "Treaty of Peace," signed September 17th, whereby the A. A. A. relegated all claim upon racing events of an international character to the Automobile Club of America, provision was made for an alteration in the status of the famous Cup from that of international to national significance. Although the exact terms of the "revised" deed of gift by which the donor confirms the arrangement have not been made public, it was stated that after this year, the two cups (the Vanderbilt and the Grand Prize of the A. C. A.) "are to be deeded to an independent racing association and are to be contested for annually, the Grand Prize Cup as the international trophy and the Vanderbilt Cup as the national trophy."

The Vanderbilt trophy itself is a magnificent piece, standing about two and one-half feet high, and measuring eighteen inches across the brim. On one side of the bold relief is shown the figure of a racing car in full flight upon a beach course, the figure bearing a suggestive likeness to the donor himself seated in the car with which he captured the old world's record of 39 seconds for the mile, on the Ormond sands. Upon the other side is a legend of presentation mentioning the American Automobile Association as recipient and stating that the trophy is to be competed for annually "by cars under 1,000 kilos." Save for a heavy laurel wreath surrounding the upper part of the bowl and a little fine beading around the base, the cup is bare of ornamentation and elegant in its simplicity. Three times contested, it has been won as many times by representatives of France.

The 1904 race, which was run on October 8th, saw 16 starters composed of four teams representing the United States, Italy, France and Germany. Thre were five American cars, one Italian, six French and four German cars. No elimination trials for an American team were necessary. George Heath, an American, driving a 90 horsepower Panhard, as a member of the French team, won the cup for France, after covering the 284.4 miles course in 5:26:45, at an average speed of 52.22 miles per hour. Albert Clement, of the French team, piloting a Clement-Bayard, was second and Herbert H. Lytle secured a place for America by winning third place.

This initial contest for the cup was run in 10 laps over a 28.4 miles circuit, starting at Westbury and running in an approximate triangle with Jericho, Plain Edge and Queens as corners, the turns of which were all taken "right handed." Heading eastward from the grandstand along the Jericho Turnpike to Jericho, the cars switched southward to the Bethpage Road, turning in a westerly direction towards Hempstead, where was located a control. From Hempstead the route was northwest to Floral Park, and back into the Jericho turnpike. In this event, Tart, in a Panhard, made the fastest lap in 24:04, at a rate of 70.9 miles per hour.

The second contest for the cup brought a sufficient number of entries to necessitate an elimination race to select the American candidates. This was held September 23, 1905. Bert F. Dingley, with a 60 horsepower Pope-Toledo was the winner of the trial, with Joseph Tracy, in a 90 horsepower Locomobile, second. Robert Jardine, in a 40 horsepower Royal, Frank Nutt, in a 50 horsepower Haynes, and Montague Roberts, with the 60 horsepower Thomas, also finished creditably. For these, however, the racing board, by virtue of its self-constituted right, substituted Lytle, with a 75 horsepower Pope-Toledo, Walter White, with a 40 horsepower White Steamer, and Walter Christie, with his 120 horsepower front driven racer. All of these had broken down in the elimination, but the board's decision was unalterable and they were placed in the contest proper which occurred on October 14th.

America, France and Italy were represented in that event with five cars each, while Germany had but four. France again triumphed, when Hemery, in an 80 horsepower Darracq, went around the 10 laps or 283 miles of the course in 4:36:08, his time being nearly an hour better than that of Heath of the previous year. Hemery's average speed was 61.43 miles per hour.

It was on this occasion that Lancia gave Hemery a great race, the former driving a 100 horsepower Fiat, doing the sensational work of the day, when he covered the 28.3 miles course on one lap in 23:18, the fastest round of the contest.

Heath, in his Panhard, running as a member of the French team, again scored second place, and Tracy, again driving the Locomobile, was third.

The race started at Mineola and ran "left handed" along the Jericho Turnpike, bearing northwest at Jericho to East Norwich, then westward to Bull's Head; down the Glen Cove road to Albertson and along the Willetts road to Lakeville; thence back to the Turnpike.

Like the 1905 contest, that which took place in 1906 was preceeded by an elimination to determine the American candidates, which was held September 22. This event was won by Joseph Tracy, driving the 90 horsepower Locomobile, in 5:27:45, with Le Blon, driving a 115 horsepower Thomas, second, and Walter Christie, with his 50 horsepower front wheel drive car, third. These, with Harding, who drove a 60 horsepower Haynes into fourth place, and Lawell, who was fifth, with a 110 horsepower Frayer-Miller, comprised the American team.

The Darracq was victorious a second time in the final event, when in a hotly fought battle, Wagner drove to another triumph for France in 4:50⅖, at an average speed of 65.13 miles an hour. Lancia, the Italian, in the 120 horsepower Fiat, gained second place; with Duray, at the wheel of a 120 horsepower DeDietrich, third. Joseph Tracy, in the Locomobile, made the fastest lap of the day when he covered one circuit of 29.7 miles in 26:20⅘—America's only solace.

The course, which totalled 297.1 miles, covered much the same ground as that used in 1905. Starting at Westbury, it retraced the route of the previous contest around to Bull's Head turn, at which point it ran south to Old Westbury, turning at a forbidding "hairpin" corner. Thence it threaded northeastward to Manhassett and around to Albertson; then back to the turnpike at Krug's Corner.

The winners of the three previous events, their net times and average mileages per hour, are shown in the following table:

TABLE SHOWING RESULTS OF PREVIOUS VANDERBILT CUP CONTESTS

Year.	Winner.	H.P.	Car.	Length of course.	Winner's net time.	Winner's Av. m.h.p.	Fastest lap of race m.h.p.
1904	Heath	90	Panhard	284.4	5:26:45	52.22	70.9
1905	Hemery	80	Darracq	283.0	4:36:08	61:43	66.9
1906	Wagner	100	Darracq	297.1	4:50:10⅖	65.13	67.3
†1908	Lytle	70	Isotta	234.6	3:39:10	64.25	66.4

SEALED HOODS AND SHORT TALKS

Cleveland's Novel Three Days Reliability Contest—Open Air Oratory for the Benefit of Rural Audiences.

Eating some of the finest quality dust, bumping many hundred of the most prominent Ohio bumps in the vicinity of Cleveland, nine contestants started out on Wednesday, October 14, on the Cleveland Automobile Club's 470 miles, three days' sealed bonnet reliability run. The contest was held over three different circuits, starting each morning at the Forest City and returning there each evening after having covered between 145 and 170 miles. Of the doughty nine that embarked upon the three-lapped expedition, only four completed the run with perfect scores. These were: C. G. Bleasdale, driving a Maxwell; C. S. Carris, at the wheel of a Franklin, the only air-cooled car in the run; George Sperry, with a Thomas, and E. E. Ernest, Garford. This quartet acquitted itself with honor, for the run was strenuous indeed and the rules very strict. At the finish, every one of the cars, especially those claiming clean scores were put through the usual minute examination by the technical committee, every nut and bolt receiving the marked attention of the committee, nothing being slighted.

In one respect, this test was quite different from all others of the sort, for at the various towns encountered the cars were halted for ten minute intervals, while eloquent speakers, who were carried along, delivered orations on various pertinent subjects to the gathered population. All of the silver-voiced speakers received "perfect scores." The final report of the committee was as follows:

Perfect Scores.

	Per cent.
C. G. Bleasdale, Maxwell	1,000
C. S. Carris, Franklin	1,000
George Sperry, Thomas	1,000
E. E. Ernest, Garford	1,000

Cars Penalized.

C. R. Wedler, Garford Roadster	972
H. S. Moore, Stoddard-Dayton	943
J. H. Stickney, Chalmers "30"	721
S. Emerson, Chalmers "40"	†
Grant Johnson, Jackson Roadster	‡

†Withdrawn third day.
‡Withdrawn second day.

Figures in the gasolene consumption test were arrived at by a process of higher mathematics to show the pound miles per ounce of gasolene used, considering the weight of the car, the distance traveled and total gasolene used. The showing was as follows:

	Pound miles.
C. S. Carris, Franklin	338.2
H. S. Moore, Stoddard-Dayton	319.5
George Sperry, Thomas "6-40"	299.5
C. R. Wedler, Garford Roadster	286.7
E. E. Ernest, Garford Touring	281.5
J. H. Stickney, Chalmers "30"	257.7
C. G. Bleasdale, Maxwell Roadster	249.2

The cars checked out from the Hollenden early Wednesday morning and started to thread their way on a 162 miles round trip through Elyria, Ashland, Norwalk, Huron and Vermilion, at which towns the caravan paused to allow Hon. H. S. Vail to give the assembled multitude an interesting and educational disquisition on the marvelous progress of the automobile industry during the past ten years and the wonderful possibilities that the future held in store for it. He predicted an early arrival of the day when the automobile would be found desirable and useful by the great masses of American farmers. The efforts of automobile clubs to bring about fair play between motorists and farmers, and the endeavors to make the State build good roads that would be of benefit to all were explained.

This feature added to the interest of the tour in many ways, although some of the drivers grew restless when forced to wait at each control town while the lecture was being delivered. Between stops a fast schedule was maintained, forcing the cars to go as high as forty miles an hour in some stretches to make up for the time lost on rough roads. In fact, contestants complained that the time schedule calling for a 20 miles speed was entirely too severe.

Only one car was penalized on the initial journey. This was the Stoddard-Dayton, driven by H. S. Moore, who also laid the confetti. He was penalized 53 points for breaking several seals while trying to locate ignition trouble, which he later found was caused by a loose terminal screw in the coil box. A slight twist was all that was required to set the car in commission again. The intrepid Barney Oldfield's six cylinder Stearns car carried the officials.

During the second day's run, covering a triangle with Akron and Youngstown as corners, four more cars lost their perfect scores, leaving only a quartet of contestants with unblemished slates. C. R. Wedler's Garford, the only amateur entry, lost 14 points for breaking hood seals to ascertain why the engine stalled. The trouble was located in the radiator, which had gone dry. It was necessary to give it a drink twice between controls, which caused two points penalty each time. C. S. Carris, the Franklin driver who has been distinguishing himself by making perfect scores in various endurance runs, was penalized 12 points for taking on extra oil. Later, however, this was disallowed. Grant Johnson's Jackson was obliged to hoist the signal of distress when a roller bearing went wrong at Youngstown and was unable to get back to Cleveland that night. Next to Johnson, J. H. Stickney, driving the Chalmers "30," was hardest hit, when faulty spark plugs caused him a loss of 209 points.

Sam Emerson's Chalmers-Detroit "40," E. E. Ernest's Garford, the Thomas, driven by George Sperry, and the Maxwell, with C. G. Bleasdale at the wheel, came through with their tallies of 1,000 points intact.

Harry S. Moore, whose confetti car lost points on the initial trip, distinguished himself by falling into the clutches of the law at Akron. He was arraigned on two counts—throwing confetti upon the public highways and "driving at the rate of sixty miles per hour." Moore disputed the local chief of police and declared he was going considerably less than thiry-five miles an hour. He was allowed to continue in the contest when a citizen of Akron vouched for his subsequent apearance in court.

Senator P. W. Ward, W. F. and Harry Bonnell took up the prophet's mantle at each hamlet in which the tourists paused, in accordance with the grand educational campaign that the Cleveland club is promoting. At Youngstown the local automobile club gave the dusty ones a dinner, for which no little appetite had been created.

The third and last day of the 470 miles run saw four contestants finish with perfect scores. Only seven cars started on this last leg through Chardon, Painesville and Ashtabula and back to Cleveland, and three of these lost points. The Garford roadster, amateur entry, driven by C. R. Wedler, was penalized again for filling its leaky radiator; H. S. Moore's Stoddard-Dayton lost four more points for one minute's work on the accelerator mechanism, while Sam Emerson's Chalmers "40," which had hitherto had an unbroken tally, was put out of the running by its fan ripping off and punching a hole in the radiator. When the contest committee held its final meeting, it was decided to remove 12 points penalty against Carris's Franklin for taking on oil between controls, for the simple reason that it had been ascertained that other contestants had done the same thing at various times through a misunderstanding of the rules. Sundry oil and brake tests, which were to have been the wind-up of the contest, were eliminated.

New Orleans Gets the Racing Fever.

The motor racing microbe has gone as far south as New Orleans, La., and on November 7-8 a race meet is to be held at the local horse track. Lewis Strang is promised as an attraction for the event, but whether he will choose to grace the city before his appearance at Savannah some days later, remains to be seen. Strang's name, by the way, is being used to boom numerous meets just at present. Atlanta, Ga., had him booked to appear at a track event there on the eve of the Long Island Sweepstakes date.

Park Roads Uninjured by Race.

After the Philadelphia automobile race in Fairmount Park, on the 10th inst., Chief Engineer Vodges was surprised to find that the park roads had suffered very little damage from the high speed, even at the turns. A few men and a steam roller were able to put the surface in good shape again in short order. The bond of $2,500 filed by the Quaker City Motor Club to cover the cost of the repairs was more than ample.

RIVAL CLUBS IN TEAM CONTEST

Chicago Athletic Association Defeats Chicago Automobile Club in Reliability Run—Only Amateurs Compete.

In what was heralded as the first competition of its kind ever held in this country—an inter-club contest—the Chicago Athletic Association met and defeated the Chicago Automobile Club by a score of 79 to 732 on Thursday last, 15th inst. Added distinction was gained by the contest from the fact that it was purely an amateur affair and was carried through without regard to trade interests of any sort. Long standing rivalry gave rise to the challenge to a team match which was issued by the Athletic Association. Upon its acceptance it was agreed that the representation should be made up of ten cars on each side. In the eleventh hour, however, four of the challenging team's entrants withdrew, leaving but six champions in the field. It was decided on this account to arrange the penalties on a pro rata basis. This served to enliven the task of the technical committee and also to obscure to a certain extent the full effect of the happenings on the 100-miles Elgin-Aurora circuit, pending their digestion by that august body.

When the final report appeared it was learned that three of the six starters in the "Cherry Circle" team of the athletic club had been penalized in small amounts, while six of the automobile club's representation had been mulcted in larger amounts. The statistical outcome of the calculations was as follows:

Chicago Athletic Association	Penalizations.
S. W. Ham, Locomobile	Perfect
C. T. Knisely, Premier	Perfect
C. C. Ireland, Stevens-Duryea	Perfect
F. W. Wentworth, Rambler	1 point
W. K. Cochrane, Stod-Dayton	25 points
W. K. Young, Thomas	53 points
Total points lost	79

Chicago Automobile Club.	
Bert Nash, White	Perfect
F. W. Gethro, Stevens-Duryer	Perfect
R. Tarrant, Jr., Stod-Dayton	Perfect
N. H. Van Sicklen, Apperson	Perfect
Carroll Schaffer, Stevens-Duryea	Perfect
T. P. Henderson, Studebaker	115.2 points
W. A. Egemann, Rambler	600 points
J. H. O'Hare, Thomas	1.8 points
C. E. Gregory, Thomas Forty	15 points
R. H. Colby, White	Perfect
Total points lost	732

The management of the contest was rather lax, inasmuch as the rules set down were none too closely followed, while their enforcement was not carried out in strict accordance with the prearranged plan. Thus, several of the drivers departed from the regular confetti-laid roads, and others replenished fuel and water supplies without regard to the restrictions imposed upon them. Such infractions, however, were excused in some instances, owing to the recognition of a "misapprehension" on the parts of drivers or observers as to the proper course to pursue. The inevitable outcome was dissatisfaction, loudly expressed by those whose lack of understanding of the rules was not accepted at full value by the referee.

Scarcely had the caravan started on its way, when misfortune clipped the wings of W. A. Egemann's Rambler, running under the Automobile Club's colors. While skimming along Michigan avenue, the car skidded on the wet asphalt into a curb and smashed a rear axle and wheel. The driver cheerfully telephoned for another car, a Rambler roadster, and when he received it, set out in pursuit of the rest of the pack. This caused a loss of 600 points to the score of the Chicago Automobile Club. It was a severe shock to the other members of the team, and, coupled with the smash-up of T. P. Henderson's Studebaker, almost caused despair. The second accident occurred on the out-going trip on Milwaukee avenue, when the driver attempted to swing around a loaded truck, skidded on the car tracks and broke a wheel. Like Egemann, he refused to withdraw, and telephoned for a new wheel, replaced the broken one, and started out to catch the others. This cost the automobile organization no less than 115.2 points. The other penalizations imposed upon this club were not so severe. J. H. O'Hare, driving his Thomas Flyer, lost 3 points for needlesly stopping for water between controls, "under a misapprehension," and C. E. Gregory's Thomas "40" was assessed similarly 15 points.

The opposing team suffered less keenly. Witt Cochran, driving a Stoddard-Dayton, dropped 25 points for stopping his motor while checking in; W. K. Young, handling a Thomas "Six," lost 53 points for syphoning gasoline from one tank to another, and F. W. Wentworth's Rambler had its perfect score chipped by one tiny point for adjusting a spark coil. Cochrane protested his penalization, claiming that he had already checked in to the best of his knowledge before he shut down his motor.

There was very little tire trouble on the run, although the bad stretches in certain parts were enough to worry any tubes. A large staff of speed sleuths were lying in wait for "picking" in the vicinity of Melrose Park, but the course was so arranged as to avoid these paths and fool those who had looked for a profitable day.

The route followed was through Itasca, Roselle, Dunning, Wooddale and Bensonville to Elgin. After checking in the teams set out for Aurora, where dinner was taken during a control of one hour.

In consequence of the success of this first venture the members of the association are now anxious for a longer and more strenuous run. It is planned to make the contest an annual affair, which another time, may take the form of a sealed bonnet run.

TREE CLIMBING STUNT AT LENOX

Not on the Card, but Knight's Car Does It—Bourque the Kingpin at Church Hill Climbfest.

In the course of a hill climbing contest held at Lenox, Mass., on Wednesday, 14th, inst., Floyd Knight, in a six cylinder Stillson car, not only mounted the hill at a goodly rate of speed but also climbed a stately white birch tree, stripping it of much of its daintily tinted autumn foliage. Knight did this not from choice, nor to damage property, but in order to avoid a collision with William Tolhursts's car. Happily no one was hurt. Shortly after this occurred, William Bourque, in taking the hill with a Knox, tried to take a few more things with him. He ripped up a four-inch iron guide post with its concrete foundation, roots and all, and kept right on without stopping. Upon a second trial with the same car, having eliminated all obstructions, he shot up the hill and won the event, a free-for-all.

The climb was held by the Lenox Protective Automobile Association and the nine-tenths mile course up Church hill and Aspinwall Park, with the finish line at the Aspinwall Hotel, had a grade that varied from 9.15 to 12.5 per cent., with three sharp turns. The event was well attended by local enthusiasts who numbered about 4,000. Three motorcycle events preceeded the automobile program.

Irving D. Sisson won the event for cars of 20 horsepower and under in 1:59, with Fred M. Smith and Edward C. Knight in Fords, second and third. Bourque took the 20-40 class with his Knox in 1:34; O. R. Hutchinson and Lester Phillips in second and third places.

In the class for big stock cars of from 40 to 60 horsepower, William Swan shot up the course in 1:38⅗, beating the time of Knight's Stillson by 9 seconds. Swan ran second to Bourque in the free-for-all.

The summaries:

Cars of 20 horsepower and under—Won by Irving D. Sisson, 18 horsepower Buick; second, Fred M. Smith, 15 horsepower Ford; third, Edward C. Knight, 15 horsepower Ford. Time, 1:59.

Cars from 20 to 40 horsepower—Won by William Bourque, 38 horsepower Knox; second, O. R. Hutchinson, 26 horsepower Pope-Hartford; third, Lester Phillips, 30 horsepower Pope-Hartford; fourth, F. A. Knight, Buick; fifth, James E. Crabe, Berkshire. Time, 1:34.

Cars from 40 to 60 horsepower.—Won by William Swan, Stearns; second, F. A. Knight, Stillson. Time, 1:38⅗.

Free-for-all.—Won by William Bourque, 38 horsepower Knox; second, William Swan, 30-60 horsepower Stearns; third, Stuart H. Clapp, Berkshire. Time, 1:19.

CUDAHY'S MISPLACED CONFIDENCE

Millionaire Packer's Big Car Beaten in Match at Kansas City—Burman Captures Sensational Free-For-All.

Out in Kansas City, where the name of Cudahy is a mighty power, 10,000 persons or more, turned out on Saturday last, 17th inst., to watch the automobile races on Elm Ridge track, held under the auspices of the Kansas City Automobile Club, and more particularly to witness the J. P. Cudahy challenge race. The millionaire beef packer offered to pit his 50 horse-power Welch against any privately owned car in Kansas City, at any distance, "for money, marbles or chalk." Two owners picked up the gauntlet—James B. Porter, with a Chalmers-Detroit "Bluebird," and Frank J. Dean, who banked on his Packard. If some Missouri "showing" was wanted by Cudahy, this pair was ready to give demonstrations, as they affirmed.

Cudahy was enlightened shortly after the three cars started on the ten miles whirl. The Packard, with John Clancy at the wheel, took the lead in the first mile, with G. W. Morgan in Cudahy's Welch following, and the "Bluebird," driven by Karl Schnarr, last. In the second mile, the Bird chirped as it flew past Morgan in front of the packed grandstand, and took second place, holding it until the fourth mile. Then, when Schnarr opened up the throttle and the Bird began to sing louder and flap its wings with more vigor, it darted into first position, leaving Morgan at the tail end of the line. Soon the latter pressed his Welch past Clancy into second place, however, and the cars finished the race in that order, Schnarr winning by a fair margin in 11:22 4-5. At no time during the sprint were the cars more than 100 yards apart.

Mile after mile was reeled off at a 60-mile-an-hour rate in the 50 miles, free-for-all, an event that was captured by Robert Burman in a 40 h. p. Buick, in 59:59. The cars spun around in a heavy cloud of dust and all but one of the ten contestants, a Buick, driven by Glen Breed, had trouble of some sort. One of the cars tore off a good-sized piece of fence while skidding a trifle on a turn, but kept on its way. Dr. C. H. Carson was second, with a 40 h. p. Locomobile, with R. H. Collins's Buick third.

A novelty was introduced in the form of a half-mile obstacle race, open to electrics driven by women. Six contestants faced the starter, and the race soon became a real comedy affair. Two of the drivers did not heed the instructions to stop at the half-mile post and await further advice about taking the obstacles, but kept right on, with the result that they tried to pass through the narrow maze of barrels simultaneously, much to the delight of the shouting crowd. The cars were then re-started and the ladies at once encountered further difficulties before they finished the course. Mrs. Joseph H. Wittman, in a Pope-Waverly, won the first prize, which was "the dearest, sweetest hat," valued at $150. She negotiated the tantalizing labyrinth without touching any of the barrels in 3:08 1-2, disproving the assertion that women cannot aim straight. The best time of the event was made by Mrs. F. E. Gloyd, with a Woods, in 3:08, but she tipped over a barrel, which spoiled her chances for the fascinating trophy.

Gus Seyfried, in a White Steamer surprised the people by winning the 10 miles race for the Board of Trade cup, in 10:47, the popular opinion having been that one of the higher-powered cars would bag the trophy, as in the preliminary heat the White only got second place. Seyfried, however, managed to show the field his dust in the final—the nearest to approach him being A. O. Brooks's Stoddard-Dayton, which scored second, while Burman took third with his Buick. There were nine competitors in this event, and the heats were warmly contested.

Guy Morgan drove a lone race with Cudahy's Welch, in a five miles stock car event, the only other contender being George McEntire, who dropped out with his Chalmers-Detroit, in the first mile.

Charles Levendoski, guiding a Maxwell, won a five miles event for stock cars costing $2,000 and under, in 7:24, over R. C. Greenlease (Cadillac), who was second. Robert Burman, in an 18 h. p. Knox, distanced George McEntire (Chalmers), for third place.

Two heats of a five miles free-for-all were run, each of which gave first place to White cars, driven by Ralph Baker and Gus Seyfried. A Buick, driven by Burman, and a Pilain, handled by V. C. Snyder, also qualified, but darkness fell so quickly that the final heat could not be run.

Governors to Discuss Uniform Laws.

Lobsters, automobiles and trees are to engage the governors of all the New England states in a conference which is to be held in Boston right after the election. A whole day has been set aside for discussing the possibilities of uniform automoble laws for Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, together with a consideration of plans for improved highways and the establishment of interstate trunk lines or thoroughfares running along logically and carefully prepared routes from one large New England center to another. All the meetings will be open to the public, while the participants will consist of the governors themselves together with their lieutenants, the attorneys general, the presidents of the New England senates and the speakers of the house of representatives, the congressmen and United States senators of the states, and various invited citizens.

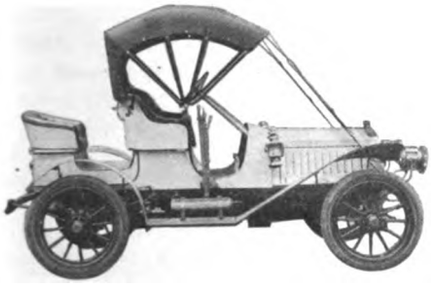
TWENTY ENTRIES FOR SAVANNAH

America, Italy, France and Germany to Compete in Grand Prize—Try-out to be Held on the Motor Parkway.

Following almost uncomfortably close upon the heels of the Vanderbilt Cup contest for its own advantage, the inauguration by the Automobile Club of America of the Grand Prize race which it is planned to develop into the great international event of the future gives promise of as good an assemblage of racing material as ever has been seen in this country. Although entries do not close until Nov. 1, the extended date, 20 cars have already been enrolled, of which five constitute the American representation. Three other countries also are represented, in the teams of Italy, France and Germany, each of which at present numbers five cars.

Grand preparations are being made by the A. C. A. and its local ally, the Savannah Automobile Club for the Thanksgiving Day event and its curtain raiser—the International Light Car race—which is scheduled for November 25th, the day previous. Aside from the elaborate arrangements which are being made for the entertainment of the expected hosts of visitors, the highways comprising the 25 miles Chatham County circuit are being graded and banked, and in one instance an entirely new road is being constructed for the "circuit within a circuit" for the small car race, which is to occur on November 25—the day preceeding the Grand Prize itself.

A number of the foreign drivers who are to participate in the race are either on their way to this country, or will start within a few days. Prior to their adjournment to Georgia, it is planned to give them an opportunity to test their machines on the Long Island Motor Parkway. Saturday, October 31, has been set as a tentative date for this try-out, which doubtless will serve as a good advertisement of the race itself. The list of entries for the Grand Prize, as at present constituted, is as follows:



Locomotive	L. T. Bergdoll
Matheson	Louis Chevrolet
Acme	Cyrus Patchke
Lozier	Harry Michenor
B. L. M.	Thomas Williams
Fiat	Louis Wagner
Fiat	Felice Nazzarro
Fiat	Ralph De Palma
Itala	Henri Fournier
Itala	Alexandre Cagno
Benz	Victor Hemery
Benz	Reve Hanriot
Benz	Fritz Erle
Mercedes	Poegge
Mercedes	Salzer
Bayard Clement	Hautvast
Bayard Clement	Rigal
De Dietrich	Duray
Renault	Francois Szisz
Renault	Lewis Strang

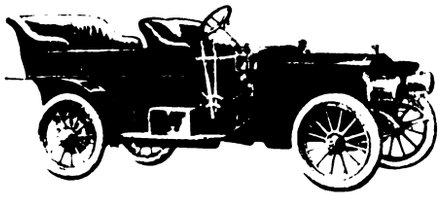
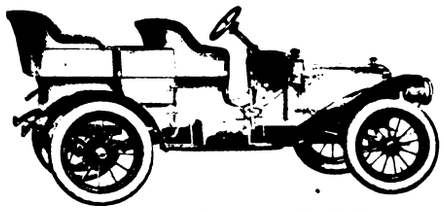
THE MITCHELL MODELS FOR 1909

Additional Particulars of the Offerings for the Coming Season—Some of the Noteworthy Improvements.



Early announcement was made of the features which are to characterize the 1909 product of the Mitchell Motor Car Co., but at that time no illustrations of the finished cars nor even their complete specifications were available. Present activities at the Racine, Wis., factory of the company, however, where the cars are rapidly passing through the various stages of production, have made possible the publication of these fuller particulars. As already told in these

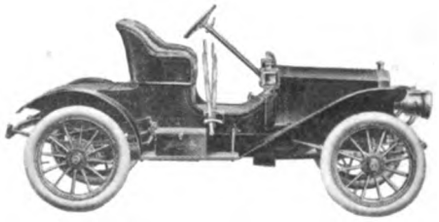
MITCHELL ROADSTER



columns, the line for the coming season is to consist essentially of four vehicles, that is to say, two touring cars, seating five and seven passengers, respectively, and two lighter models, one a runabout, and the other a roadster. Of these the seven passenger touring car and the runabout are already familiar, though they have undergone some slight modification since first introduced. The "star" member of the group is the Model "K" touring car, which is considered an unusually attractive offering of "the-most-for-the-money" order.

As already described, the motor of this machine, which is rated at 28-30 horsepower, is of 4¼ by 4½ inches, cylinder dimensions, with a combination arrangement of the valves, consisting of overhead inlet and side exhaust, the latter comprising di-

MODEL "L" TOURING CAR

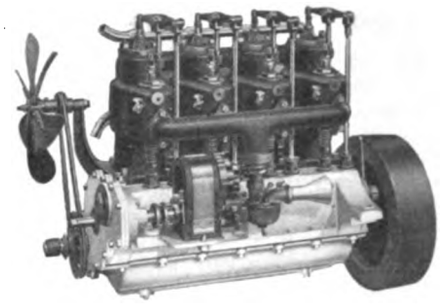


rect acting gearing, while the former employs the walking beam and long tappet rod arrangement, which is so much in use at the present time. Both sets of valves are actuated from the same side of the motor, and by a single cam shaft. The two-to-one gears are fully enclosed in a housing formed integrally with the crank case, but closed with a cover which is readily removable. The magneto, which is a regular feature of the equipment, together with the carburetter, is carried on the cam shaft side of the motor, making the principle moving parts and accessories easily accessible without necessitating the lifting of more than one side of the bonnet when making ordinary running adjustments. The crank case supports are cast integrally with the upper sec-

MODEL "K" TOURING CAR

tion of the case, leaving the lower section free for removal without disturbing the motor in the car. The radiator fan is carried well to the front of the forward cylinder, and is mounted on a bracket rising directly from the crank case, and is thus made entirely independent of any possible wearing among the cylinders.

As will be seen from the accompanying illustration, the change speed gearing employed, which is of the selective pattern, is mounted entirely on roller bearings of the Hyatt type. There are two sliding sets, that affording the high gear, developing the direct drive by means of a massive jaw clutch. The lay shaft is arranged to run at all times, though entirely disengaged while the high gear is in use, and the reverse is obtained by means of an idler which

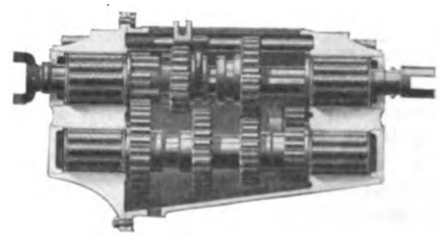


MODEL "J" RUNABOUT

also is in constant motion, though disengaged except when used for driving the car. The provision of a double set of universal joints—one between the master clutch and the gearset and the other at the forward end of the propeller shaft, ensures long life for the entire group, since the shafts and their mountings are relieved of any possible disaligning strains due to the racking of the frame out of its proper relationship.

The propeller shaft is equipped with double universal joints, and the live rear axle is held from rotation by means of the conventional single torque rod, suitably suspended at its forward end in the waist of the chassis. Like the entire mechanism of this and the other models, the rear axle is of original design and construction throughout.

The overall chassis specifications are: Wheelbase, 10¾ inches; wheels 32 inches diameter, shod with 4-inch tires. An unusual option is offered in the matter of body mounting in that the chassis may be had with either the detachable tonneau, surrey, runabout deck or single rumble arrangements, though, of course, extra charges are made where the purchaser desires more than one style of body.



These particulars apply to the model "L" touring car: Engine dimensions, 4¼ by 5 inches, rating 35-40 horse-power; change gear selective; ignition, magneto; wheel base, 117 inches; wheels, 34 inches, shod with 4-inch tires. What are designated as extras are the use of the rear springs of the platform type, steel running boards, a full floating axle, ebonite-finished steering wheel, instead of merely a stained wood finish; improved upholstering. These characteristics, together with a distinguishing

MITCHELL MOTOR

mark in the improved design of the radiator, which also applies to the model previously mentioned, go to make up the more significant changes in this model as compared with the corresponding one of the current season.

Unlike the other two models described, Model "J," the runabout, is not equipped with magneto, though it is specified by the makers that the motor has been so designed that a magneto can be added to the regular jump spark equipment, or substituted for it, if required by the purchaser. The cylinder dimension of this motor are 4 by 4, and its output is listed at 20 horsepower. The selective method of gear-change is here employed, as is the shaft drive, as well as the other typical features of the line. Al-

CHANGE SPEED GEARING

though practically a continuation of the present runabout model, sundry minor improvements have been made in its construction, as in the arrangement of the spring suspension, for example, all of which go to improve its riding and wearing qualities. The wheel base is 92 inches, and the wheels are 32 inches in diameter, shod with 3½-inch tires.

LOCOMOBILE MODELS FOR 1909

Entirely New Car to be Included in Forthcoming Product—Marked by Radical Departure in Two Features.

Among the announcements of new products which have appeared during the week, perhaps none is calculated to create greater remark than that of the Locomobile Co., Bridgeport, Conn., in which is forecasted in addition to the 40 horsepower model which is the most powerful machine made in stock form under that name, an entirely new car of 30 horsepower rating and bearing what is, in this instance, a radical departure from former practice in the use of the shaft drive and floating rear axle construction. The new Model "30," as it is to be known, is in other respects, practically uniform with both of the types in present use, and forms an intermediate type between the "40" and the little "20," which is so well known.

The largest car of the trio has the standard type of four-cylinder motor, the dimensions of which are 5 by 6 inches, and which is said to develop no less than 60 horsepower "on the bench." It has 123-inch wheel base and 36-inch wheel shod with 4 and 5-inch tires, front and rear. Landaulet and limousine body equipments also are provided for this chassis, in addition to the regular touring equipment, while it is further produced in the form of a runabout model, which was brought out during the latter part of the present season. Practically the same arrangement also is obtainable in the form of a "toy" tonneau.

The new model has a "square" motor, of 4½-inch cylinder dimensions and develops no less than 38 horsepower under test conditions. The machine as a whole displays such of the Locomobile characteristics as low tension, make and break ignition, bronze engine base and gearbox, four-speed, selective change gear, ball bearing mountings wherever required, and is made with special alloy steels, and heat-treated drop forgings produced at the Bridgeport shops. Its wheel base is 120 inches, its overall length 15 feet, and its wheels 34 inches diameter, shod with 4 and 4½-inch tires, front and rear. Despite its length, it is designed with sufficient steering lock to permit a complete turn within a 38-foot circle, which makes it possible to swing the vehicle in any ordinary street. Runabout variations are presented also in the two and four seated—"toy" tonneau—types, the inclined steering column, low driving position and other runabout characteristics being secured in a peculiarly effective manner.

Particular interest centers about the rear axle construction, which is the distinctly novel feature of the machine, though in no way a radical departure from the precedents of accepted practice. The parallelism of the front and rear axles is preserved by means of distance rods, corresponding in form to those employed on the chain driven models. These rods carry the brakes, and their rear ends are swiveled to the axle tubes. This arrangement serves the three-fold purpose of removing the bending stresses from the struts when the springs are depressed, removing the braking stresses from the rear axle, and relieving the springs from disastrous torque and driving strains. The latter purpose also is served by swiveling the spring seats about the axle tubes. The tubes themselves, also are relieved from all torsional stresses.

The axle proper is trussed by means of tension rods which extend from the differential housing to the ends of the tubes, while particular structural advantage is claimed from the fact that no brazing is used in the process of assemblage—the tubes and housing being secured by means of pressed fits and rivets. The torque stresses of the group are resisted by the usual single bar, which is affixed to the differential housing at its rear end, while in front it is suspended from a cross member of the frame by means of cushioning springs. The layout is such that practically a straight line drive is obtained when the chassis is carrying its normal load. The propeller shaft is equipped with a universal joint at either end as well as a slip joint at the rear. The driving portions of the rear axle are of the full floating type with what is usually known as the "hub cap" drive.

Caution in Refilling Fuel Tanks.

When refilling fuel tanks from which the carburetter feed is taken by means of the compression system, great care should be taken to provide against the danger of igniting the fumes which are liberated as the pressure is let off. In every case the exhaust gas or air which has been imprisoned in the tank will be charged with a certain amount of fuel vapor, and in some cases it may contain sufficient air to form an explosive mixture. In any case it is liable to become so soon after being liberated. On this account, open flame lights, matches, even the supposedly innocent tail light, must be scrupulously extinguished as a necessary precaution.

Tensioning Springs of Automatic Valves.

No such delicate adjustment is required in the tensioning of the retaining springs employed with the valves of the mechanical type as is necessary where the action is entirely automatic. At the same time either excessively high or low spring tension tends to a certain extent to interfere with the proper action of the part. Thus too strong a spring is apt to shove the valve into its seat with such force as to destroy its accuracy, if not actually cracking the valve head by the severe impact. Insufficient tension, on the contrary, makes the valve sluggish in closing, and is apt to have an effect upon the action of the motor accordingly.

INNOVATIONS IN NAPIER PRODUCT

Edge's Announcements Include a Two and a Four Cylinder Model—Characteristics of the Twin Motor.

One of the most significant and at the same time interesting innovations of the season in British motoring circles is embodied in the new product of Messrs. S. F. Edge, Ltd., who have announced for the coming year three new members of the Napier line. One of these—a 30 horsepower, six-cylinder car, is a continuation of the former policy of the company in the production of sextuple-engined cars. The other two are to be machines of 15 and 10 horsepower, respectively, and equipped with four and two-cylinder motors. In addition to these machines, the six-cylinder cars already introduced will be continued in the several sizes and with but slight modification.

The two, three and six-cylinder models, which are new, possess a common feature in their engine dimensions, which are 3¼ by 5 inches, bore and stroke. The specifications of the twin motor, just announced, show it to possess several features new to this make of car, such as completely enclosed valve gear, unit mounting for the power plant, and also magneto ignition, without the jump spark duplication. The cylinders are cast in pairs, the units being common to the three models, the design of the motors being uniform in other respects except for the number of cylinders employed. The full importance of the announcement is not appreciated until it is remembered that it is only a couple of years since Edge renounced all but four-cylinder models with great blare of trumpets, since which time he has devoted himself exclusively to the production of high-priced cars of that stamp. The new small cars are intended for cab as well as light car service, while the unit power plant also is designed to be utilized in the equipment of motor boats.

Improper Placing of Non-Skid Bands.

It has frequently been pointed out that it is improper to use non-skid bands on opposite front and rear wheels, only, or on only one of the rear wheels for the reason that this provision involves an undue amount of differential action, thereby tending to overwork that device. A further and perhaps more important argument against this practice is on the ground that the non-slipping of one of the wheels, which is thus assured, by no means prevents rthe other from sliding. The result is that on slippery roads the wheel carrying the non-skid does practically all of the work of propulsion, while the other merely slips in practical idleness and at a relatively high rate of speed.

REFINEMENTS IN LIVE REAR AXLE

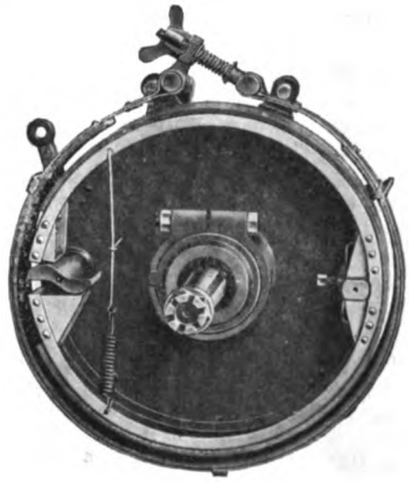
Radical Treatment of Interior Parts in Timken Construction—Provisions for Accessibility and Adjustment.

Increased use of the live axle method of transmission has given rise to a number of significant improvements in that critical device. Further details concerning the new "one piece" pressed steel tubular axle, which the Timken Roller Bearing Axle Co., of Canton, O., is producing for cars weighing under 3,000 pounds and not exceeding 45 horsepower, and which has already been reviewed in these columns, disclose a number of features in design and construction which are calculated to improve its endurance and increase its serviceability. The boldness of method employed in the design of the axle and differential housing itself, where the entire load bearing and gear encasing member is a single unit, is matched by the way in which the disposition of the

GEAR CARRYING UNIT VIEWED FROM LEFT

interior parts is effected, and provision made for retaining the integrity of their relations.

As will be seen by the accompanying illustration, the differential housing is of spherical form, having but one bolted-on plate, the latter being on the forward side where the rear end of the propeller shaft is admitted. The sides taper into tubular extensions out to the hubs of the wheels, forming the outer axle, the thickness of the metal increasing from the center to the axle ends. The blending of globular and tubular forms results in doing away with the angles and joints which are common to many types of built-up axles and which are thought to increase the strains and shocks at various points by leverage, as well as providing points of structural weakness. Spring seat bases are swiveled in generous loose mountings on the axle, to lessen shocks from the latter being communicated to the body. The strut rod braces, when required, are placed on separate brackets, immediately underneath the frame, to give a straight thrust from axle to the car sides. The bosses are extra large and are fitted with bushings having hardened steel bearing surfaces.



In addition to the improvement in the form and strength of the axle proper, the parts comprising the shaft pinion and differential mounting have had radical treatment. The differential gear is contained in a carrier, which, as shown in the accompanying illustrations, is one unit, comprising the plate which closes the housing, the bearing

FRONT VIEW OF REAR AXLE, SHOWING GEAR CARRIER, SPRING BASES AND BRAKES

for the pinion end of the power shaft and the two bearings for the gear itself. The outer face of the differential carrier has a vertical bearing set in its cheek for the cross-end of the Y shaped torque bar, the latter being permitted a hinged relation with the rear axle. A feature which reveals to what degree of refinement the construction has been carried consists of the provision of worm screws by which the bearings of the differential gear may be adjusted from the outside without the removal of anything more than the cotter pins in the screw heads. The whole gear carrier with the gear itself may be removed from the housing without taking down the axle or disturbing brake equipment, springs, hubs or bearings. The live axle is furnished in both clutch and fixed type hubs.

Both internal and external brakes are supplied in a form which makes efficiency

SIDE VIEW OF BRAKE

certain. They are approximately 14 inches in diameter and 2½ inches in width. The levers for the internal brakes are placed within the limits marked by the sides of the chassis to prevent complication or interference with the leads to the external brake levers. The band of the internal brake is of pressed steel and fills the entire inside diameter of the drum, a double acting cam at the anchorage point spreading it with even force all around against the friction surface of the drum. A strong spring release tension makes it float clear of the friction surface when not in use. The brake box and friction surfaces are kept dry and free from lubrication by double felt washers between the shaft and the axle casing.

The wrap of the contracting band on the external brake is designed to be equally absolute whether the direction be forward or back. The result is obtained by means of double anchor and fulcrum points, which change with the direction in which the wheel rotates instead of being positively

GEAR CARRYING UNIT VIEWED FROM RIGHT

fixed. The brake band floats with the drum for a short distance around to the anchor points, which serve as fulcrums for pulling tight when pressure is applied.

Adjustment of the Air Brake Linkage.

While the average driver is enough of a mechanic to so adjust his brakes that the lever or pedal will not reach the limit of its travel before the bands are fully applied, it does not always occur to him to observe whether all of the brake linkage is clear of the frame and other mechanism at that time. Even a very slight amount of interference in an out of the way spot may cause the brakes to slip.

To Avoid Leaks in Cooling System.

To avoid leaks in the cooling system it is absolutely necessary that the water overflow and steam outlets be kept clear at all times. The constant presence of dust and more or less oil tends to clog them, and when this occurs the increased pressure in the system which always follows the warming up of the engine, causes the contents to seek outlet at the weakest point.

FUEL CONSUMPTION AS AN INDEX

Excess Rate Denotes the Existence of Trouble—Some of the Most Fruitful Causes of Waste.

It is important that the owner should keep close watch over the fuel consumption of his car, checking it up by the mileage totals of the speedometer, because it not only enables him to observe the rate of expenditure for operating the machine but also furnishes a valuable indication of running conditions in the machine. It is a simple matter to arrange a systematic log wherein the rate of consumption per car mile is readily calculated. This being done, any abrupt increase in fuel cost, must be taken as an indication of something gone wrong, unless of course, it is caused by unfavorable running conditions—in which case the increase will be only temporary.

Four possible causes may contribute to a high rate of fuel expenditure. Thus unfavorable highway conditions in the matter of mud, an unusual amount of hill climbing or the haulage of a heavier load than is customary must be sought for as soon as an unforeseen rise develops Failing either of these, the increase possibly may be chargeable to a faulty adjustment of the carburetter, whereby an over-rich mixture is being used constantly. If this happens to be the case the foulness of the exhaust as well as the sluggish action of the motor furnishes supplementary clues.

The other sources of possible excess may not be so apparent. A fruitful cause of waste, of course, is leakage in the feed piping to the carburetter, as well as a poor float adjustment which may cause the mixing chamber to overflow, even when the motor is in action. In some instances though this may not be sufficient to cause an appreciable amount of drip, sufficient gasolene will be carried away and evaporated in the bottom of the mixing chamber and in the pan directly under it, to cause a very noticeable loss of fuel. Indeed, one authority states that in the case of a machine standing over night on the floor as much as a quart of fuel may be evaporated without any noticeable drip occuring. This difficulty must be eliminated at once when discovered, as it contributes very largely to the fire risk, in addition to increasing the gross consumption.

In the event of any stiffness in the transmission of the vehicle, or even in the motor itself, the resulting increase in load will, to a certain extent, manifest itself in a rise in the rate of fuel consumption per car mile. Thus a dragging brake band, a stiff crank shaft bearing, even a disaligned steering gear which causes the front wheels to run out of line, may be the cause of an indication sufficiently noticeable to flag the difficulty. The rate of consumption thus may be used as an accurate indication of running efficiency when considered on a mileage basis, even though it cannot be construed into an absolute guide to the actual source of trouble where such exists.

Spark Plugs that are Soot Proof.

In the excitement of a big race, when victory hovers uncertainly over the contestants, the driver and mechanic who have no worries about ignition trouble or missing cylinders have much to be thankful for, as the service required in racing conditions is particularly severe. The high speed of the engine necessitates a great use of lubricating oil, no small part of which deposits as carbon in the cylinders. As showing how heavily this deposit occurs, the ac-

companying illustration of the Soot Proof plugs taken from the winning car in the Jericho sweepstakes right after the race, is ample evidence. The constant and heavy lubrication of the motor during the race resulted in the charring of the surplus oil and the formation of a thick coating of black soot in the explosion chamber. While lubricating oil as poured into the tank has insulating qualities rather than conductivity, yet when it has burned to a carbon residue the latter is only too ready to short circuit the ignition current. In fact many cases of ignition trouble are directly attributable to the spark plugs failing to give the spark at their points because the high tension current has been "shorted" from the central pole to the return of the outer shell by means of a soot coating on the insulation. The appearance of the plugs in the picture, however, makes it plain that their construction has obviated this possibility, as they gave uninterrupted sparking throughout the race, in spite of their heavy carbon deposit.

Against Overstraining the Nuts.

When bolting separate parts together it is advisable to bring as little strain upon the nut as possible. If the bolt sticks in the hole it should be driven down by hammering the head, and if the parts do not come together easily it is better to clamp them temporarily than to overwork the nut. The danger lies in the tendancy to stripping the thread.

EARMARKS OF REFURBISHED CARS

One Sure Way to Recognize the Renovated Vehicle—Parts that the Painter is Apt to Neglect.

Ordinarily a sure way of distinguishing a used car which has been refurbished up to look as good as new, from one which has never been used at all, is to examine the paint on the runing gear and the underneath parts of the chassis. It is observable that however successful the average automobile painter may be in his treatment of the body portion of the "job," when it comes to the chassis he is apt to fall below his best standard. The reason for this is not far to seek. "The carriage painter"—from whose ranks most automobile painters are drawn—"is practically at home with any work to be applied to the body of the automobile, because, primarily, he has been specially trained along this line," says a well-known exponent of the craft. "But coming to the chassis, and particularly to the under parts of the gearing etc., the work takes on a different aspect.

"These parts, with most machines, are very much neglected during service, so that when the car visits the paint shop it is more often than not in a sorry condition. The precisely well painted or well touched-up and varnished job is that which has thorough work applied to it throughout—that is uniformly well taken care of over all its parts, in fact.

"These under parts, then, should be thoroughly cleaned, using some form of petroleum substances to loosen up the grease and caked accumulations, finishing off with a wash of turpentine, the parts then being wiped dry. Then coat up with a black flat color, with a binder of raw linseed oil in it, finishing in proper time with a coat of black japan, or black color and varnish."

Caution in Rebabbiting Bearings.

A recent accident in a Michigan garage points to the need of special caution when rebabbiting bearings under the extemporized conditions which prevail in the average establishment of that sort. A mechanic was pouring the metal into the bearings of a motor car when in some way the fluid came in contact with a small quantity of water. In the resulting explosion painful if not serious injuries were caused.

Importance of Keeping Hub Caps Clean.

That old admonition about the importance of keeping the hub caps, as well as the wheel and knuckle bearings, clean and free from verdigris such as may accumulate in the brass attachments loses none of its importance with frequent repetition. Because the bearings involved usually require little or no attention there is a great tendency to neglect them altogether.

WORLD'S HIGHWAY EXPERTS MEET

International Roads Congress at Paris Deals with the Automobile Problem—What the Ideal Road Must be.

No neglect of the motor can be charged against the International Roads Congress which began its sessions in Paris on the 12th inst., and which is attended by delegates not only from the United States but from practically all the European countries and from the Orient, as well. As a matter of fact the motor car may be credited with having brought about the congress, the main reason for its convocation being given as a desire to solve the problem that automobile traffic presents. Fortunately there is no hostile spirit to the automobile manifested in the gathering, the delegates apparently seeking to learn the best ways of combating the evils which it is accused of creating by its operation on public highways.

The congress was opened by M. Barthou, the minister of public works, who in a felicitous speech welcomed the delegates of the many nations represented. Graceful responses were given by the presidents of the delegations from the United States, Great Britain, Belgium, Germany and Russia, the American sentiments being voiced by L. W. Page, from Washington, director of the United States Office of Public Roads. In the afternoon the serious business of the congress commenced at the Tuileries.

Because of their more or less limited knowledge of French, the English speaking delegates soon organized themselves into an Anglo-American conference, holding meetings in advance of and separate from the general conferences. They were careful to make it clear, however, that this action did not mean any divergence from the regular sessions of the congress but was solely for the purpose of getting a better understanding of the progress of the congress, the proceedings of which were translated into English and discussed at the Anglo-American meetings. Conversely the speeches and recommendations of the English speaking delegates at their conferences were translated into French for the benefit of the whole congress, and the tabulated information and the specifications which they employed were converted into metric as well as British units.

The new conditions created by the automobile are recognized as the governing influence to be considered in future road building, although there is a wide diversity of opinion as to how they are best to be met. Not only pleasure cars of high speed but commercial vehicles for heavy transport enter into the considerations for the future.

The ideas of the members of the congress as to what shall constitute the ideal road of the future approximately agree—namely, a road with a well drained solid foundation, built of some hard aggregate bound together by tough, elastic binder, waterproof and free from dust or mud, hard enough for automobiles, yet soft enough to be adapted to horses' feet.

Whatever the material from which the road is built there is a general agreement upon the following points: Main highways must in the future, wherever possible, be airlines between important centres, with branch roads connecting up to the main lines for local traffic.

There should be no curves on the main roads of smaller radii than 300 feet in the open country and less than 150 feet in the hills. Reverse curves should be avoided, also steep grades with curves, and level railway crossings, and the outer edge of curves should be raised. Opinions as to width vary greatly, but the average is a minimum of about thirty feet.

In a paper on the subject, Col. Bromwell, superintendent of Public Buildings and Grounds at Washington, points out that if park roads cannot be modified to meet the new conditions they will rapidly deteriorate and become useless. Col. Bromwell's idea is that park roads should be so constructed as to meet the somewhat contradictory requirements of being smooth and elastic in surface for horses, and hard in surface, and not too slippery, in order to be suitable for the motor traffic. The road of the future, he thought, should be composed of some tough elastic material, bound together by another material possessing similar qualities. Such roads would cost more originally, but the maintenance would be less.

To obtain an ideal road Col. Bromwell suggested the interposing between the base course of the macadam and the top course of a layer of asphaltic or tar compound, carried for convenience in a sand base. If the top course was then rolled and compacted the compound would be forced up into the interstices of the upper course, thus thoroughly binding the stones together and forming a top course of asphaltic or tar concrete. Just enough top dressing should be applied to fill up the larger interstices of the top course, and this top dressing should contain little or no dust or very fine ma the surface of roads already built with material.

L. W. Page, director of the United States Office of Public Roads, submitted a paper in which he contended that the main factor of injury is the great tractive force, or sheer, exerted by the driving wheels of motor cars. He admitted that he can offer no satisfactory solution of the problem of road deterioration by automobiles. However, he thinks the question could be met by following one of two general methods; first, by constructing roads in such a manner and of such materials as to reduce to a minimum the formation of dust, and, second, to treat the surface of roads already built with materials that will give the same result.

MUST KEEP THEIR ROADS IN ORDER

Lancaster Automobile Club Warns Pennsylvania's Negligent Officials—Further Neglect to Cause Prosecutions.

Upon opening their mail, the supervisors and constables of the small towns in Lancaster county, Pennsylvania, may prepare themselves for a jolt. Modern business system magistrates having taught the members of the Lancaster Automobile Club the possibilities of the mail order plan in speed fine commerce, the club has decided to adopt similar tactics in dealing with the people responsible for the condition of the roads. Rural officials who have heretofore regarded their jobs as positions of honor and emolument, without serious responsibility, are to find that the club is right after them with the State law, which places upon them certain obligations concerning the care of roads.

For the opening gun in its letter campaign, the club has prepared a communication, the main text of which is as follows:

"In any township in Lancaster county in which during the month of October the supervisors do not remove and take away the loose stones they will be prosecuted according to the terms of the act of 1901. Inspectors will be sent over the roads on and after November 2 with instructions to report every case of default; and in all such cases actions will be instituted for the recovery of the fine or penalty.

"Supervisors will be expected to erect at all intersections of public roads, handboards legibly inscribed as provided by the act of 1836. On or after October 20th, any supervisors do not remove and take away will be given ten days or more notice; and on or after November 2, suits will be brought to recover the penalty for neglect of duty.

"At the November court of quarter sessions any constable who fails to report any neglect of the above duties by any supervisors or who reports sign boards erected when they are not erected, will have his return challenged and excepted to; objections will be filed against the allowance to him, of any costs or mileage, and due measures will be taken against him for a false return and neglect of duty."

Railroad Man Projects Automobile Line.

Having no street car service, Huntington, Ind., is inclining a favorable ear to the proposition of an automobile transit system for which J. C. Curtis, general manager of the C. B. & Q. Railroad, is asking a franchise from the council. He says that with Chicago capitalists he stands ready to operate four large machines, and that if his company can get the franchise it asks for, it will pay for all improvements and repairs of the pavements on which it runs.

MUNICIPAL AUTOMOBILE EXPENSES

What Maintenance of Cars Costs the City of New York—Engineer Reed Furnishes Some Figures.

That the City of New York is spending an average of $250 a month in the maintenance of each of its motor cars, or about what it would cost as many private owners to maintain cars for their own personal use, was the statement of James W. Reed, an engineer of the Finance Department, who brought up the subject in connection with the Budget Exhibition, which is being held in New York. For some little time Reed has interested himself in the problem of the ownership and handling of the city's cars, and as a result of a very thorough investigation of their use and abuse, he is probably better qualified to give an opinion on the legitimacy of their service than anyone else who is connected with the municipal government.

"That means," he continued, referring to the figures quoted, "$25,000 a month, or $300,000 a year for automobile maintenance. There is a big depreciation, for the average life of these cars is only about two years."

After ennumerating various city departments which have cars and which use them legitimately, he explained that one motor truck in the Board of Education had paid for itself in a year.

"Who buys these automobiles?" he exclaimed. "They are ordered purchased for the most part by the Board of Aldermen without public letting. The reason that there has been, except in three or four instances, no public letting, is that it is particularly hard to draw specifications so as to shut out the bad automobiles. We have been loaded up with some thirty-five kinds of automobiles, of which a great number are the greatest lot of junk imaginable.

"It is true that there are a great many improper uses to which these cars are put, but not necessarily by the city officials themselves. The machines are often used to bring the department head downtown in the morning and to take him and his secretary out to luncheon. Other persons outside have no hesitancy in asking the head of a department to lend his departmental machine. Its use is asked for all sorts of purposes, even for the personal use of the borrowers.

"I have heard of one city car which never turned a wheel all winter in the city service. It was used by a banker, who ought to have been ashamed of himself for asking for it.

"I believe that much of the service to which these automobiles is put is 'joy riding.' But a very small percentage of it is done by city officials, and the city is not being mulct in the purchase of the cars."

In substantiation of the speaker's estimate of the present cost of maintaining the city's cars, figures were shown upon the wall among various other exhibits of a similar nature, giving the cost of operating the cars, which were used by the city officials during the year 1907. These gave a total for the year of $88,433, and revealed the fact that whereas the Board of Assessors had required but $116 for the entire year, the Borough President of Brooklyn, with the several machines under his care, had required $19,433, these being the two extremes of the list. The figures in detail appear below:

Borough Presidents.	
Manhattan	$7,982
Bronx	1,139
Brooklyn	19,433
Queens	2,396
Richmond	5,091
Departments.	
Finance	8,099
Bridges	2,393
Water	5,560
Parks	2,770
Corrections	2,128
Health	9,198
Police	7,633
Street Cleaning	8,166
Fire	4,853
Board of Education	982
Board of Assessors	116
Coroners	165
Sheriff of New York County	178
Total	$88,433

Frelinghuysen Incubating More Law.

Looking with critical eye on the results of his famous New Jersey automobile law, State Senator Frelinghuysen after due deliberation pronounces it good, although he plans an amendment to it which he thinks will help both motorists and farmers by providing the counties with money for giving the highways dustless surfaces. His proposed amendment, announced at a recent political meeting, will provide that 50 per cent. of the revenue derived from automobiles be divided among the counties for the purpose of putting Tarvia or other preparation on the roads. That the amendment is not born of any consuming desire to make things more pleasant for the automobilists Frelinghuysen hastened to make plain by stating that the dust causes immense damage to growing crops and that it was to help the farmers that he wishes the dust-laying applications. As to the plan to expend $10,000,000 for a shore road from Cape May to Atlantic Highlands, the senator is absolutely opposed, on the ground that the roads in rural districts should be improved first.

Few American Cars in Shanghai.

Although the first automobile to make its appearance in Shanghai was of American manufacture, the advantage has not been followed out and at present most of the cars in use are of foreign production. The pioneer vehicle was imported in 1902. Today there are 140 machines owned in the city although only five of them are the property of natives.

PARIS MAY LOSE ITS BIG SHOW

Future of the Salon de l'Automobile Said to be in Doubt—Indifferent Attitude of the French Trade.

"It is freely stated that all is not well with the Paris-Salon de l'Automobile," asserts a British motoring publication editorially, "and that so unsettled are its prospects that its abandonment is possible. Hitherto all space has been allotted before the end of August, and later applicants have had to be squeezed into odd corners or deal through other exhibitors. At the moment, it is said that not merely is plenty of space still unallotted and unapplied for, but extreme pressure is being brought to bear on even well known firms to compel them to take up space under an agreement signed in the early days of the exhibition, to show annually. And it is freely stated that those concerns whose presence is vital to the success of the affair have insisted upon obtaining their floor spaces free of rent. If true, and there is no reason to doubt the very explicit statements made, it is evident that the glory of the Paris show has departed, and that its struggle for a mere existance has begun.

"The French trade, treating and developing their show as a huge retail advertisement and mart, have discovered that that phase has passed, and, in the condition of financial exhaustion which prevails over a considerable section, participation under any other circumstances is not possible or advisable. The French trade cannot afford to spend tens of thousands of pounds on a peep-show for the good people of Paris, and, having come to that decision with a revulsion very characteristic of their country, now take the other extreme, and will not, if they can avoid it, hold a show at all."

Average Life of the Automobile.

With that impressive show of exactitude which the statistician is so fond of, it recently has been figured out that the average life of an automobile is 4.99 years. This interesting result is arrived at by computations based on the public automobile statistics of France, taken from the government registration records, and therefore differs in method of obtaining from estimates derived from purely empiric data. It is shown that in January, 1903, there were 12,984 recorded machines in France and that during the year 6,900 new French cars were sold and 350 cars imported. At the end of the year there were only 17,107 automobiles, however, against the 20,234 that there would have been had all of them remained in service. By taking similar comparisons for the following years, the estimate of 4.99 years as the average period of usefulness for an automobile was evolved, a period that will probably lengthen as the industry advances.

The Week's Patents.

893,738. Two-Cycle Motor. Gotthold L. Langer, Stockton, Cal., assignor to Joseph Geiger, Stockton, Cal. Filed Sept. 19, 1906. Serial No. 335,253.

1. In a motor, a hollow base, a pair of spaced cylinders mounted upon said base and connected at one end therewith, the upper portion of each cylinder being smaller in diameter than the lower portion, said upper portion of each cylinder constituting an explosion chamber, the said lower portion adapted to serve as a pump, passages in the walls of said upper portions, ports through the walls of the cylinders at the ends of said passages whereby communication is established between the enlarged portion of one cylinder and the smaller portion of the other cylinder, the port at the upper end of each passage constituting an inlet for the explosion chamber, an oil intake port and an air intake port for each cylinder, said ports being spaced apart and leading into the aforesaid passages, an exhaust port in the wall of each cylinder, closures at the outer ends of said cylinders and provided with hollow re-entrant heads depending within the cylinders and spaced from their inner surfaces, transverse ports in said heads opposite the air intake ports of the cylinders, pistons operating within said cylinders and provided with guide members operating between said re-entrant heads and said cylinders, and spaced ports in said guide members adapted to be aligned with the explosion chamber inlet ports and the exhaust ports respectively, and enlarged portions carried by said pistons operating in the enlarged portions of the cylinders.

893,794. Flexible and Elastic Shaft Coupling. Leonce Girardot, Puteaux, France. Filed Nov. 20, 1905. Serial No. 288,284.

A flexible and elastic shaft coupling comprising in combination two plates adapted to be fixed respectively to the adjacent ends of the shafts to be coupled, there being two sets of teeth of triangular section made respectively integral with said plates at their circumference and meshing with each other without making contact, each of said teeth being recessed in its outer edge, springs arranged between the side faces of successive teeth, washers located between the ends of the springs and the said faces of the teeth, a movable ring on which are threaded all the springs and washers, said ring lying in the recesses in the teeth, there being spherical bosses formed respectively in the plates and a spherical headed screw screwed into one of the plates and adapted to connect both plates together though admitting their slight inclination one with regard to the other, substantially as described and for the purpose set forth.

893,832. Tire. Herman B. Baruch, New York, N. Y. Filed April 24, 1907. Serial No. 369,904.

1. A tire having an outer tube or shoe, an inner tube comprising a plurality of expansible tube-sections, and flexible parts within said shoe extending between said sections and being loose under normal conditions, said parts permitting said sections to expand to fill space adjacent thereto formerly occupied by a section which has collapsed, but precluding more than a predetermined amount of expansion of said sections, substantially as set forth.

893,858. Brake. Frederick C. Miller, Cincinnati, Ohio. Filed Jan. 28, 1907. Serial No. 354,545.

1. The combination of the stationary and rotary members, one of which is provided with an internal annular braking surface and the other of which carries a pair of intermeshing sectors constructed with eccentrically located and oppositely presented grooves, a split ring surrounded by the internal braking surface and having its extreme ends engaged with and confined by the grooves in the sectors, and means for operating the sectors.

893,867. Automobile. Eugene S. H. Pereyra, Brooklyn, N. Y. Filed Dec. 28, 1907. Serial No. 408,446.

1. In a convertible automobile, a detachable sub-structure, yieldingly connected to said automobile; which substructure may be attached by passing transverse cross rods through holes in the main frame of said automobile and fastening said rods to the frame by nuts substantially as described.

893,955. Spark Plug. Clarence T. Van Woert, New York, N. Y. Filed Aug. 1, 1907. Serial No. 386,639.

1. A spark plug adapted to be used in a substantially upright position, including a core of insulating material having a recess in its lower or inner end, an electrode extending through said core and terminating within said recess substantially flush with the innermost portion thereof, and a second electrode extending into said recess from below and terminating adjacent the end of the first-mentioned electrode to leave a spark gap therebetween, adjacent the innermost portion of the recess, whereby all oils or other liquids are automatically drained away from the spark gap by the walls of the recess and the second electrode, and whereby the first portion of the explosion sweeps said liquids from the recess.

894,014. Rubber Tread or Tire for Wheels. Edward B. Killen, London, England. Filed Oct. 27, 1906. Serial No. 340,867.

1. In a tread or tire, the combination of a floated unbroken boltless inwardly flanged binding circular rim provided with holes at suitable distances apart, a rubber tire having its outside trending circumference molded into studs adapted to fit through and to have their necks surrounded, supported and protected by the walls of the said holes and having its inside circumference molded with inverted dish-shaped recessed air spaces opposite the said studs, and washers adapted to fit and lie fixed in the said air spaces; said washers having screw threaded holes to take the ends of bolts passing through the felly and rim of the wheel proper, all substantially as and for the purpose specified.

894,052. Safety Device for Occupants of Vehicles. Richard Radtke, Suhl, Germany. Filed March 16, 1908. Serial No. 421,526.

A safety device for the occupants of vehicles comprising in combination a plurality of rubber straps forming a closed belt, held on the shoulders in an easily detachable manner by loops and back straps provided with a buckle, as well as of a breast band attached at one side and connected at the other side by means of hooks and chain in an easily detachable manner, two vertical helicai springs being arranged on the seat, to the upper eyes of which the rubber straps are attached by means of easily opened spring hooks so that the springs and the rubber straps exercise an elastic vertical pull on the body of the wearer when it is thrown upwards and forwards by the vehicle striking an obstacle, in such manner that the said wearer is pulled back to the seat.

894,055. Automobile. Cowan Rodgers, Knoxville, Tenn. Filed Dec. 2, 1907. Serial No. 404,773.

1. In an automobile, an extensible frame, and a body horizontally movably mounted upon said frame.

894,060. Motor Vehicle. Richard Ruemelin, Huntingdon, Pa. Filed July 1, 1907. Serial No. 381,608.

1. In a motor vehicle, the combination of a rigid under frame flexibly connected at the front with a horizontally pivoted front axle and its wheels, bearings at the rear portion of the under frame having readily separable portions, axle inclosing shells pivotally mounted in said bearings, rear axle sections rotatably mounted in said shells, driving mechanism therefor removably and resiliently supported on the under frame, and a motor and gearing incorporated with said mechanism and with the axle, said portions comprising a readily removable power equipment for the vehicle, substantially as set forth.

894,079. Tire Holder for Automobiles. Frederic S. Suthergreen, Osterville, Mass. Filed May 16, 1907. Serial No. 374,001.

1. In a tire supporting device, a rod supported for oscilation, tire supporting members connected therewith, a tire clamp, and

means for connecting said tire clamp with a fixed supporting point.

894,084. Tire Tread Chain for Automobile Wheels, etc. James C. Thomas, Corsicana, Tex., assignor of one-half to Frederick W. Barth, Corsicana, Tex. Filed March 22, 1907. Serial No. 363,885.

1. A device of the class described comprising side rings, a flexible band having side seams in which the rings are incased, said side seams being provided at intervals with recesses or openings to expose the rings, and cross chains connected with the rings at the exposed portions thereof and extending across the outside of the band.

894,271. Folding Shield for Automobiles and Other Vehicles. Frank Jackson, Denver, Colo. Filed Aug. 28, 1907. Serial No. 390,468.

1. A folding shield for motor cars and the like, comprising upper and lower members having registering hinge plates at the corners of their adjoining edges and bolts and nuts for connecting and clamping the plates of each hinge in frictional engagement, said hinges permitting said shields to be folded to lie parallel; resilient buffers on said shields which engage when the shields lie parallel; hooks for holding said upper shield against the lower shield; a support adapted to be rigidly secured to the dash board of the car; hinge connections between said support and the lower shield; longitudinally adjustable brace rods, and clamps therefor, pivotally connected to the hinge plates of the lower shield and to the car for supporting said folded sections in either a vertical or a horizontal position; and brackets on the shield support upon which the end of the upper shield rests, when the folded members are in a horizontal position.

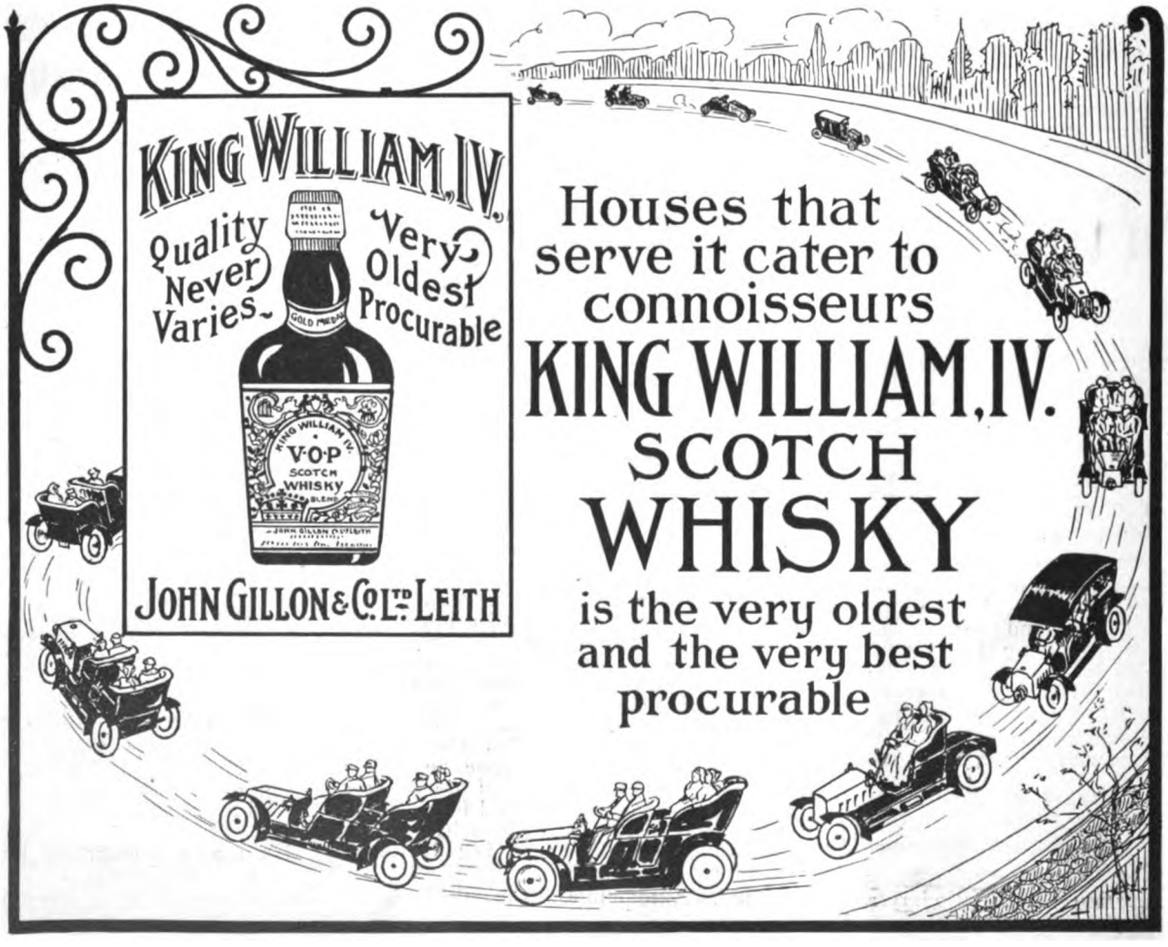
894,276. Vehicle Wheel. Harry M. Martin, Columbus, Ohio. Filed June 10, 1907. Serial No. 378,054.

1. The combination with a vehicle wheel having a pneumatic tire, of a supplemental rim, and a plurality of spaced saddles engaging the pneumatic tire and supporting said supplemental rim.

894,286. Air Intake Regulator for Carburetters. Frederick C. Reineking, New York, N. Y. Filed April 10, 1908. Serial No. 426,180.

In air intake regulators for carburetters, in combination a cylindrical air intake chamber, air ports in the sides of said chamber, one continuous spring inside of said chamber closing said air ports, said spring at all points being free to move back away from said air ports.

894,290. Vehicle Wheel Rim. Edwin C. Shaw, Akron, Ohio, assignor to B. F. Goodrich Company, Akron, Ohio, a Corporation of Ohio. Filed Feb. 20, 1907. Serial No. 358,459.



1. In a vehicle wheel rim the combination of a channel iron, a slot in said channel iron, a removable flange mounted upon a transversely split ring carrying lugs adapted to fit within said slot in normal tension resisting engagement with the end walls thereof, and a locking clamp adapted to engage said lugs and to hold them within said slot.

894,377. Tire Armor or Protector. Charles Filler, St. Johnsville, N. Y. Filed Nov. 20, 1907. Serial No. 403,056.

In combination with a vehicle wheel and a pneumatic tire arranged thereon, an armor, comprising a plurality of shoes, adapted to fit the felly and tire, of said wheel, and having their inner and opposite edges turned up, forming flanges or troughs; yieldable circular wires fitting in said troughs, or flanges, and yieldably connected at their ends by means of bolts, nuts and springs, said yieldable wires adapted to hold said shoes on said felly and tire; extensions or lugs, each provided with a vertical slot, stricken up or rigidly secured near the ends and on the outer face of said shoes; bolts passing through the slots of said extensions; nuts screwed on the threaded ends of said bolts; spiral springs, working between said extensions and said nuts, and straps having one end secured to the lug, formed on said shoes passing thence under the felly and tire of said wheel, with their opposite ends secured to the opposite lugs, said shoes provided with anti-skidding elevations stricken up or secured to the outer faces of said shoes, substantially as shown and described and for the purposes set forth.

894,426. Clutch. David E. Dolson and Elbert R. Pease, Charlotte, Mich. Filed Nov. 25, 1907. Serial No. 403,697.

1. In a clutch, the combination with a shaft, of a rotary member loosely sleeved thereon, a friction drum fixed upon the shaft, a friction band encircling the drum having one end free and the other fixed to the rotary member, a sleeve upon the shaft, a cam associated with the sleeve, a pivoted member in operative relation to the cam, a radially movable member carried by the rotary member extending in operative relation to the pivoted member, and a bell crank lever forming an operative connection between the radially movable member and the free end of the friction band.

Their axles are also our work.

Standard Roller Bearing Co.
PHILADELPHIA, PA.

Will *Your* 1909 Cars Have The Remy Magneto?

If not, you will be with the minority.

Because more Remy High Tension Magnetos *have already been sold* for 1909 cars than all our competititors combined *can sell*. The total to date exceeds 15,000. There must be a reason for this remarkable popularity of the Remy. You will find it in the more than 15,000 Remy Magnetos *now in use*.

More Remy Magnetos have been sold to manufacturers for American-built cars in past seasons than all other magnetos together.

Years of test with all kinds of gasoline motors, under all kinds of conditions, have developed the Remy to the highest degree of efficiency and certainty. And it is the *simplest* magneto made. No brushes to cause trouble, wear out or be replaced.

We are the Oldest Manufacturers of Magnetos in America

Our magnetos were giving splendid service on motors, gasoline tractors, etc., long before the automobile became practicable. The Remy is used in the 200 h. p. gasoline electric steel cars manufactured for the Union Pacific by the McKeen Motor Car Co.

The Remy is used with the powerful engines that operate the big Gerling gangs of fourteen plows in the West. Its efficiency has been proved in many automobile contests, as for instance, by the Buick cars, equipped with the Remy, at Lowell, Mass., on Labor Day, and at Indianapolis, Sept. 18 and 19; by the Cameron at the Dead Horse Hill Climb, Worcester, Mass., June 6th; in the Economy and Hill Climbing Contests at Baltimore, Aug. 7th; by the Knox cars, equipped with the Remy, at Norristown, Pa., Hill Climb, June 27th, Arrow head Hill Climb, New York, July 11th; Shingle Hill Climb, West Haven, Conn., May 27th; Rockville, Conn., Hill Climb, June 30th.

The Remy is used on all the Buick, Maxwell, Apperson, Overland, Cameron, Midland, Nordyke & Marmon, and Haynes cars and more Remys are being specified every day for the cars of other makers.

Write us for illustration and full description of our new magneto. We build them in such large quantities that we can make you very attractive prices. Investigate!

The New Stewart

Model 11. Destined to be the most popular, most attractive, most accurate, most satisfying, and the quickest selling speedometer ever produced.

Model 11 **$25**

Full size 4-in. model. Scale, 0 to 0 miles. Enclosed Season Odometer. Enclosed Automatic Resetting Trip Odometer. Scale 7½ inches long. Equipped with famous Stewart Flexible Shaft and Swivel Joint.

NEW CONSTRUCTION

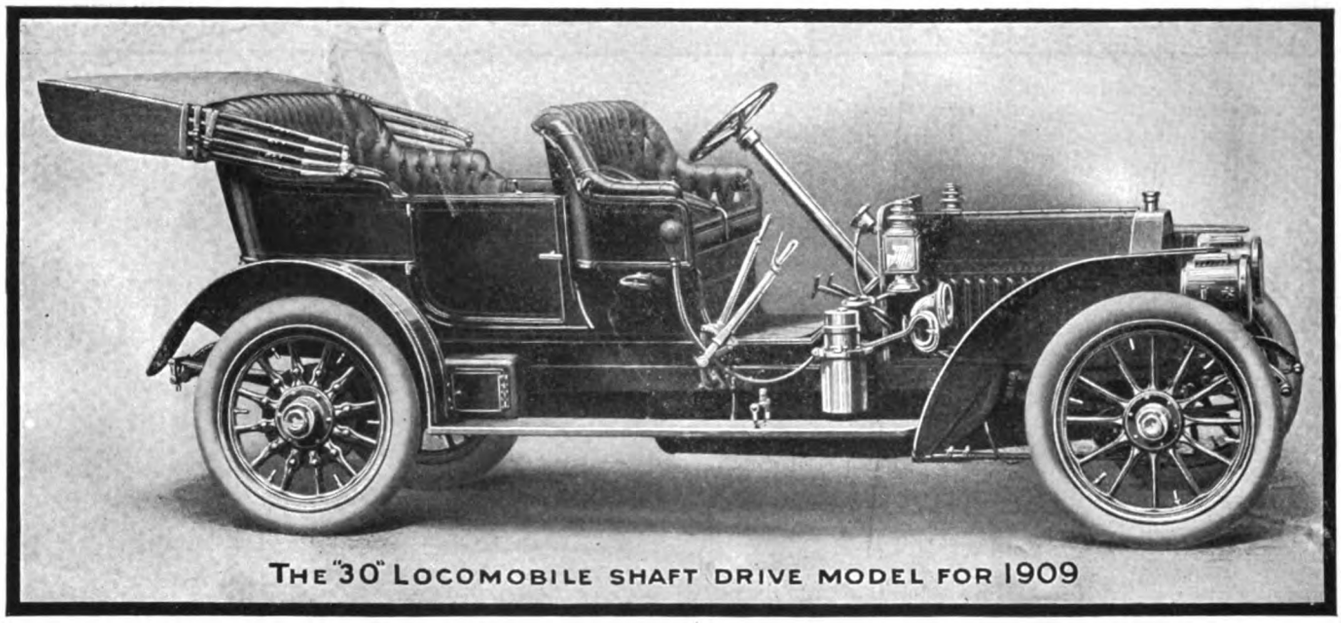
Multipolar Induction Principle

Operating on the induction principle, utilizing the current from a multipolar generator. This construction permits the use of an indicating member of low inertia, thus insuring the most sensitive and accurate reading from 0 to 60 miles.

The needle acts from the center of the dial, which arrangement permits the use of a scale three times as long as ordinarily used, making it the most easily read of all speedometers. It is equipped with a season odometer—capacity 10,000 miles and repeat, also our new trip odometer of three dials, registering miles and tenth, and which may be reset to zero automatically by means of a push button.

The construction is of the costliest kind, every part of the same high standard used in all Stewart Speedometers and includes jewel bearings. The equipment will be the regular Stewart link-type flexible shaft and patented swivel joint, furnished with our highest priced models.

We recommend this exceptional instrument to the motorist who desires the best speedometer that money can buy—the best irrespective of price—who wants a speedometer to indicate the exact speed and correct mileage of trip and season, and do it constantly day after day and year after year.



We stand back of Stewart Speedometers with a Five Year Absolute Guarantee

THE ONLY speedometer built to carry a long-term guarantee

Ready for delivery about November 15th. Send for catalog.

THE "30" LOCOMOBILE SHAFT DRIVE MODEL FOR 1909

THE MOTORING PUBLIC WILL BE INTERESTED IN READING THE FOLLOWING CIRCULAR ANNOUNCING **1909** LOCOMOBILE MODELS WHICH THE **LOCOMOBILE** COMPANY OF BRIDGEPORT, CONN., HAS RECENTLY SENT TO THEIR DEALERS AND CUSTOMERS:

We signalize our tenth anniversary of the production of automobiles by the announcement of two splendid models—undoubtedly the best that we have ever offered to the public.

Ten years ago the Locomobile demonstrated for the first time the wonderful possibilities of the motor car, and gave the automobile business its first great impetus. To-day the Locomobile is held in the highest esteem. It is everywhere regarded as a car of the highest quality—a car of *composite* merit, satisfactory in every respect. It is specially noted for reliability, and experts agree in rating it the most durable car on the market.

The 1909 product will enhance the high reputation the Locomobile has gained.

We announce an entirely new model "30" *Locomobile,* a five-passenger touring car intermediate in power between our "20" and our "40." It will be equipped with shaft drive.

The "40" *Locomobile* should be the logical choice of those who desire a *high powered car.* The "40" will be produced as a seven-passenger touring car, a stylish roadster, and as a closed car with Pullman Limousine or Landaulet body.

This circular will furnish advance information about 1909 Models, until our preliminary catalog is ready.

ADVANCE INFORMATION CONCERNING 1909 MODELS

"40" LOCOMOBILE.

This car is thoroughly typical of Locombile construction and is the most powerful model we have ever built. It is equipped with a four-cylinder motor of 5-inch bore and 6-inch stroke, giving about 60 horse-power on the testing stand, thus affording high speed and fine hill climbing ability. The artillery wheels are 36 inches in diameter; the tires are 36 x 4 inches front and 36 x 5 inches rear. The wheelbase is 123 inches, and the length over all is 16 feet 1 inch.

The "40" *Locomobile* is a splendid touring car for seven passengers and is notable for it beauty of line, luxurious appointments, and delightfully easy riding qualities. It is a touring car par excellence and will meet any test of endurance to which it can be subjected. *Price, with lamps and equipment,* $4,500. *Top extra.*

The "40" *Runabout,* brought out near the close of the 1908 season, will be an attractive feature of the 1909 production. The body is very attractive and accommodates four passengers, all seats being very

Digitized by Google

comfortable and easy riding and convenient of access. The individual front seats are fixed; the rear seats may be removed or only one or both can be used, making the car available for two, three or four passengers as desired. The "40" Runabout can also be supplied with the type of body known as the "toy" or "baby" tonneau, and which enjoys considerable popularity. *Price, with standard body or "baby" tonneau, including lamps and equipment,* $4,500. *Top extra.*

The "40" Limousine and the "40" Landaulet are both beautiful high-powered closed cars. The bodies are roomy, beautiful in design, of the best possible workmanship and finish, and are equipped with extra Pullman chairs. *Prices of these closed cars announced later.*

"30" LOCOMOBILE.

This model is equipped with a four-cylinder motor of 4½-inch bore and 4½-inch stroke, giving about 38 horse-power on the testing stand. As the new model is intermediate in size between the "20" of former years and the "40" Locomobile, it is rated as a "30."

The car embodies all of the special features which have for years identified the Locomobile, such as low tension ignition; bronze engine base and gear box (much stronger than aluminum commonly used); alloy steel in the crankshaft, steering gears, transmission shafts, pressed steel frame, gears, and other important parts; heat-treated drop-forgings of our own manufacture; four-speed selective transmission; imported ball-bearings in wheels, gear box, and other important places. The wheelbase is 120 inches, yet the car can be turned in a 38-foot street. The length over all is 15 feet. The wheels are 34 inches in diameter, tires are 34 x 4 inches front and 34 x 4½ inches rear.

The body is graceful in design and very commodious, seating five adults with entire comfort. *Price of the "30" Locomobile touring car, as illustrated with lamps and equipment,* $3,500. *Top and speedometer extra.*

Another variation of the "30" Locomobile is the "30" *Runabout,* a roadster of the latest type with sharply inclined steering post and equipped with a body similar to that of the "40" Runabout, and which may be used for two, three or four passengers as desired. It will also be supplied with the "baby" tonneau. *Price, with lamps and equipment,* $3,500. *Top extra. Prices of closed cars announced later.*

A feature of the new "30" chassis is the use of shaft drive, the details of which are described in the following paragraphs:

LOCOMOBILE SHAFT DRIVE CONSTRUCTION

We have long appreciated that shaft drive has some very desirable features when applied to a car of the size of the "30" Locomobile. Our new shaft-driven car is fully equal in reliability and lasting qualities to our famous chain-driven cars, and we believe that it combines more good features than any other car on the market, whether of foreign or American design. Some of these features are as follows:

1. *Complete removal of all torsional stresses from the car axle tubes.* Distance rods, similar to those on our chain-driven cars, transmit the driving stresses to the frame and maintain parallelism of the front and rear axles. These distance rods carry the brakes, and their rear ends are free to turn on the axle tubes. Consequently when the springs are depressed the distance rods turn on the axles and do not twist them. Also, when the brakes are applied the braking stresses are not communicated to the rear axle or driving mechanism. Also the power is not transmitted through the springs.

The spring chairs are also free to turn on the axle tubes, and thus the only duty of the springs is to carry the load. This arrangement makes the Locomobile shaft drive car a very easy riding one, in addition to removing all torsional stresses from the rear axle tubes.

All brakes are enclosed and protected.

2. *Exceptionally strong rear axle construction.* The axle tubes are of alloy steel with inner ends forced into the openings of the differential housings by hydraulic pressure and securely riveted in place. Unlike many or most cars, no brazing whatever is used. It will be noted that our form of construction would be the strongest possible in any case, but owing to the removal of all torsional stresses from the tubes it is really very much stronger than necessary. There is no tendency for the tubes to loosen in the housing.

3. *Straight line drive.* When the car is loaded the propeller shaft is almost exactly horizontal—thus the power of the motor is transmitted in a straight unbroken line to the rear axle, thus eliminating loss of power through the universal joints.

4. *Complete universal action.* The propeller shaft is not only horizontal, but is provided with a universal joint at the front end and a *slip universal joint* at the rear end. The latter compensates for any change in distance between the rear axle center and the gear box. The two universal joints compensate for all other stresses as well, so that the transmission of power from the motor to the rear axle is perfectly accomplished without any binding or straining under any road conditions. As the propeller shaft is horizontal, there is very little action on the part of the universal joints, and very little power absorbed by them—furthermore, as the joints are of the best construction, fully protected and lubricated, the *wear* is reduced to a minimum.

5. *Flexible drive.* A torsion rod is provided to overcome the torque reaction of the bevel driving gears. The rear end of this rod is made fast to the differential housing and the front end is connected to the cross member of the chassis frame by a spring suspension. When the car is started in either direction the springs are compressed and the torque reactions are absorbed, reducing the tendency to raise the body when the car is started. Thus the drive from the motor to the rear wheels is a flexible one—a most desirable feature.

6. *Truss rods.* Diagonal tension rods extend from the lower part of the differential housing to the outer extremities of the rear axle tubes. These truss rods transmit the stresses to the wheels instead of permitting them to be concentrated at the center of the axle. This form of construction produces an axle of moderate weight and maximum strength.

7. *Excellent design for driving axles.* The driving axles are of the floating type and rotate inside of the axle tubes. As the weight is all carried on the tubes, the axles only have to transmit the power. The inner ends have a square fit into the differential bevel gears and the outer ends are in the form of dogs or jaw clutches integral with the axles. These engage with the hubs of the wheels, affording an absolutely positive drive and at the same time making it possible to remove the driving axles at any time by simply removing the hub caps.

Summary. It will be seen that the Locomobile shaft drive construction runs very nearly parallel to the Locomobile chain drive construction, and that every weak spot in the shaft drive has been studied and overcome. The most exhaustive road tests have proven most conclusively the durability and lasting qualities of the new Locomobile shaft drive.

LOW TENSION IGNITION

Locomobile low tension ignition adopted in 1905 will be continued. We have had four years' experience with high tension ignition and an equally long trial of low tension ignition, and the results indicate that the latter is far superior in reliability. The Locomobile low tension system differs from the ordinary make-and-break on account of the simplicity of the design and the use of iridium contacts, which does away with frequent and unnecessary timing of the igniters. Locomobile low tension ignition is superior to any form of jump spark on account of the fact that the electrical problem is infinitely more simple and enables the simplest type of magneto to be employed. Furthermore, our system is superior to the high tension ignition because there is no danger from short-circuiting and no complicated wiring—nothing but a few feet of low tension cable.

Matheson

1909

Prices Reduced $1,000

And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for **the best.**

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still **maintain the unequalled quality** of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by **doubling the factory output** and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital **has been increased by** $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, **at the makers' former prices to the agent or dealer;** namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5,500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

MATHESON AUTOMOBILE COMPANY

FRANKLIN

Weight is what wears out tires.

In a paper read before the French Society of Civil Engineers, M. A. Michelin, the noted tire expert, says:

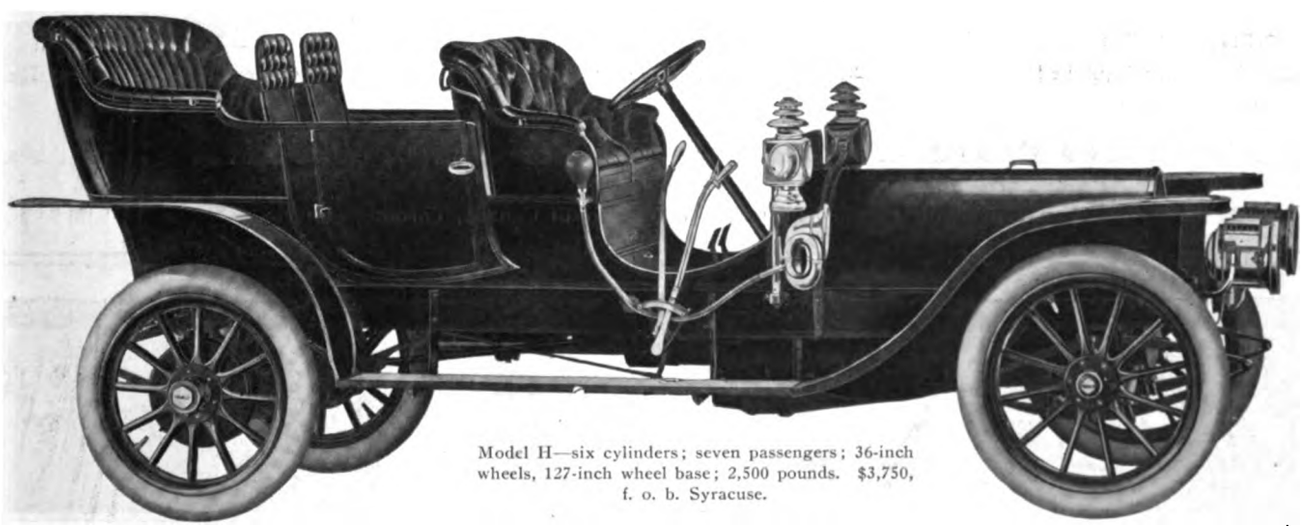
"If the weight of an automobile is increased five per cent., it increases the wear and tear on tires fifteen per cent."

This means that the average water-cooled automobile with its extra weight of plumbing apparatus—and weighing, as it does, a third more than a Franklin model of the same capacity—wears out tires just twice as fast.

The light weight of Franklin automobiles and their large wheels and tires eliminate the tire bugbear from automobiling. No other automobiles have such large wheels and tires in proportion to their weight.

Model D weighs only 2100 pounds, yet it has the same size wheels and tires as other automobiles weighing 3200 pounds and upward. Model H has larger wheels and tires than some automobiles a thousand pounds heavier. The larger the tires, the greater their wearing surface and the longer they last. But no tires made are large enough to offset the wear and tear put upon them by the bulky heavy water-cooled machines.

You cannot reduce tire expense nor fuel expense to a reasonable figure in a heavy automobile.

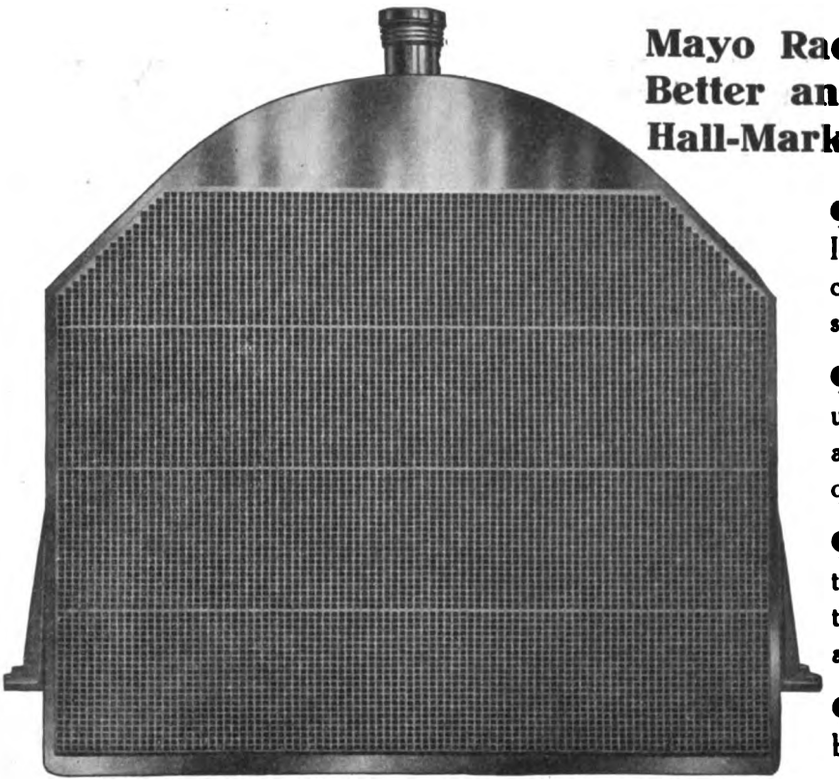


You cannot get the same refinement and simplicity—the combination of power and strength with light weight except through Franklin air-cooling.

What would it mean to you to get rid of tire trouble and at the same time cut the bills down half? Nothing could induce a man who has once known the comfort and security of the light-weight air-cooled Franklin to drive or own a heavy automobile.

Before you buy, think of tires; and of all the burden and trouble that go with useless weight.

Write for the catalogue describing the complete line of Franklin automobiles, four and six cylinders, 18, 28 and 42 h. p., runabouts, touring-cars, town-cars, broughams, landaulets, limousines.



H. H. FRANKLIN MANUFACTURING CO., Syracuse, N. Y.

Model H—six cylinders; seven passengers; 36-inch wheels, 127-inch wheel base; 2,500 pounds. $3,750, f. o. b. Syracuse.

Model H is the most refined six-cylinder automobile in the world—powerful, smooth, simple. There is not another large touring-car so comfortable and safe to ride in, and so economical to use. And in appearance and details it has no superior.

The Truth About the Reduction in Tires

Some tire manufacturers, working in collusion, tell you that they are able to reduce the prices of their tires owing to a reduction in the cost of crude rubber.

It is a peculiar fact, however, that **other rubber goods** manufactured by these same firms **have not changed in price** for years.

Another of their arguments is "Increased Capacity"—and right here it may be interesting to note the prices of these concerns on September 1st., 1906, as compared with the present figures:

	Sept. 1, 1906.	Sept. 1. 1908.
28 x 3 in. tire complete	$34.32	$17.55
30 x 3½ in. tire complete	48.39	27.25
32 x 4 in. tire complete	60.00	38.80
32 x 4½ in. tire complete	73.35	49.20

Do you think increased capacity should make this difference? No!

Could the reduction be brought about through a reduction in the price of crude rubber? Yes. **But has rubber really been reduced?**

Crude Fine Up-River Para Rubber is at least **20 per cent. higher to-day than it has been any time for the past twelve months.** PECULIAR CONTRADICTION, isn't it? NOW FOR THE FACTS.

On August 12th, 1908, we refused to accept the proposition advanced by our competitors, to **muzzle free competition** in the tire trade by agreeing to adhere to a uniform discount—a scheme by which they attempted to recover from **dealers** and **consumers** and **losses entailed** by the conduct of their business in other quarters.

We were opposed to the Tire Pool; it was **we who fought it** and saw it "BUST" on September 1st, 1906, and we are still **opposed to every kind of tire combination.**

This short statement tells the TRUE story and the TRUE PURPOSE of the recent price reduction, which is to

Drive Out Competition

—Ajax competition we might add.

At the present prices of raw material neither the product of our competitors nor Ajax tires can be sold at the profit that is **legitimately** due the manufacturer. But in offering our own tires at correspondingly reduced prices we simply fight back with the **pocketbook argument.**

As far as our competitors are concerned, we warn the tire using public to

Look Out for the Cut in Quality

that usually accompanies the cut in price.

AJAX TIRES

ARE GUARANTEED FOR 5,000 MILES

A certificate signed by the President of our Company, and bearing the number of the tire, accompanies **every tire** sold, and on the back of the certificate is a table of adjustments by which every user of Ajax tires can compute the charge should a replacement be necessary.

There is no better recommendation for a tire than our 5,000 mile guarantee, because it puts the **burden of proof upon us** and we MAKE GOOD.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. THE BRAMPTON CHAIN is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMPTON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

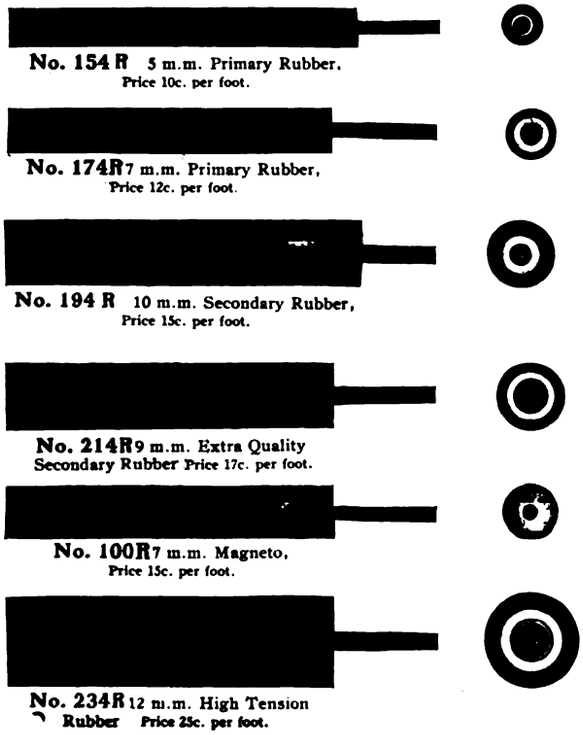
CAUTION

The demand for PIRELLI CABLE (Italian Ignition Wire—rubber covered) has become so general, that competitors have thrown all kinds of imitations on the market.

In order that the automobile manufacturers as well as the users may be safeguarded against worthless imitations, we point out



HOW TO TELL THE GENUINE

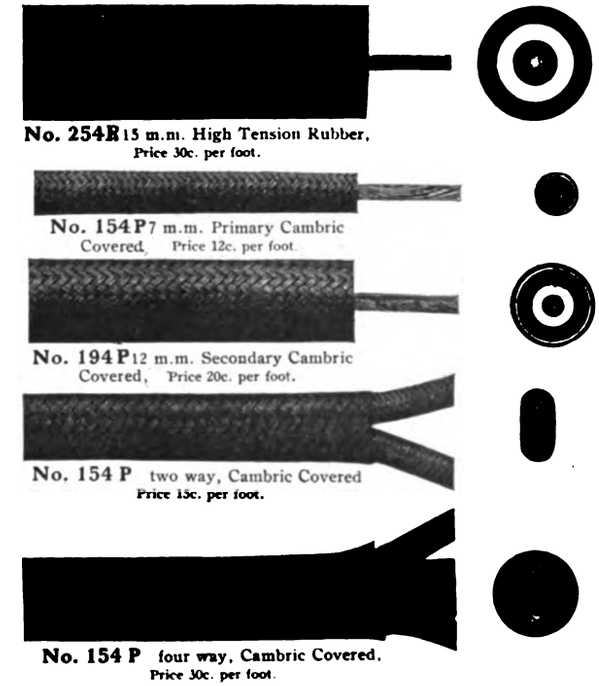
Cut off a section—an inch or less—from the cable you are investigating. Pull it off the wires and cut it open lengthwise. **If you can separate the different layers of vulcanized rubber, or if the rubber cracks from bending it back and forth and squeezing it, YOU HAVE AN IMITATION.**

The reason **PIRELLI CABLE will not crack,** is because **it is not moulded, but drawn in endless lengths, and all the layers of rubber are vulcanized as a unit.** Some manufactures in order to hide the mould marks, cover it up with a sheet of rubber before vulcanizing.

The Genuine PIRELLI Costs No More than the Imitations

therefore you have no reason to be imposed upon. We will be pleased to send a small section of **Pirelli Cable** to any one interested—for comparison. These are the different sizes for different uses:

No. 154 R 5 m.m. Primary Rubber, Price 10c. per foot.



No. 174R 7 m.m. Primary Rubber, Price 12c. per foot.

No. 194 R 10 m.m. Secondary Rubber, Price 15c. per foot.

No. 214R 9 m.m. Extra Quality Secondary Rubber Price 17c. per foot.

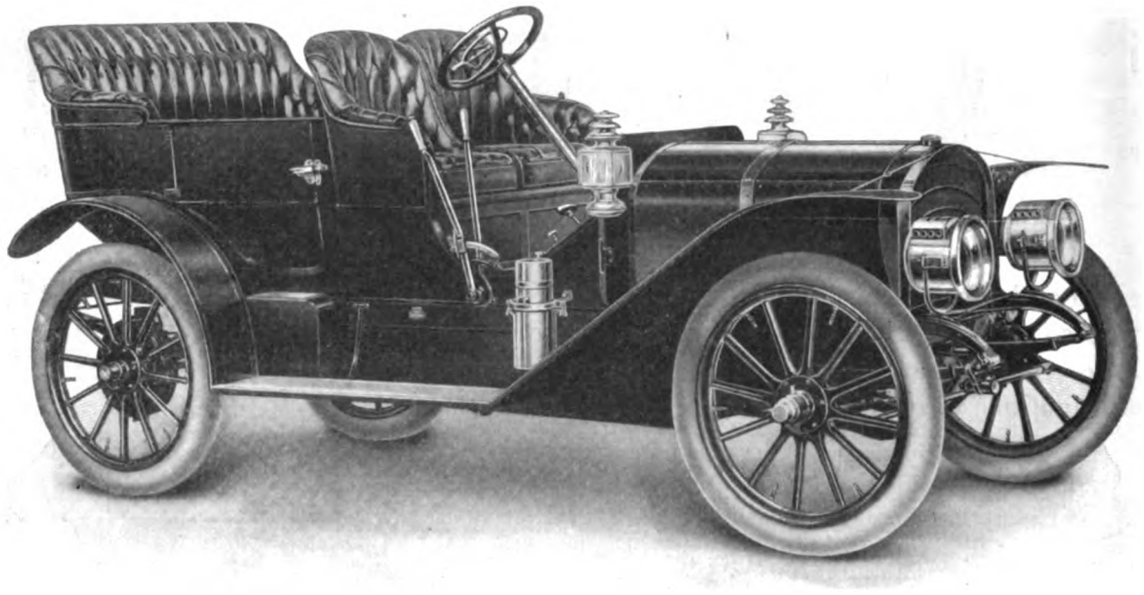
No. 100R 7 m.m. Magneto, Price 15c. per foot.

No. 234R 12 m.m. High Tension Rubber Price 25c. per foot.

No. 254R 15 m.m. High Tension Rubber, Price 30c. per foot.

No. 154P 7 m.m. Primary Cambric Covered, Price 12c. per foot.

No. 194P 12 m.m. Secondary Cambric Covered, Price 20c. per foot.



No. 154 P two way, Cambric Covered Price 15c. per foot.

No. 154 P four way, Cambric Covered, Price 30c. per foot.

TO AVOID IGNITION TROUBLE, SPECIFY PIRELLI WIRE.

PIRELLI & CO., 296 Broadway, New York

Model 34, Price $2,250

Two Vital Features of This Car.

THE offset crank shaft and straight line drive, more than any other features are responsible for the unusual efficiency, the high delivered power and the wonderful flexibility of control of this four cylinder, five passenger

Rambler

Most automobiles can develop sufficient power at high speed, but the owner's greatest need is for power at slow engine speeds—power on the hills—in stretches of sand and mud.

The offset crank shaft and stright line drive give flexibility, allow more high gear work without overtaxing the engine; that means less gear changing; less clutch manipulation—therefore ease and economy of operation.

This car can be throttled down to operate smoothly and steadily on high gear at three miles an hour. Or it can run forty-five miles an hour.

These features besides those big wheels, big tires, long wheel base, accessible engine, safety starting device, reinforced tubular axle, finished parts of genuine mahogany, perfect brake control, and large luxurious body, make this a car of highest quality.

Ready for immediate delivery. Please write for details now.

Thomas B. Jeffery & Company, Main Office and Factory: **Kenosha, Wis.**

Branches and Distributing Agencies: Chicago, Milwaukee, Boston, Philadelphia, San Francisco.

Representatives in all leading cities.

Volume XIX. New York, U. S. A., Thursday, October 29, 1908. No. 5

HOADLEY HAS A MERGER SCHEME

Prominent Makers Solicited for "Options" —Promoter Encounters Difficulties in the Terms Asked.

Quite aside from the companies that have been prominently mentioned as about to join in a huge consolidation, a number of the largest makers have for some time been solicited for "options" by various Wall street gentlemen whose business it is to consolidate and juggle with sundry and various industries with the result that these same gentry have been treated to some interesting surprises. After selecting a list of the most promising plants, Joseph H. Hoadley, of the firm of Hoadley & Knight, which has New York City as its headquarters, has interviewed their owners with a most attractive appearing plan for a merger that is calculated to make everybody connected with it "rich beyond the dreams of avarice." Hoadley knows the economic advantages of consolidation, especially for himself, and is fluent with figures and roseate verbal pictures of what it can accomplish for the manufacturer who finds himself annoyed by competition.

As guiding spirit in the fragrant International Power Co., the stock of which was removed from the New York stock exchange list, he is familiar with large corporation matters. It is true that one of his lieutenants, after giving orders to sell 3,000 shares of the stock, neglected to arrange for its being bought in at the same time, so that without a prepared buyer the shares fell a full 100 points, causing some commotion at the time, but such incidents have simply contributed to an enrichment of Hoadley's fund of business experience, and but the better prepare him for the future.

In seeking his "options," however, it is understood that he has encountered a most obstinate spirit on the part of the automobile manufacturers concerning the terms that they will accept for their properties. Where in other lines it has been possible to exchange magnificently engraved pieces of parchment paper for real factories, goods, patents and materials, the stubborn and hard-hearted—not to say hard-headed—manufacturers of motor cars have insisted on discussing in terms of actual dollars, thus embarrassing the negotiations in no small degree. The stiff prices asked would not in themselves constitute a difficulty were it not that the payment would have to be in cash or satisfactory guaranteed or mortgage notes, the cold insistence on which has been made with discouraging firmness.

In fact throughout the list, this demand has been so general that the consolidation scheme has latterly halted to some extent, but should the makers later find themselves in a position where they want to be "saved" and will relax from their absurd position, Hoadley and others of his kind will cheerfully take up the work.

McCord Moves from Chicago to Detroit.

McCord & Co., of Chicago, Ill., are removing that portion of their factory devoted to automobile supplies, to Detroit, Mich. The action follows troubles with the Windy City's tinsmiths' union. Factory space has been obtained from the Hugh Wallace Co. in Detroit, where the work formerly carried on at the Kinzie street plant in Chicago will be transferred as soon as possible.

American Automart in Bankruptcy.

Bankruptcy proceedings were instituted this week against Max Wineburgh, who has been doing business as the American Automart, at 1621 Broadway, New York City. The liabilities are estimated at $10,000, and the stock of automobile supplies in the store and the garage are said to about equal this amount.

Mercury to be Made in Hillsdale.

The Mercury Motor Car Co. has been organized at Hillsdale, Mich., with $50,000 capital, and has its first cars under construction. J. W. Raymond is the president and general manager of the concern.

NOT WELCOME AT PALACE SHOW

No Space for the Two Makers at Odds with the Licensed Association—Ford's Prompt Ultimatum.

Instead of a warm welcome for manufacturers who were this year omitted from the roster of exhibitors at the Madison Square Garden show to be given by the Association of Licensed Automobile Manufacturers, the "independent" makers have manifested a strong dislike for their society in the Grand Central Palace show of the American Motor Car Manufacturers' Association. Tentative efforts to provide for them in the latter exhibition after their relations with the A. L. A. M. had become so strained as to make it apparent that they would not be awarded space in the Licensed affair, aroused vigorous protest from more than one of the "independent" makers, and resulted in an ultimatum to the show management that was so strong as to stop further consideration along such lines.

Without mincing matters, Henry Ford, president of the Ford Motor Co., of Detroit, Mich., came out with a declaration that if the two companies who were no longer to be exhibitors in the Licensed fold were given space at the Palace show, his company would be conspicuously absent and that the management might sell his space to somebody else. Ford's position in the "independent" field gives force to his wishes, and the plan to make room for the newcomers was quickly abandoned. As a consequence the two companies will for the first time in their history, be unrepresented at either of the big New York shows.

Hall Leaves the Badger Brass.

Charles M. Hall, who has for several years represented the Badger Brass Mfg. Co., of Kenosha, Wis., on the road, has parted company with that concern. He is to be general sales manager of the American Lamp Co., of Detroit, Mich.

Digitized by Google

The Week's Incorporations.

Mansfield, O.—Standard Auto and Transit Co., under Ohio laws, with $10,000 capital.

Pittsburg, Pa.—Mutual Motor Car Co., under Pennsylvania laws, with $10,000 capital.

Philadelphia, Pa.—S. & G. Motor Car Co., under Pennsylvania laws, with $20,000 capital.

Dayton, O.—Dayton Motor Car Co., under Ohio laws, increases capital from $50,000 to $500,000.

Cleveland, O.—Derain Motor Co., under Ohio laws, with $30,000 capital. Corporators—J. J. Murphy and others.

Los Angeles, Cal.—Los Angeles Auto mobile Livery and Sight-Seeing Co., under California laws, with $75,000 capital.

Milwaukee, Wis.—Gove Automobile Co. under Wisconsin laws, with $5,000 capital. Corporators—Richard Gove, E. G. Gove and J. Carroll.

Indianapolis, Ind.—Best Automobile Co., The, under Indiana laws, with $20,000 capital. Corporators—Edgar Updyke, William N. Gates and Edward E. Gates.

Oklahoma City, Okla.—Tulsa Motor Car Co., under Oklahoma laws, with $10,000 capital. Corporators—T. C. Ferguson, C. L. Ferguson and J. B. Bartlett.

Newark, N. J.—Jackson Motor Car Co., under New Jersey laws with $100,000 capital. Corporators—Charles E. Oathout, Newton A. Merritt and Walter F. White.

Los Angeles, Cal.—Los Angeles Motor Car Co., under California laws, with $50,000 capital. Corporators—Ralph J. Leavitt, La Bree Leavitt and Nathan P. Bundy.

Minneapolis, Minn.—Bingham-Jordan Automobile Co., The, under Minnesota laws, with $50,000 capital. Corporators—George Bingham, T. C. Jordan and Eva Bingham.

Elmira, N. Y.—Southern Tier Motor Co., under New York laws, with $25,000 capgines. Corporators—G. W. Shoemaker, C. S. Lattin, Elmira; H. K. Crandall, Athens, Pa.

Denver, Col.—Independent Automobile Repair Co. under Colorado laws, with $5,000 capital. Corporators—John E. Button, George E. Siegel and James L. Glendining.

Nashville, Tenn.—Tennessee Auto Co., under Tennessee laws, with $13,000 capital. Corporators—J. K. Polk, Jr., J. J. Vertrees, Jr., W. O. Vertrees, Buford Duke and W. J. Wallace.

New York City, N. Y.—International Taximeter Motor Cab Co., under New Jersey laws, with $100,000 capital. Corporators—M. Sergey Friede, Joseph Thomas and John R. Turner.

Winston-Salem, N. C.—H. I. Riggins Livery Co., under North Carolina laws, with $100,000 capital; to deal in and rent automobiles. Corporators—H. I. Riggins, Swift Hooper and W. G. Crawford.

Los Angeles, Cal.—Road Runner Auto Co., under California laws, with $1,500,000 capital; subscribed $5,000. Corporators—C. A. Markwell, M. H. Magie, M. D. L. Scott, A. E. Yerkes and John D. Works.

Cleveland, O.—Auto Purchasing and Exchange Co. The, under Ohio laws, with $10,000 capital. Corporators—Francis J. Wallace, J. C. Heald, C. A. Hall, M. H. Castle and Charles C. Clarke.

New York City, N. Y.—Non-Fluid Oil Co., under New York laws, with $50,000 capital. Corporators—Thomas A. Matthews, Walter F. Kimball and Frederick J. Barnes, 14 Church street, New York City.

New York City, N. Y.—Automobile Tire Co., under New York laws, with $10,000 capital. Corporators—Edward C. Griffith and Mary P. Griffith, 1584 Broadway; Geo. L. Lewis, 42 Broadway, New York City.

Boston, Mass.—G. H. Pixley Co., under Massachusetts laws, with $50,000 capital; general automobile business. Corporators—C. H. Tebbetts, president, Marshfield, Mass.; G. H.Pixley, treasurer, Dorchester, Mass.

Columbus, O.—Broad-Oak Automobile Co., The, under Ohio laws, with $10,000 capital; to trade in automobiles. Corporators—S. W. Knouse, M. F. Loofbourrow, O. W. Loofbourrow, D. T. Hock and Charles Pavey.

Bridgeport, Conn.—Blue Ribbon Garage, The, under Connecticut laws with $10,000 capital. Corporators—Johannes Schiott, William E. Seeley and John T. King; C. A. Clark, president, and Julia G. Hoyt, secretary and treasurer.

Denver, Col.—Elkhart Motor Co., The, under Colorado laws, with $10,000 capital. Corporators— Martin E. Crane, Willard W. Sterling and Charles L. Monger, of Elkhart, Ind.; Augustus J. Sears and Wilford M. Oleen, of Denver, Col.

Uppercu Buys Cadillac's Agency.

By the sale of all the capital stock of the Detroit-Cadillac Motor Car Co., of New York City, to Inglis M. Uppercu, the latter on Tuesday, the 27th inst., became the company's proprietor and will hereafter direct its affairs. The concern has the New York City agency for all the lines of the Cadillac Motor Car Co., of Detroit, Mich., which latter company owned the entire control until purchased by Uppercu. The new owner is well known to the trade as the secretary and treasurer of the Motor Car Co. of New Jersey, having its headquarters in Newark, N. J.

Carrying out plans previously formulated by the company, Uppercu will assume the lease of the new salesroom and garage at Broadway and Fifty-seventh street, which will be opened about November 1. Ernest H. Brandt, who has been the manager of the company, is now secretary and general manager, while Uppercu is president and treasurer.

In the Retail World.

North Bend, Neb., boasts its first garage. George C. McVicker and Mason Howard are the proprietors.

The Wisconsin Automobile Exchange, of Milwaukee, Wis., is building a new garage. It is located at 241-3 Wisconsin street.

Hampton, Ia., is to have an automobile supply station and garage. T. C. Miller will be in charge, and C. F. Roemer will be associated with him financially.

E. De Camp has taken the building formerly occupied by the Livingston Motor Co., at 284 Halsey street, Newark ,N. J. He will operate it as a garage.

The Borderwisch Automobile Co., of Dayton, O., has filed a certificate with the secretary of state changing its name. It is now the Ohio Automobile Co.

Work has commenced on the new Moriarty garage in Kansas City. The reinforced concrete, three-story building is being erected at 1508-10 Grand avenue.

Charles Bauch has leased a garage building which is being put up in Maquoketa, Ia. The structure will be finished on December 1, when Bauch will open for business.

The business of the Jamaica Plain Garage Co., on Seaverns avenue, Jamaica Plain, Mass., has been bought by Samuel Payson. The new proprietor will shortly erect a larger garage building.

William A. Arnold and W. E. Schmick have formed an automobile supply company in Hamburg, Pa. It will be known as the Hamburg Motor Supply Co., and will soon erect a large garage.

F. L. Thomas has been made permanent branch manager of the Franklin Automobile Co., 1450 Michigan avenue, Chicago, Ill. He has for some time been occupying the position of acting manager.

A Philadelphia branch of the Olds Motor Works, of Lansing, Mich., is being opened on North Broad street. Sub-branches are to be established in the smaller cities and towns in the territory assigned to the Quaker City office.

The Hills Motor Car Co., formerly located at 130 North Broad street, Philadelphia, Pa., has changed its location to a larger establishment at 604-6 North Broad street. The garage and repair shop will remain at 246 North Juniper street.

The Johnson Auto Co., of Vincennes, Ind., of which M. T. Johnson, local automobile dealer is the leading spirit, has planned the erection of a large garage for livery and storage. It will be two stories high and will have a competent repair shop.

Nute & Keena, Seattle, Wash., have secured the northeast corner of Bellevue avenue and East Pike street for a one-story concrete garage and automobile salesroom. The structure is planned to provide for the later addition of further stories if necessary.

COULD BUILD WONDERFUL CARS

Knowledge Born of Experience Would Preponderate Over Theory in This Factory—But Money is Needed.

Let all the present automobile makers boast about their designers and their factory superintendents and their experienced machinists, but make them tell, if they will, who could build the best automobiles in the world if only they set about it. Who is it that by their experience in driving cars, repairing cars, smashing cars and tuning cars, not to mention washing them, could design and build cars that would make the present productions look pitiful by comparison? And the answer is wafted from Louisville, Ky., that it is the chauffeurs. Of course even before the answer comes from Louisville, some discerning minds have already guessed it, but they may not know that the chauffeurs are preparing to prove it

Already the plans have advanced to a point where the Professional Chauffeurs' Association is holding meetings to promote a factory where they can make touring cars, runabouts, doctors' callabouts, taximeter cabs and delivery wagons which will incorporate the features and ideas which combined chauffeuring experience suggests. At least one car has been built after this fashion and named in honor of the king of drivers, "Nazarro," and although it was not constructed in the big plant of the chauffeurs' association, because that plant is not built yet, it nevertheless has been decided upon as a model for one of the many styles that will emanate from the chauffeurs' factory if the investing public does not prove to be a set of "tight-wads" when it comes to helping the enterprise along.

If cars, why not tires? Sure! Tires, too, are to be made at the projected plant. Who is it that knows all there is to be known about tires? (Answer from Louisville same as in first paragraph). Having heard that there is a great deal of graft in tires as marketed at present, resulting in high prices to the owner, the chauffeurs' association will produce tires at the prices at which they ought to be sold, and will make them so durable that chauffeurs need actually buy only one set out of every six that they tell the owner they need the money for. Of course the tire department will not be started until the car making part of the outfit is running smoothly, and the latter will not be started until the factory is built, and the factory construction will not be started until somebody supplies the money, and the money supply has got to be started somehow, and so that is why the association has started holding its meetings.

Adopts "Inter-State" as Its Title.

After temporary anonymity, pending the selection of a name by means of a prize contest, the automobile concern headed by Thomas Hart in Muncie, Ind., has decided to call itself the Inter-State Automobile Co. The new factory buildings, which are largely of glass, are being completed, and it is planned to produce 1,000 cars during the coming year.

Must File Pope Motor Car Claims.

Creditors of the Pope Motor Car Co. are being notified that November 1 is the last day on which they may prove and file their claims against the company, and that should they fail to take such action on or before that date, they will be barred from participation in the assets. Claims are to be filed at Toledo, O., with the clerk of the United States circuit court for the northern district of Ohio, western division, where the company's legal affairs center.

Credit Association's New Feature.

The Automobile Trade Credit Association, with offices at 80 Wall street, New York City, has instituted a new feature in a committee to handle the claims of members against bankrupt concerns. The committee will endeavor to effect economies and obtain settlements that in many cases would not otherwise be possible. Twenty-two automobile and accessory concerns have recently been added to the membership.

Henry and Porter Part from E-M.F.

Dave Henry has resigned as traveling representative of the E-M-F Co., of Detroit, Mich., as has J. D. Porter. Their duties in the West and the East, respectively, in arranging for the distribution of the company's product became very light as a result of a heavy demand for the cars.

Motor Car Broker is a Bankrupt.

Charles I. Scott, of 1779 Broadway, New York City, who has been doing business as an automobile broker, has filed a voluntary petition in bankruptcy. There are fifty creditors and his liabilities amount to $19,936, with no assets.

Burned Many Automobile Bodies.

Fire damaged the stock and plant of the George T. Stehling Wagon and Truck Mfg. Co., of Milwaukee, Wis., recently, to the extent of $5,000. Automobile woodwork on the second floor was the chief contribution to the flames.

Burgess Builds a Spring Factory.

Wenona, Ill., is to have a new manufactory, where "double tension" automobile springs are to be made. A brick building is being constructed for Charles Burgess, Jr., the inventor and backer of the enterprise.

Economy to Move to Joliet.

The Economy Motor Buggy Co., formerly of Fort Wayne, Ind., is removing to Joliet, Ill., where local capital has been interested. Ground has been broken for a spacious two story brick factory in East Cass street.

POPE CREDITORS ARE WAITING

Reorganization is Close at Hand—Provides for All Claims—Date is Set for the Hearing Before the Court.

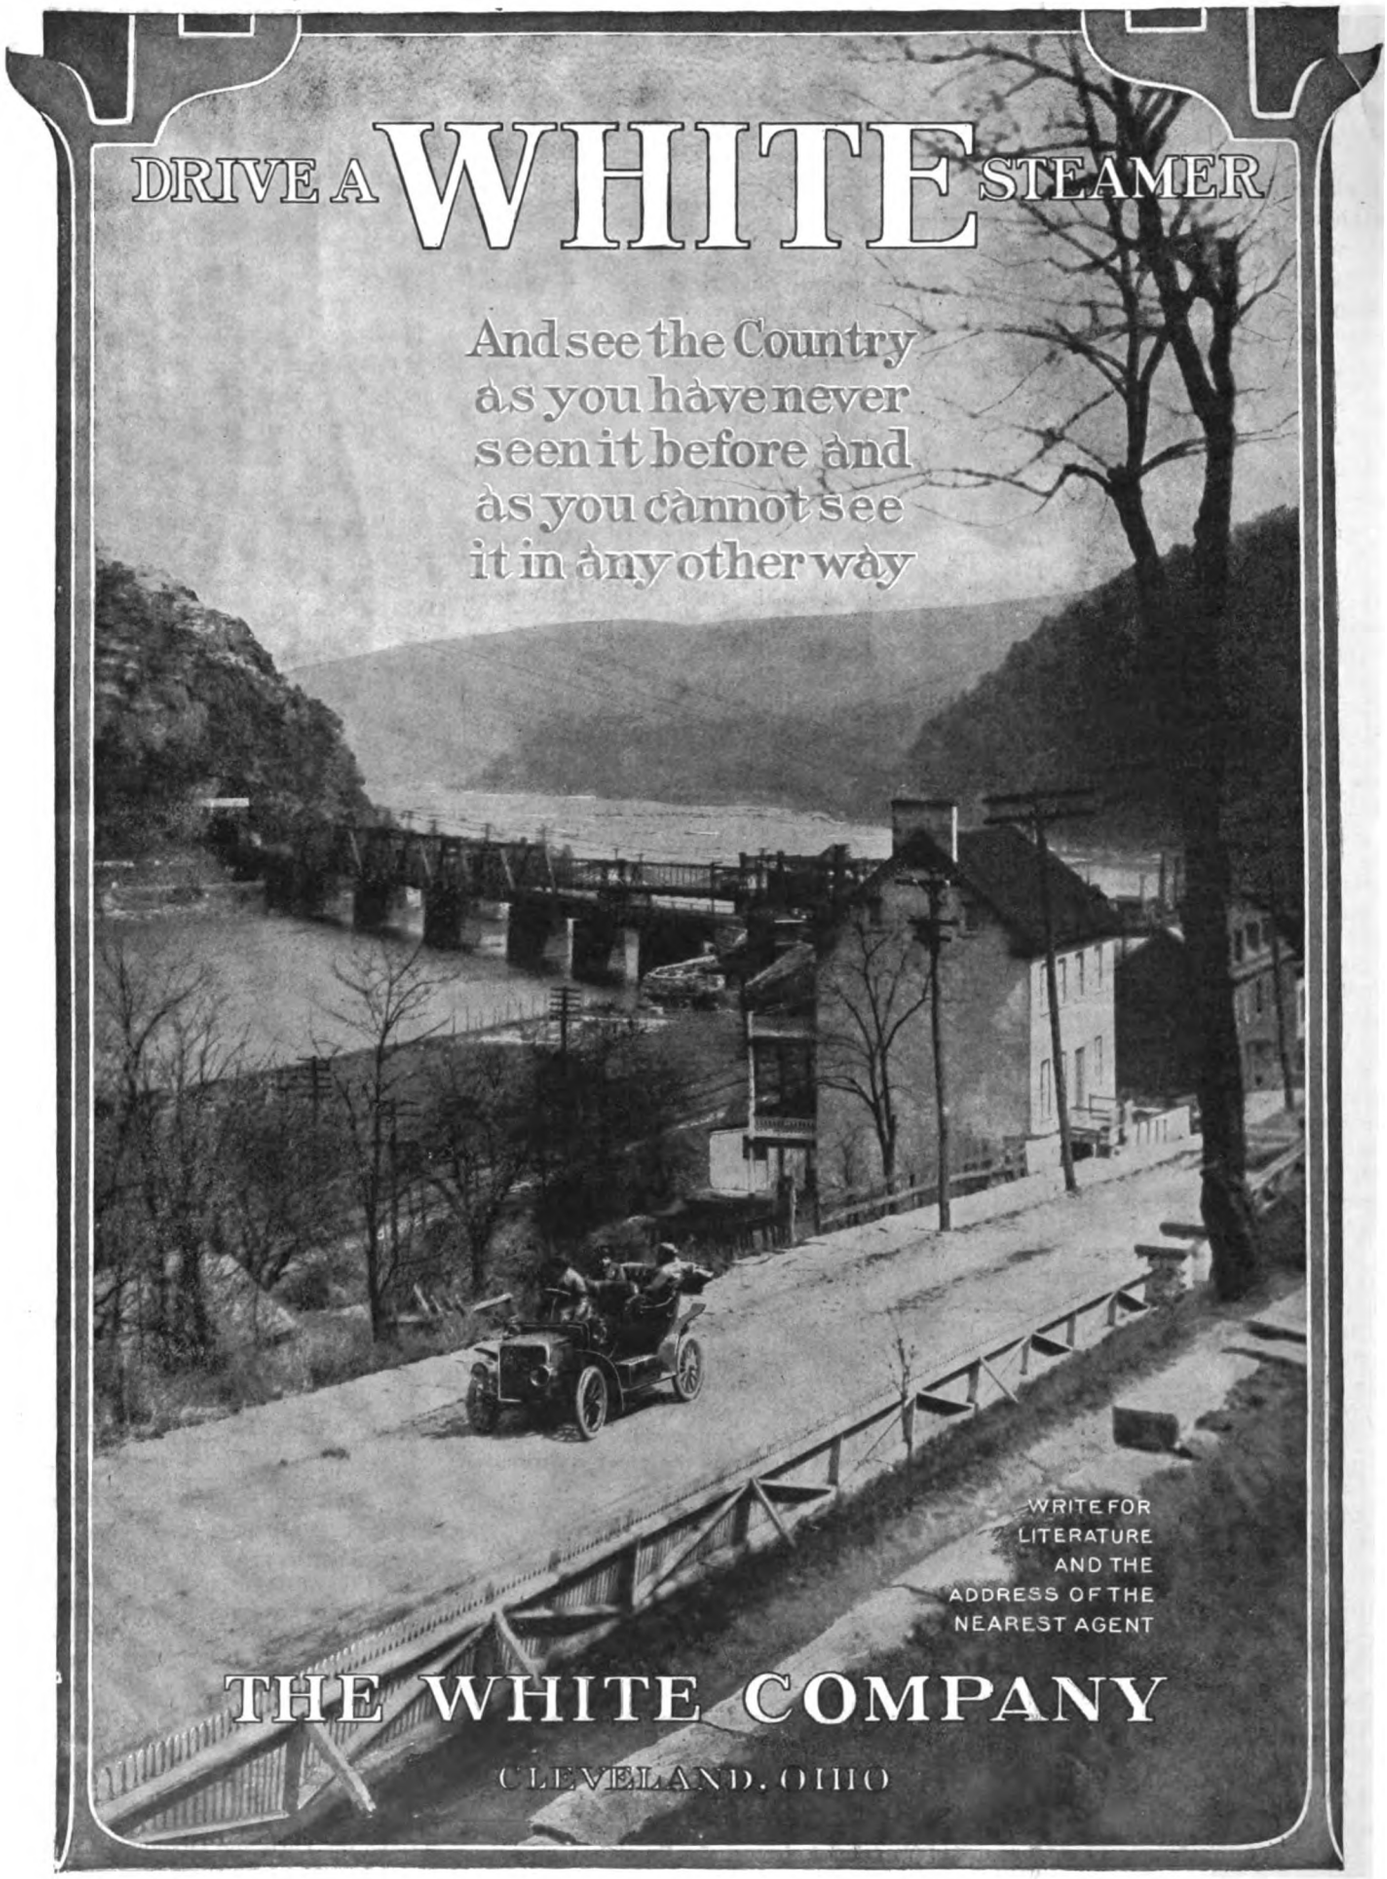
Further steps toward the reorganization of the Pope Mfg. Co. have been taken to the extent that an order has been obtained from the court calling upon holders of the capital stock and holders of the voting trust certificates to show cause why the offer and plan of the reorganization committee should not be accepted. The hearing has been set for Tuesday, November 10, before a court at Chancery Chambers, in Newark, N. J.

Of the first and second preferred stock, the holders of which will alone participate in the exchange of new shares, there has already been deposited with the trustees over 98 per cent. of the first preferred, and approximately 90 per cent. of the second preferred. The stockholders themselves have subscribed for a large part of the issue of $800,000 in notes which is to provide the ready cash for launching the reorganized company, the balance being taken by the underwriters for marketing when the deal is effected.

So imminent is the reorganization that the creditors' committee is not pressing the receivers for the fourth and final creditors' dividend which many of the individual creditors are asking for. Since the plan for the new company provides for the payment of all the old claims with interest, the committee has thought it best to await this result, which seems likely of early consummation.

Excelsior to Distribute Stepneys.

Middle west distribution of Stepney wheels and other products of the Spare Motor Wheel of America, Ltd., has been placed with the Excelsior Supply Co., of Chicago, Ill. The former company's retail store at 236 Michigan avenue will be given up, and George S. Morrow, general sales manager, in addition to handling the advertising, will divide his time between New York City, Chicago and Kansas City, at which points the three main distributing agencies are located.



Whitlock Resigns from Empire.

W. G. Whitlock has resigned from the sales department of the Empire Automobile Tire Co., of Trenton, N. J. He went with the Empire company when President C. H. Semple carried with him a number of associates then connected with the G & J Tire Co.

Grossman Sails Next Week.

Emil Grossman, president of the National Sales Corporation, of New York City, sails for Europe next week. He will attend the Paris and Olympia shows.

Concerning the Cup and the Car.

That an American car should win the Vanderbilt cup race against foreign built contenders is a very happy circumstance in itself, but peculiarly so just now in view of the fact that in future the race is to be for American cars only. In lifting the cup, the Locomobile removed all possibility of the taunting comment that not until all foreign cars had been eliminated by the rules could an American contestant capture the trophy. As a conspicuous figure in Vanderbilt races of the past, moreover, its present victory is a logical as well as a gratifying one.

But aside from these causes for self-congratulation, the true American must feel a sense of wholesome pride at the showing made by the other American entries. While the foreign contingent was lacking in the names of drivers famous for their big successes, the cars both in power and in rank in the racing world, were sufficiently representative to make the contest truly international in character. It completely vindicated the old assertion that the American makers are competent to build racing cars as reliable and as fast as any produced in other lands.

Strangely enough the Locomobile that won the race was in no small degree responsible for the row between the American Automobile Association and the Automobile Club of America, which resulted in the Vanderbilt Cup contest event being put under the ban so far as foreign entries were concerned. In framing the rules for the affair the A. A. A. was anxious to make it possible for both the big Locomobile and the large Thomas racing car to compete, which necessitated larger limits than those permitted by the regulations of the so-called Association of Recognized Automobile Clubs abroad. The A. C. A. seized on this omission to observe the rules agreed upon across the water, as the basis of its fight, and the A. A. A. was drawn into a very unpleasant squabble through its desire to give these two cars, on which the makers had spent no inconsiderable sums, a fair chance in competition. It is also significant that both the Locomobile cars were built for the last Vanderbilt contest two years ago, when one of them made the fastest lap in the race, and was crowded out of a place at the finish chiefly because of the lack of demountable rims—a handicap which gave tremendous advantage to the foreign contenders.

With regard to the general management of the contest, full measure of credit is due to the members of the Cup Commission and the officials of the Long Island Motor Parkway for what was admittedly first class handling of the affair. At the same time, it is to be hoped that the incidents which caused the summary stoppage of the race at the very moment of the climax through laxity in handling the crowd, will never have repetition. Despite the repeated assertion that no outsiders were to be admitted within the Parkway enclosure, the course was overrun during the entire contest. Local deputies, as usual, proved pitifully insufficient for the tasks assigned them, and that important item, the guarding of the course, was distinctly a failure. Military guards, perhaps, and certainly more rigid discipline among civilian employes must be developed before contests of this sort can become really safe either to witness or to compete in. Of the Parkway itself, no criticism can be offered. The road construction proved satisfactory, and the banking and grades failed to develop the treacherous tendencies predicted.

Legal Sanction for Injustice.

While it may be presumptive for the lay mind to question the rectitude of any approved legal decision, especially when handed down with the unanimous assent of a tribunal so high as the Supreme Bench of the State of Massachusetts, yet the adverse opinion rendered last week in the case of the Ashfield motorist who had appealed from a fine imposed for driving over a "posted" road in his own town, is, to say the least, difficult to assimilate. In a word, the opinion that selectmen, aldermen and others having direct control over country or urban highways are properly and legally empowered to close such thoroughfares to automobile traffic, means that the motorist living on such a street will be unable to bring his car to his own door, or supposing it to be on his own property, to remove it, unless an unposted back street happens to be within reach. It means that an unwholesome degree of authority is placed in the hands of those not always equipped to wield it wisely, that purely local governments are given the power to discriminate between one class of public traffic and another and that their decision in such matters is final.

Few test issues of recent adjudication have had as important bearing upon the rights and privileges of the motorist as this. The possible effect of thus establishing a right of segregation between self-propelled and other means of traffic is self-apparent. It is the same principle which has been thrashed out over and over again in connection with the enactment of automobile laws, good, bad and indifferent. The motorist on the one hand, struggling for recognition as a rightful user of the public thoroughfare; the anti-motoring element on the other, striving in opposition merely because of an ancient prejudice or the detractory influence of the minority of wild and hysterical motorists whose influence ever has been the worst possible enemy to the cause. Mark the automobile as a vehicle of transportation equal in principle and right with any other vehicle capable of following the highway, and its abuse is at once reduced to its proper level, that of an offense against the precepts of decency—in other words, a plain breach of the peace. Define it as a thing apart, subject to special restrictions and open to objections based on superficial

Digitized by Google

or whimsical analyses, and its status must remain subject to special privilege, and special restriction.

The justice of the finding that a legislature which has the accepted right to restrict the speed of automobiles also has the right to limit their use in other respects, is beyond question. That it also may delegate to other and lesser bodies certain of its powers in this respect is a conclusion undeniably justified. The failure of this attack upon the constitutionality of the practice of allocating such powers either to state or local bodies, however, is of far more than local significance. The special provision to which it accedes might be of considerable importance and utility at times and under certain extraordinary circumstances. But its indiscriminate use is to be deplored and even feared. It is greatly to be hoped that the door thus set open will not provide ingress for a growing restraint upon the legitimate motorist which in some localities already has gone hopelessly beyond its reasonable limits.

Fortifying the Brakes.

In the concerted movement for the improvement of braking efficiency which has been in progress for the last year or two it is rather surprising to note that designers almost without exception have overlooked one rather important point, and that in the more modern braking systems a useful feature which was perhaps accidental to their predecessors has been overlooked. Despite the advantages of equalizing the application of the bands upon opposite driving wheels, it is noteworthy that with most such contrivances the breaking down of one side of the system involves the disablement of the other. While the probability of accident through the breakage of one of the shoes is not very great, especially where two full sets of brakes are employed, still the very fact that the average driver regards his brakes as being absolute duplicates, is sufficient evidence that both should be made as reliable as possible. For should one set become disabled the full burden falls upon the other end in the absence of proper devices to prevent it, the yield of one of these brakes would mean entire loss of control.

The usual method of brake compensation by means of a balance beam is useful only to the extent of equalizing the power applied to the bands. Beyond this, differences in the adjustments of the two brakes, or differences in the condition of the working surfaces, involve an unequal application of the retarding force. On this account it was at one time proposed to apply a different method of equalization by placing the differentiating medium between the two anchor points rather than between the two points of application. Aside from its inherent advantages in other respects, such an arrangement would be of service in providing against the entire cutting adrift of one brake when the other gives way.

With the ordinary method of application it is difficult to devise means of providing against this contingency. Indeed the only really effective method would be to arrange stops for limiting the movement of the arms of the equalizer, placing them in such a position that they would not interfere with its movement so long as the two brakes were evenly applied. In the event of a failure on one side, with such an arrangement, the stop on the disabled side would become a fulcrum point about which the beam would swing in applying the other. A little longer travel for the lever or pedal would be required in this case, but to an amount which could be provided for readily enough. It may be that in some of the many arrangements now in use this principle is developed, accidentally or otherwise, but so far as is known such is not the case. At all events no such feature ever has been brought out as a talking point.

COMING EVENTS

October 31, Philadelphia, Pa.—Automobile Club of Philadelphia's sixth annual tour for the Brazier Cup.

November 2, St. Louis, Mo.—Manufacturers & Dealers Association hill climb, Solomon's hill.

November 3, Hartford, Conn.—Hartford Automobile Club's 24 hours race.

November 7-8, New Orleans, La.—Two days' race meet.

October 31, Dayton, O.—Race meet, State fair grounds.

November 25, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

November 27, Denver, Col.—Colorado Industrial Exposition Association's race meet. Overland Park track.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show in Madison Square Garden.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

February 6-15, Chicago, Ill.—National Association of Automobile Manufacturers, Coliseum and First Regiment Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

To Race for Brazier Cup October 31.

Philadelphia, Pa., is having its full share of motoring events this fall, the next in line being the sixth annual run of the Automobile Club of Philadelphia for the Brazier Cup, which is scheduled for Saturday, October 31. The affair is to be run strictly within the speed limits of the various boroughs and townships through which it passes and contestants will be obliged to adhere to the time schedule mapped out. The course is roughly, a rectangle, starting at Broad and Walnut streets and running west through Lansdowne, Aldan, Swathmore, Wallingford and Media, then north through Devon and Valley Forge; switching eastward to Bridgeport, Norristown and Ambler, thence back to the Quaker City, via Chestnut Hill and Germantown. The distance will be approximately 65 miles.

New Rules Reduce Size and Weight.

Announcement was cabled from Paris last week of the new rules in the matter of racing limitations for 1909, made by the International Congress of Recognized Automobile Clubs. The change has to do with the reduction of the size of cylinder bore and weight of the car and was recommended some time ago by the Italian Club and endorsed by other foreign clubs.

The new rules provide for a maximum bore of 130 mms. or 5 1-10 inches, and a minimum weight of 900 kilos, or 1,984 pounds. This cuts down the size of four cylinder racing motors one inch, and the minimum weight some 600 pounds.

Fort George Hill Climb Off Again.

Because of an objection on the ground that it might interfere with the prerogatives of voters, the much-postponed Fort George hill climb which the New York Trade Association has been endeavoring to promote, has again been set over. After all arrangements had been made for the contest and entries invited, John T. Dooling, president of the State Board of Elections, called the attention of Mayor McClellan to the fact that the competing cars would pass one of the polling booths, and that no little confusion might be expected to result in consequence. The immediate result was the abandonment of the date.

LYTLE AND ROBERTSON POSE

ROBERTSON FINISHES WHILE IRISH VOLUNTEERS HOLD BACK THE CROWD

Cynical and superficial as the sharp-tongued old gentleman may have been in declaring that the Vanderbilt cup race is chiefly valuable in "giving half of New York an excuse to sit up all night," yet he hit upon one of its most striking phenomena for his commentary, but one which properly interpreted signifies the astounding degree of popular interest in the event, which has taken the character of a settled institution. Variously estimated at from 200,000 to 500,000 people, the crowd which saw the fourth race for the Vanderbilt cup, on Saturday, the 24th inst., got a full reward for all losses of sleep and expenditures of money, in a sporting contest that was rich with the qualities of speed, picturesqueness, and keen competition, and which resulted in a brilliant victory for an American car.

Driving a sharp, decisive race, in his 90 horsepower Locomobile, George Robertson secured a signal victory over Herbert Lytle, winner of the Long Island Sweepstakes of two weeks before, who drove an Isotta car with even greater steadiness, though less brilliancy. Robertson made the fastest lap times in all but the fourth, fifth and sixth laps, in addition to which he made the fastest lap in the race. Lytle, on the other hand, held either second or third place for the entire contest and handled his car with a precision which was remarkable.

The Locomobile figured as No. 16, and was the thirteenth to get away from the

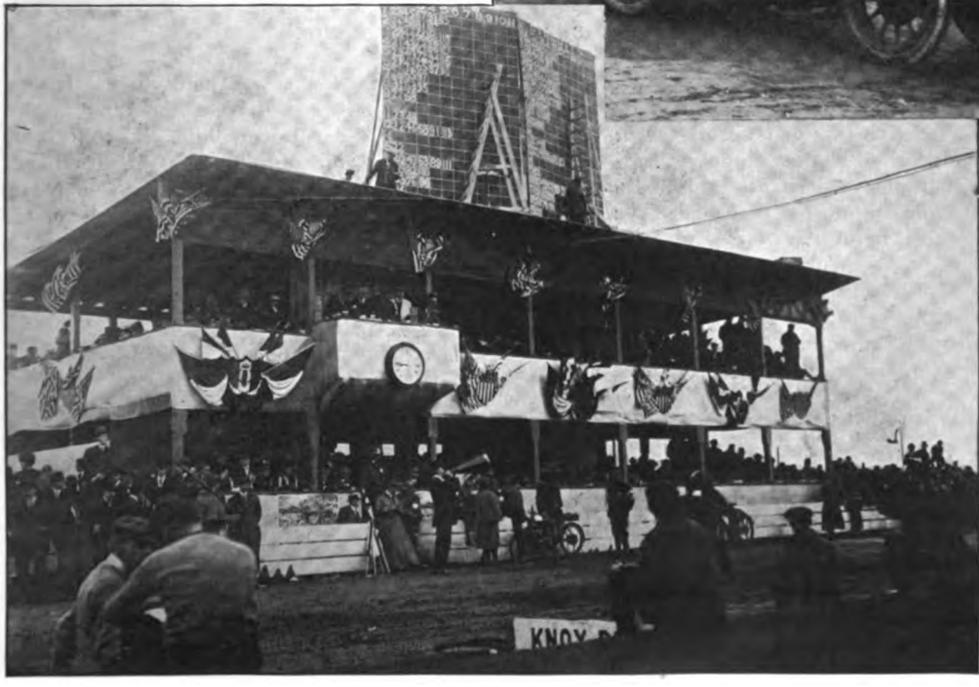
LYTLE, ISOTTA, STARTING

line. Lytle's car was No. 6, so that he finished first. The 8 minutes, 11⅘ seconds which elapsed after the end of Lytle's race and before Robertson finished, were fraught with the most intense excitement—especially at the grandstand, where it was known that the outcome of the contest depended on the performance of the Bridgeport car during those last precious moments.

Early in that same lap, a wild skid had delayed Robertson by 2 minutes or more at Plainview, while he replaced a tire, and rumor had been busy building all sorts of thrilling and time-exhausting accidents about a very bare substance of known fact. When at length he came flying down the long stretch to the finishing line, therefore, the enthusiasm of the crowd knew no bounds. For a brief space the fate of what amounted to an international race had hung in the balance, and the relief of the American victory and the Italian defeat caused an overflow of the stands and the course which swept the awkward military guard completely off its feet, swamped the constabulary and threatened the following racers with the awful fate which has marred the conclusion of each previous contest for the Vanderbilt Cup.



Not only at the grandstand, but at all points on the course, the people surged excitedly into the path which the cars were

STRANG'S RENAULT BALKS

following. That no fatalities occurred was a marvel. Such an inrush of foolhardy humanity could not fail to result in accident, however, and the incident which caused the abrupt termination of the race was a direct effect of inefficient safeguarding of the course.

The second car behind the winning Locomobile arrived just at a moment when the course was completely flooded with the overflow from both sides of the way. Oddly enough it was the other Locomobile entry with Florida at the wheel. A touring car had backed on to the course from one side, and was smothered in the crowd. An opening was made for the racing car as it bore down, but too late to give it ample room. A collision between the two machines occurred and in the confusion a youth was knocked down and sustained a broken leg. Immediately afterward Referee Van-

Digitized by Google

derbilt ordered the race stopped, and Luttgen, driving Vanderbilt's own car, together with Salzman in the Thomas, were accorded third and fourth places by virtue of their existing positions in the race.

When in a race of 258 miles the first and second positions at the finish are separated by only 1 minute and 48⅕ seconds, as was the case between Robertson's Locomobile and Lytle's Isotta, it is evidence that drivers, owners and spectators had plenty of thrills as the fortunes of the different cars varied. Robertson made the 11 laps in 4 hours and 48⅕ seconds, at an average rate of 64.3 miles per hour, while Lytle covered the distance in 4 hours, 2 minutes, 36⅗ seconds. Neither in the fastest lap of the race nor in the average for the whole distance, however, did the winner equal the best records of previous Vanderbilt races. In 1904 the Panhard, driven by Heath, made its fastest lap at 70.9 miles, while Robertson's fastest lap was at 69.49, and in 1906 Wagner covered 297.1 miles at an average rate for the whole race of 65.13 miles per hour. Weather conditions accounted in no small degree for the fact that records were not broken, as the leaders drove to the limit of what the wet and slippery course would stand.

Of the seventeen actual starters, eleven were of American manufacture and six of foreign make. At least three of the latter were entered by individual owners desiring to contribute to the success of the event, while the others had trade backing. The list was very representative, including besides the American entrants, the products of Germany, France and Italy. Two of the three Mercedes dropped out, as did the Hotchkiss and the Renault, so that the foreign showing exhibited no superiority to that of the American entrants, as out of eleven of the latter, seven were running when the race was called off.

HOW THE GREAT RACE WAS RUN AND WON

REFEREE VANDERBILT, CHAIRMAN THOMPSON AND ROBERTSON IN CONFERENCE

Because of the rain and heavy grayness of the morning the start was set for 6:30, as it would have been hard to determine the "day break" which was to have marked the beginning of the race. Most of the cars began to arrive from their quarters early, booming along the course in irregular cannonades and sputts of fire from their exhaust. To make way for them the sleepy and otherwise uncertainly gaited Irish volunteers, with light blue overcoats and muskets, were set to work pushing the people off the roadway, and after considerable activity and the punching of a few offenders with gun butts the crowd was compressed sufficiently to the sides to leave the space at the line fairly clear.

As the time approached, Starter Wagner lined the machines up in numerical sequence, with Florida's No. 1 Locomobile on the tape. For each car, Wagner marked off the last ten seconds by calling them out with an accompanying movement of the hand, and with the final word "Go!" giving the driver a slap and a shove on the shoulder When Florida shot away he was given a hearty cheer, and he went spinning up the stretch into the distance as the first to take chances with the slippery and uncertain conditions which the rain had developed. At one minute intervals thereafter, the successive numbers were sent off, generally with a momentary whirling of the rear wheels which sent out a shower of sparks as the steel studs of the non-skid tires ground the cement. The first break in the regular order came after the No. 9 Hotchkiss had been started, as the No. 10 Brasier, entered by Harry Payne Whitney, did not appear. Word came that its steering gear had been broken on the way to the course and that it would not start. To keep the calculations easy, the No. 11 Acme, which came next, was held two minutes, for the starting time originally assigned to it. The No. 12 Thomas followed one minute after.

In deference to superstition, No. 13 had not been assigned to any car, and No. 14, the B. L. M., had been withdrawn, so that No. 15, Matheson, was held three minutes after its predecessor, that the tally might be simple. The Locomobile, No. 16, driven by Robertson, was due one minute thereafter, and as it came up to the line there was a sustained cheer for the favorite. Oddly enough, Robertson was the thirteenth starter, but subsequent events proved that whatever hoodoo resided in this circumstance was very trifling. Robertson got away in splendid style and the crowd turned its attention to Strang, who was the pilot of the No. 17 Renault, which was to follow. Strang hardly got to the line before his engine stopped, and as Wagner began counting the seconds there were desperate efforts to start it again, but without avail. While three excited Renault handlers tugged at the crank Strang sat patiently waiting for the engine to take up its thundering. When the ten seconds had been counted off and "Wag" had given his concluding slap, Strang futilely juggled with a side lever, but the car was ridiculously inert and silent. Furthermore, there was no one at the crank

VIEW OF GRANDSTAND AT FINISH—CROWD SURGING OVER THE COURSE

at the moment and the driver looked much alone and helpless. The machine was finally pushed over the starting line, and after some more tugging at the crank it was pushed back to the Renault supply pit where it remained, while Strang and his mechanic fumed and fussed over it for half an hour.

Foxhall Keene, with his No. 18, Mercedes, waved his compliments to his friends in the boxes and was rewarded with a demonstration of enthusiasm and fluttering handkerchiefs from that quarter. His engine was missing badly when he began his race, however, and his penchant for smashing telegraph poles and for misadventure generally made it a practical certainty that he would not finish. Another amateur, described as a young Baltimore millionaire, appeared in the person of Gill, the driver of No. 19, Thomas, but he attracted little attention as a probable winner. The Knox, No. 20, concluded the list of 17 starters, and when it was out of sight, all eyes were turned to the west to watch for the first car around.

In about four minutes the cry of "Car coming!" arose, and a lively speck was seen to skip over the rise of the distant bridge and skim down the curves into the straightaway stretch leading past the grandstand. As it entered the stretch and came head on, it grew with astonishing rapidity and showed a radiator front and wheels. A vertical white streak down the center of the swaying radiator proclaimed it Florida's No. 1 Locomobile, and the car went sweeping by at a speed that brought a howl of delight from the spectators. Another car was soon sighted, closely followed by still a third, and as they came flying toward the finish of their first lap they proved to be the No. 3 Mercedes, driven by Stricker, and the No. 4 Chadwick, piloted by Haupt, both of which had passed the No. 2 Knox, with Denison at the wheel. The Knox was next, however, and while it was going at no mean speed, it was rapidly overtaken by Lytle in the No. 6 Isotta, which flashed by the stand in pursuit.

Following these five cars, came William K. Vanderbilt, Jr.'s Mercedes, the No. 5, driven by Luttgen, which had been passed by the Isotta. Then a string loomed in sight, consisting of Kilpatrick's No. 9 Hotchkiss, Ryall's No. 7 Matheson, Salzman's No. 12 Thomas, and Patschke's No. 11 Acme.

When Robertson in the No. 16 Locomobile appeared, there was great excitement, as it was evident that he had come around faster than any of the other cars, but the cheering which that fact was about to elicit when he should go by, was suddenly changed to groans of concern when his mechanic was seen to wave to the supply men in the pits as the machine neared the stand and Robertson jammed on the brakes and came to a stop after crossing the line. He called for water and the radiator cap was quickly removed and a funnel inserted, into which a pail of water was promptly poured. The pail emptied, the funnel was thrown aside and the hose from the water pipe line substituted till the radiator was full, the cap was screwed on again and Robertson was off before two minutes had elapsed. The postponed cheer broke out spontaneously as he got away, and was followed by a big demonstration when it was announced that his first lap had been made in 20:54, faster than either Lytle's Isotta or Haupt's Chadwick, which had made the round in 21:52 and 21:53, respectively. It was feared by the crowd, however, that Robertson's stop for water had indicated a leaking radiator, until it was remembered that the car's engine had run steadily for over ten minutes while the machine was waiting behind the starting line, and had probably boiled away quite a bit of the radiator water at that time, due to a lack of wind pressure

Rambler ~1909

Five Models, $1,150 to $2,500

Model Forty-four,
34 H. P. Price, $2,250

THE offset crankshaft, straight-line drive, safety starting device, large brakes, big wheels and tires — these features were the vital factors in the Rambler success of the season just past. Its performance in the hands of every Rambler owner has surely confirmed this. These features increase the power, flexibility, and efficiency, assure safety, enhance the appearance of the car, improve the riding qualities, provide unusual clearance, and minimize tire trouble and expense

Model Forty-Four Roadster, Four-Cylinder,
34 H. P. Price, $2,250

Specifications—Model Forty-four Touring Car and Roadster

Wheel Base—Touring, 112"; Roadster, 110". **Wheels**—36".
Rims—Midgley Universal.
Tires—36 x 4 Goodrich Quick Detachable; options Hartford-Dunlop, Diamond, G & J, and Fisk clincher.
Springs—Front, semi-elliptic; rear, triple action, 52 inches long.
Engine—Four vertical cylinders.
Valves—Overhanging, all on one side.
Crank Case—One piece, side opening.
Ignition—Jump spark; storage battery. Bosch magneto, $150 extra.
Transmission—Selective type, adjustable roller bearings.
Drive—Shaft, straight line.
Brakes—Two, on rear hubs; 400 square inches surface.
Body—Touring, five passengers; Roadster, three or four passengers.
Equipment—Two lens mirror head lights, two square side lamps, and tail light, generator, or uncharged gas tank, horn, tools, etc.

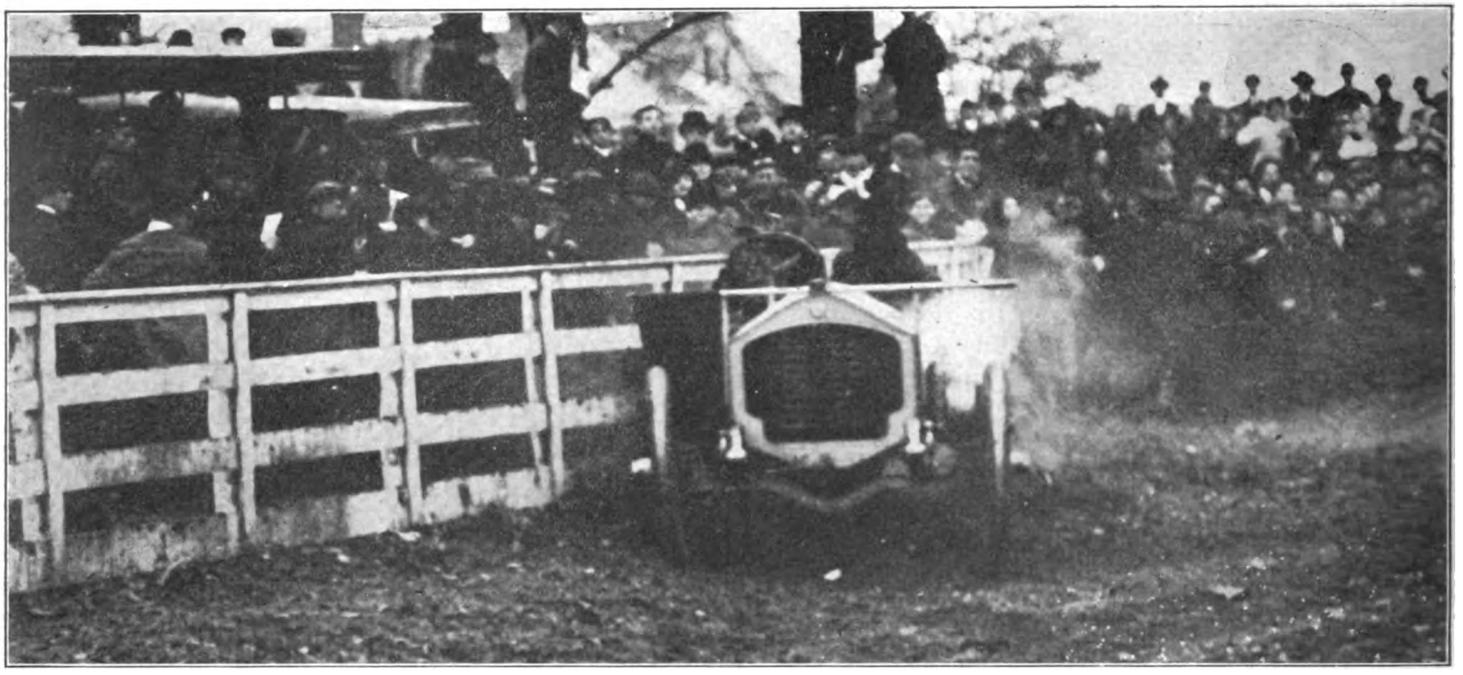
Model Forty-five, Four-Cylinder,
45 H. P. Price, $2,500

—in addition to certain refinements for the owner's comfort and convenience, the new Rambler features for 1909 include the Rambler spare wheel with inflated tire (extra charge), triple action springs, adjustable steering column, provision for magneto, convenient brake adjustment, and adjustable clutch spring. One high-power, seven-passenger model as illustrated above, with 123-inch wheel base and tire size 36 x 4½ inches, will be added to the Rambler line for 1909. Other details of this model similar to Model Fourty-four.

Model Forty-one, Two-Cylinder,
22 H. P. Price, $1,350



Specifications—Model Forty-one

Body—Detachable tonneau; capacity, five or two passengers.
Wheel Base—106". **Wheels and Tires**—34 x 4".
Motor—Double opposed, entirely enclosed, with transmission gear, making unit power plant.
Power—22 H. P. **Cooling**—Water, thermo-syphon system.
Lubrication—Mechanical force-feed oiler.
Ignition—Jump spark, current from six volts, sixty ampere storage battery.
Transmission—Planetary, two speeds forward, and reverse.
Clutch—Multiple disc.
Equipment—Two gas head lights with large separate generator, oil side and tail lights, exhaust signal, pump, tools, and tire kit.
Price—$1,350 with tonneau, $1,250 without tonneau, and with torpedo deck.
Torpedo Deck extra—$25. **Top extra**—$75.

Model Forty-seven, Two-Cylinder Runabout, 22 H. P. Price, $1,150 and $1.200

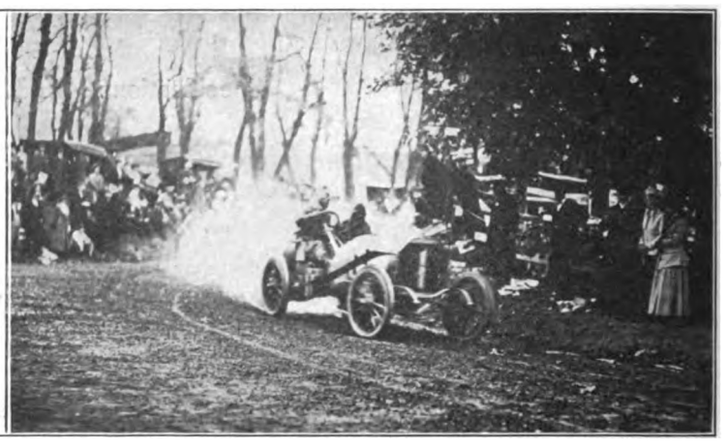
WHERE PATSCHKE HIT THE FENCE AFTER ROUNDING SHARP TURN AT WESTBURY

through the interstices of the cooler as the car stood still. A very light radiator of special design had been fitted for the race, in order that the car might weigh in despite the extra weight of its quickly demountable tire rims. The new radiator had a more limited water capacity than the regular style.



While Robertson was taking water, the Matheson No. 15, driven by Chevrolet, had passed, and the Locomobile had just got under way again when Seymour's No. 8 Thomas and Gill's No. 19 Thomas put in an appearance, trailed shortly after by Bourque in the No. 20 Knox, which accounted for the whole list, except Keene, while Strang was still wrestling with his Renault at the starting line.

Florida was first over the line in the second lap, but had Stricker's Mercedes and Haupt's Chadwick right at his heels, the two passing the grandstand together, followed at intervals by the others. Chevrolet's No. 15 Matheson retired with a cracked cylinder gasket and Gill's No. 19 Thomas burned out its clutch. Word came that Keene had had a fire, but that he was on his way again. Strang was somewhere on his first round, having started after a delay of half an hour. Fifteen were thus still in the race, but the times showed that Haupt's Chadwick, Lytle's Isotta, and Robertson's Locomobile were the three fastest cars, with Florida's Locomobile, Salzman's Thomas, Stricker's Mercedes, and Patschke's Acme all putting up a splendid race. The Acme had had a very narrow escape in the first round when it had skidded at Westbury. The turn at that point is very sharp and Patschke took it at a furious pace. His car skidded for over 100 feet, the right rear wheel striking a substantial fence. The hub went between the horizontal bars, but the impact of the tire against the boards ended the skid and Patschke headed straight out for the road again and was off before the frightened crowd could catch its breath. Quickly as the whole circumstance took place, however, it gave time for an enterprising photographer of the New York Tribune staff, Henry Steffen, to take one of those rare pictures which crystalizes the excitement of such a moment and shows what really happened. The picture is reproduced herewith, and indicates what a close call both Patschke and the crowd had.

Before the third lap was completed by the leaders, both Strang and Keene had got around for the first time, but it was evident that they had no chance of winning. Strang's car bobbed around like a cork, and Keene's was limping with a very irregular exhaust from its smoked-up bonnet which had suffered from the fire, as had Keene's moustache and eyebrows. Florida again jumped into view with the others at his back at the finish of the third, but stopped at the pits for a change of a right rear tire,

STRICKER'S MERCEDES IN A LIVELY SKID

ROBERTSON GOING "GREAT GUNS" ON STRAIGHT STRETCH

while the No. 4 Chadwick and the No. 3 Mercedes went dashing by. Robertson soon came tearing along like a whirlwind, completing the lap in 20:17, which proved the fastest time of the day, being at the rate of 69.3 miles per hour. Nor had the Chadwick and the Isotta stopped to pick flowers by the wayside, and most of the other cars were running regularly and well, with the exception of the Acme and the Hotchkiss, both of which retired at Central Park, the former with a broken cam shaft and the latter with a seized connecting rod bearing, which broke the connecting rod and plunged it through the crank case.

The fourth round gave the Chadwick the lead in point of elapsed time, with the Isotta second, Stricker's No. 3 Mercedes third, and Robertson's Locomobile fourth. It was Robertson's slowest lap, his time being 25:50, which left him 3 minutes and 4 seconds behind the leader. Strang retired from the race at about this time, and gave vent to his feelings by coming around to the grandstand and indulging in numerous cigarettes and some verbal wails about his hard luck. He attracted considerable attention until Ryall drove up, his Matheson bursting into flames as he stopped. Ryall usually arranges to break a leg and a collar bone when he is participating in a big race, but on this occasion found that a burning car will create quite as much commotion. While women screamed and men looked scared, some sensible person grabbed a fire extinguisher from the front of the stand and promptly put out the conflagration. When the temperature had cooled down to a point where he could work on the machine, Ryall attempted to repair the damage and get started again, but he was not able to make a go of it.

With six cars out of it, the fifth lap had eleven contestants for a while, but Keene's Mercedes needed a fire brigade so often that he finally had to withdraw. Again Haupt's Chadwick was the leader in the elapsed time, with Stricker's Mercedes second, Lytle's Isotta third and Robertson's Locomobile fourth. These four were rapidly leaving the other six cars, of which latter Salzman's No. 12 Thomas was the leader, with Florida's Locomobile and Luttgen's No. 5 Mercedes following on even terms. The two Knox cars were running well, but their comparatively low power put them at a disadvantage in speed, while Seymour's No. 8 Thomas was trailing leisurely.

In the sixth lap Robertson set out to gain the lead. He slammed ahead in the most reckless fashion, cavorting around the turns with terrifying skids and opening up to the limit on the straight stretches. So wild were some of his skids that he was slowed down considerably in recovering, but as it was he made the round in 20:30, at an average rate of 68.6 miles per hour. Crossing the last bridge on the way to the

ROBERTSON'S LOCOMOBILE JUMPS THE BRIDGE AT WESTBURY (Copyright, R. Tebbs)

Digitized by Google

grandstand and coming down the decline into the S turn to the stretch, his car slung completely crosswise of the parkway, and it was only by marvelous dexterity with the steering wheel that he saved himself from plunging into the deep side ditch. He had previously taken a bridge rise side by side with Salzman's Thomas, the two cars banging hubs while at the highest point and both plunging down the descent in such close proximity as to give the appearance of almost certain smash-up. But the Locomobile came through safely, and at the end of the lap Robertson had overcome the lead of both Lytle and Stricker and was second only to Haupt in the Chadwick.

Ignition trouble afflicted the Chadwick in the seventh round, and it was only after considerable delay that parts from its two magnetos were combined to form a new one that would work successfully. The delay cost the car its lead, which it had to yield to Robertson's Locomobile. Lytle and Stricker were second and third, in elapsed time, with Salzman next, Florida fifth, Luttgen's No. 5 Mercedes sixth, and the Chadwick seventh.

Further trouble came to the Chadwick in the eighth round, when its right drive chain broke. A roadside repair was necessary. Although all hope of victory had gone glimmering with this mishap, Haupt and his mechanic gamely hurried the work and started going again as soon as they could, leaving fragments of a battered chain case lying by the roadside. Meanwhile Robertson reeled off another round in 20:36, duplicating his time of the seventh lap. Lytle's time was 21:56, while Stricker, in third position, took only 21:27 for the distance. In the next fastest bunch, Luttgen's Mercedes took the lead over Florida's Locomobile by doing the lap in 22:07 as against Florida's 25:59, while Salzman's Thomas dropped back.

Lytle gained slightly in the ninth lap, reducing Robertson's lead to less than three minutes. Stricker in his Mercedes was only about two minutes behind Lytle, figuring elapsed time, while Luttgen's Mercedes was fourth.

The tenth lap tempted Robertson to cut loose again, so that he made the circuit in 20:55, giving him a lead of 4 minutes and 10 seconds on Lytle. The pace was so fast that Stricker's car took fire, necessitating his dropping out after a magnificent exhibition of driving. This moved Luttgen up to third place, and Salzman held fourth position against Florida.

Everybody around the course knew when the eleventh lap commenced that the battle for first honors lay between Lytle and Robertson. Having started ten minutes before Robertson's Locomobile, the Isotta was the first to finish. If Robertson reached the tape inside the ten minutes thereafter, he was the winner. Lytle was finishing when word came that Robertson was off the course. His four minute advantage was being rapidly eaten up by the passing seconds, and the Locomobile rooters in the grandstand were consumed with anxiety to know what had happened to him and whether he was going to be able to finish. After about two minutes, however, the telephone brought information that he was back on the course again, after a tire replacement, headed at full speed for the grandstand. Watches were in almost every hand and eyes were fixed on the distant rise over the bridge where he would first come into view.

When the flagman on the bridge began waving his red signal that a car was coming, there was almost a hush over the whole vast crowd, and when it really proved to be the No. 16 Locomobile pandemonium broke loose. Restraining themselves until he was actually past, the spectators, knowing him to be the winner crowded on the course in the wake of his car and joined in one mad rush to get near him if possible when he should stop. All thought of the other cars still coming was banished, and the megaphone shoutings and the warning of constables, Irish volunteers and deputy sheriffs could not clear the course again.

Not knowing that the race was actually over, Florida came booming along at a speed which made it impossible for him to slow down in time to avoid crashing into a touring car, which with criminal stupidity

CROWDS OVERFLOWING THE COURSE AT WESTBURY DURING THE RACE

Digitized by Google

had been driven out in front of the grandstand. David Shuh, an 18-year-old Brooklyn boy, was crushed between the two machines as they came together and his leg was broken, while Florida and his mechanic were pitched forward with great force. Luttgen, at speed, arrived soon afterward, but by some mystery made his way through a narrow lane of people that opened for him, without doing more damage than scraping a few shin bones with his hubs. The white danger flags in the hands of the signal men stopped the racers who were still on the course.

In the very last lap, Robinson's car had its most remarkable and exciting experience, which threatened to make him lose the race. While running at top speed on the dirt road near Plainview, at a point where most of the drivers shut off to slow for an abrupt curve, but where he did not slacken, the Locomobile skidded into the ditch at the turn. Its momentum was such that it swung up into the road again, whirled itself around in almost a complete revolution, like a pinwheel, and headed up the unused extension of the road from which it had come at the turn. During its spin, a tire burst, and when Robertson brought the machine to a stop and found himself off the course on the unused road, he commenced his tire replacement right where he was. Thanks to considerate members of the crowd, the spectators were kept well back, and the job completed in just 2 minutes and 10 seconds.

By the tearing down of the dividing wall on the top floor of the press stand after the Sweepstakes, a great improvement in the view of the course was effected. Similar improvements could be made on the lower floor.

LUTTGEN TAKING IT EASY ON VANDERBILT'S MERCEDES

SCENES DISCLOSED IN THE MISTY DAWN

There in the distance, through the thin, hazy fog, the arc lamps glimmer on the grandstand and the shafts of light from numerous passing touring cars penetrate the pearly mist in an effort to chase it away. Along the course, as far as the eye can discern cars are parked on both sides of the cement path, which has lost its beautious whiteness and is covered with slippery black mud. The cars skid and slithe and slither over it, for the emulsion of slopped oil and rain water mixed with the tracked mud makes bad going.

Two, three, and then four o'clock roll around and the throng increases and seats in the grandstand begin to fill up. In the press stand opposite, the scribes from many cities are browsing around, some attempting to work, others to sleep. The officials, timers, telephone men, scorers and others, snooze around in chairs or commence preparations for real business.

Presently the White opera bus arrives with the club of Philadelphia newspaper men, known as "The Shock-Absorbers," having made the night trip from the Quaker City in good time. Philadelphia, too, it seems, is to get news of the cup race the same week.

The rain lets up for a few moments and then starts to come down again, wetting the sandwiches and candy of the various merchants who cry their wares about the stand. Calico cigars, peanuts, pop-corn, purple lemonade and candy; hot tamales, hot coffee, hot dogs, enshrouded in soggy rolls; red apples, green apples, blue apples and mint chewing gum are all here. Umbrellas also are for sale, the market in this staple fluctuating constantly, according to conditions. Parasols that sell for 35 cents in New York are bringing $1.50 while it rains, the price dropping to 50 cents whenever the showers cease. Salvation Army lassies are likewise on hand with their tambourines, making hay before the sun shines.

The aroma of campfire smoke is wafted along by the breezes. These small blazes grow more and more numerous along the line as greater numbers of cars appear. From the west of the stand come the strains of the cornetist of the American Locomotive Company's parking space. He is playing popular airs to arouse some of the som-

Digitized by Google

nolent ones—some of the tunes being enough to arouse even the dead.

A brilliant light blue and yellow streak appears at the horizon, and presently a moist dawn breaks with its usual silence. The banners and flags decorating the grandstand blow in the breezes. The homoeopathic score board on the roof does not look large enough to hold the complete notation of the eleven laps and it isn't. Seconds in the lap time, which are of vital importance in such a race, are to be disregarded—only the minutes are to be recorded.

A little way down the line a trumpet sounds and then a few musical drum beats. The Irish Volunteers are approaching. Uniformed in blue coats and armed with guns, they march down to the starting tape and receive some confused orders about proceeding to clear the course. In their confusion they are not unlike the comic opera guards of stage tradition. They seem neither militant nor military.

Now they start timidly to clear the way—it is highly amusing. The Volunteers request the crowd to "please" step back and the crowd smiles, but moves not, and tells the soldiers to stop their "kidding." The spectators in the grandstand and the scribes in the opposite stand laugh loud and long. The swaggering colonel rants and blusters around, but the crowd packs solid between the pits and the stand and likewise jams about the official pavilion. The soldier boys make an effort to clear out these places, but they are like so many school children, though less active. What in the world has become of all the Irish fight in them? By degrees they get the rapidly increasing throng to give way slightly, aided by an official touring car, which plunges at the mass and forces it back.

On the second floor of the press stand Mr. H. F. Cuntz has an elaborate graduated graphic scale arranged with numerous straight and fancy curved lines drawn upon it, by which it is possible to determine, by continually making marks and notations, the relative position of each car in the contest, the speed for each lap and the average time for any number of laps up to any point of the race. It is quite an interesting sort of Chinese puzzle; simple, though apparently intricate and is Mr. Cuntz's own invention.

This same press stand, by the way, is occupied quite as much by others as by newspaper men. Advertiseing solicitors, sales managers, agents, tire makers, oil manufacturers, second-hand car dealers, undertakers, shoe clerks and glove salesmen, somehow have contrived to be labeled with "Press" badges. Only yesterday it was highly difficult to obtain sufficient badges for members of the real working staff of papers. However, there seems to be room enough for all and when the doors of the free lunch room open, there is a continuous and typically "newspaper" raid on the viands.

The racing cars are arriving now. Salzman, with his Thomas, is first. George Robertson snorts up and registers an emphatic kick to Starter Wagner and Mr. Vanderbilt, about the way the people are swarming over the course. Salzman and a few other drivers are changing tires, replacing with non-skids.

Nearly all the machines are equipped with studded tires—all wearing Michelins except the two Knoxes, Patschke's Acme, and Florida's Locomobile, the last two being fitted with Diamonds. Nearly all of the drivers and mechanics have their faces equipped with non-skidding, antiseptic masks.

Like many other of the large New York hotels, the Waldorf-Astoria made special preparations for those of its guests and patrons planning to go to the race, and a temporary outdoor garage and repair shop was installed in the Astor court, which ordinarily accommodates only palms, rubber plants, fountains and fresh air. The Palm Room was kept open all night serving early breakfasts. Over 500 special "cup race" hampers were provided for motoring parties. Loaded with roast chicken, drinks, sandwiches, pastry and sweet-meats, and supplied with a complete assortment of Waldorf monogramed knives, forks, speens, plates, cups and saucers, they sold for from $25 to $100 apiece. The St. Regis and the Plaza provided for their Vanderbilt race patronage in much the same way.

Whatever value the wire fences on the Motor Parkway may have in time of peace, they are worthless in keeping the crowd off the course during a big race. Folks just pulled it down, cut through it or climbed over. The concrete road of the Parkway, however, was better than ordinary roads for the drivers, so far as the crowds were concerned. On dirt roads the people crowd to the edges of the black streak down the center that has been oiled, taking it for granted that the cars will keep to that narrow path with the exactitude of tram cars to their rails. But the concrete road is wider, and it is only the most bold and reckless that brave death by standing within its edges.

Next year, perhaps, many of the spectators will bring their own grandstands, as H. J. Silleck did on Saturday. Mr. Silleck had his touring car fitted with a very substantial stand about 14 feet high and large enough to accommodate five or six persons. From this coign of vantage, his family observed all that was going on and were quite comfortable, save when the rain drizzled down into the little white enclosure, mounted over the tonneau, gave them a pitiful semblance to so many people in a shower bath. If others follow this example at future races, the parking space problem may become a difficult one.

At 7:25 a. m. the glorious golden sun came out and settled up in a hazy sky much like a giant, juicy fried egg. The crowd cheered and gave Old Sol considerable applause and the latter smiled blandly, stretched himself and mounted a little higher to get a good view of the race. His rays glistened on the gilt Warner Auto Meter car, with its body shaped into an enormous Auto Meter, that kept tooting its siren as it chugged up and down the road in back of the official stand.

Now that the day had brightened up, the persons of the Smart Set and the Half-Smart Set in the boxes were able to display themselves to better advantage. Standing on a chair occasionally helped a chic figure to show off a new directoire gown in a fetching manner, while a Duchess with a slab of pie in one prettily manicured hand and a chicken sandwich in the other, served to attract occasional gapes of attention. The fact that the stand was so crowded, prevented many grandames from making the sensation they had expected to and a large number missed the expected description of their gowns in the Sunday papers.

When the Chadwick entrant came up to the starting line, Charles W. Mears, advertising manager of the Winton Motor Carriage Co., of Cleveland, displayed unusual enthusiasm. "I hope it wins the race," he declared. Someone reminded him that it was not only an American car, but a six cylinder car, and that it was not so extensively represented throughout the country as to present serious competition with his own company's exclusively six cylinder products. Mears nevertheless persisted in his desire that the Chadwick should win.

After there had been an exciting brush in which one car had passed another at speed, a white moustached motorist turned to his friend and asked, "Did you ever see a 24-hour race on a circular track?" The other replied in the negative. "Well," continued the first speaker, "if you think what we have just seen is exciting, you should watch a 24-hour race some time. It's just like that every minute, and from a spectator's standpoint has this Vanderbilt race business beaten to a pulp. Don't you know, you can see all the cars all the time."

Flash bulletins were sent to Bridgeport, Conn., when the Locomobile won, and the big steam whistles of that factory where it was made was pulled wide open, as a signal of the victory. The newspapers posted the news on their windows and boards, and the town received the information with gratification. Arrangements are being made for a big local celebration in honor of A. L. Riker, the designer of the car, and Robertson the driver.

Some of the afternoon newspapers on the day of the race gave vivid accounts of Starter Wagner flourishing a nickel plated revolver, which he was supposed to fire in starting the contestants. Just plain faking, as a gun could not be heard above the explosions of the big engines.

LIVELY DOINGS AT SUPPLY STATION

Probably at no point on the course did the spectators get more for nothing than at the official supply station on the back stretch midway between Jericho and Woodbury. Here the cars stopped when they wanted gasolene, oil, tires or other things and this was the only place where one could get a look at a real racing automobile at the sight of the cars racing by as fast, perhaps, as on any point of the circuit.

There was no buzz of excitement until after the first seven cars had passed in the numerical order of their starting, and all going well. The eighth car to pass was Seymour's Thomas. It was going along so slowly that some roadside wag was tempted around in his Locomobile. In less than a minute followed Stricker.

Where's the Knox? Where's the Knox? one and another were asking. For in the first lap Denison had been in second position. Haupt in the Chadwick followed Stricker, and then came Lytle, having passed both Luttgen and Denison.

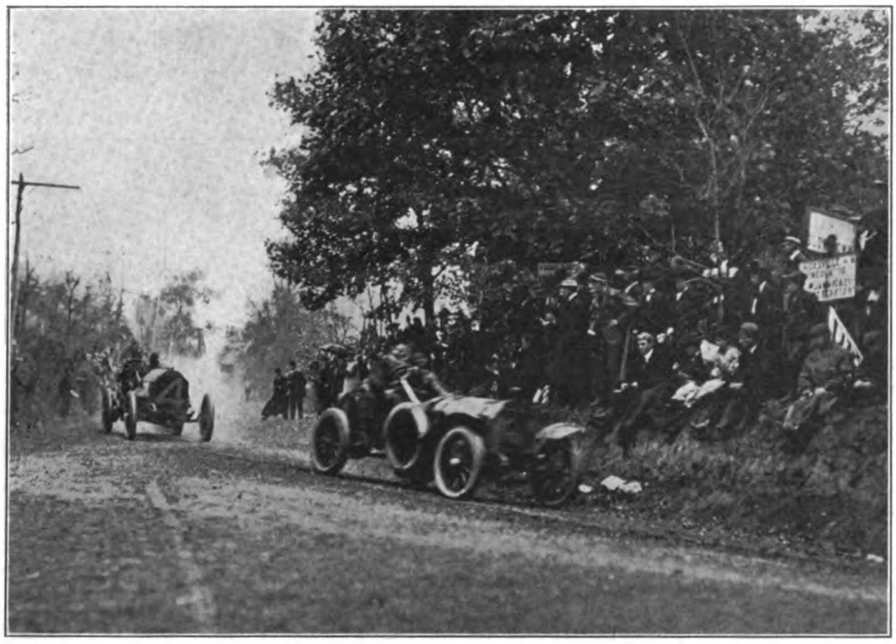
BIRDSEYE VIEW OF COURSE AT WOODBURY CORNER

close range. It is surprising, too, that more people did not think of that, for there was a very small crowd at the supply station compared with the mass that flocked at the Jericho turn, where, because of the sharp downhill "S" curve, incidents were expected to take the form of thrilling exhibitions of skidding, hairbreadth escapes, and the like. As is usual in such cases the thrills obstinately refused to happen and the spectators who looked for killings had to go away disappointed.

On the other hand, at the supply station, the spectators were rewarded with plenty of action, a tense moment when Stricker's Mercedes caught fire after being run in with smoking, waterless engine, and also to yell the time-worn injunction to "Get a horse!" Seymour heard and laughed.

All the others except Strang, in the Renault, passed the supply station on the first lap with exhausts spitting defiance into the muggy morning air. There was considerable speculation as to what had become of Strang, as he was one of the favorites, but even the telephone man could get no information from the grandstand except that he had trouble in starting. It was half-past seven when Strang finally appeared the first time, and then his car was skidding all over the road so badly that the crowd gave it a wide berth.

The first real burst of enthusiasm came when "Sunny Jim" Florida came flying



A fur-coated man in a made-in-Bridgeport car got apprehensive when he figured that Robertson in the Locomobile had been the 13th driver to start. His enthusiasm began to rise when the second lap showed that Robertson had worked from this unlucky position to ninth place. Still later in the morning, when the victory seemed to flit between Robertson and Lytle, with chances in favor of the former, the fur-coated individual became excessively joyful.

J. B. Ryall, in the Matheson, gave the watchers a four minute exhibition of quick action when he stopped on his second round. The steering gear had tightened up and Ryall and his mechanic poured buckets of oil on the "knuckles."

Digitized by Google

The second time Strang went past the supply station his car was skidding even worse than the first, and on his third appearance he moved so slowly that it could be seen that the car was minus its gear case. A few minutes before, Foxhall Keene had waved his hand to the crowd; the next round for the gate ensued. Ryall was the quicker to start, however, and he got on the course first, but Bourque passed him several hundred yards down the road.

Things were tame for three-quarters of an hour, until Haupt limped up with his magneto advance disconnected. While this

HAUPT, CHADWICK, OVERTAKING STRICKER, MERCEDES

his Mercedes was reported on fire at Jericho.

Seymour, who had been told to "get a horse," was still laughing when he turned into the enclosure at half-past eight to replace a flat tire and also to take on water, gasolene and oil. He had been in difficulties from the start, but still he was not discouraged, even when he lost nearly ten minutes at the supply station. The oil tank was the last to be filled and Seymour was already in the seat waiting for his mechanic to finish and crank up.

"S-a-a-y," he drawled at his helper, "For heaven's sake, hurry up! I want to go out and catch one of those two hundred horsepower Mercedes."

While Seymour was laid up in the supply station Lytle and Keene passed within a few feet of each other. Two minutes later Ryall stopped for the second time. While his mechanic tinkered with a disorganized speedometer Ryall attempted to fill his tanks. He picked up a five gallon can of gasolene, but his hands were slippery and the can jolted against the supply counter. Ryall got a shower of the fluid in his face. A lot of it got into his eyes and blinded him. The pain made him wince, but he displayed Spartan courage while an attendant salved his injured optics. The accident cost him 13 minutes.

While Ryall was laid up Bourque pulled in to replace a damaged spark plug and fill the oil tank. Both he and Ryall finished their tasks at the same instant and a race was being repaired all the tanks were filled and Designer-of-the-Chadwick Nichols seemed eager to assist, and in one case handed a wrench directly to the mechanic, despite the rules, which stated that "whatever supplies are demanded must be placed on the platform of the station. Failure to comply with the above will serve as a disqualification of the car." Nichols was very nervous and in his eagerness to hand water and gasolene to Haupt spilled a great deal of it on the platform. As Haupt was about to get into the car he remembered that he had not put the cover on the magneto and he asked the designer if he could go the remaining three laps without it.

"Huh," grunted Nichols, "the damn thing is no good any way. Go on."

Seymour had to stop again at 9:30. He had lost the radiator cap somewhere on the road and although the radiator had sprung a leak he was not discouraged. He filled it with water, stuck a piece of cotton waste in the opening and tied a handkerchief over the top.

"Well, we'll get that 200 horsepower Mercedes yet," he observed as he drove away. But the next lap he had to stop for water again and as the race was then practically over he didn't hurry as much as before. Denison stopped for a new spark plug at the same time.

The most picturesque scene of all occurred when Stricker and his Mercedes limped up to the stand at 20 minutes past 10 o'clock, with the engines smoking fearfully. The radiator pipes were dry as bones, so dry in fact, that oil had to be run through them instead of water for fear of cracking the cylinders.

Stricker has a vocabulary that is expressive, if not in dictionaries, and the disappointed driver had no hesitation about saying what he thought. The circulation fan was broken and Stricker got a hammer and tried to knock it off, his conversation with Conner, his mechanic, running something like this:

"Connor—bang—I think—bang—you are a—bang—old hoo—rip—doo. Well—bang—we'll get—rip—'em the—bang—next time—

HOT BRUSH ON A WELL GUARDED TURN

Digitized by Google

bang, bang—Well, if this—bang—isn't a hell —bang—of a note!"

Then Stricker stoped his hammering to express himself more freely. Just then Robertson flashed by.

"Go on, old lightning! Go on while you can. You may get yours before long."

Hardly a second later the Mercedes caught fire. The small crowd that had been listening to Stricker's expletives made a bee line for the road. Stricker and Connor scooped up a bucket of earth and tried to smother the fire, but that didn't suffice and just that moment a thoughtless stand attendant rushed up with a bucket of water which he was about to dash over the flaming engine.

"You do and I'll kill you," said Stricker as he grabbed the pail of water in time to prevent the engine from being hopelessly ruined. A piece of heavy burlap brought by a thoughtful Diamond tire camp attendant finally smothered the flames.

Only a few minutes after the Mercedes had ceased smoking the news of Robertson's victory trickled in over the telephone. Plenty of Locomobile enthusiasm materialized at the instant, but there was a greater patriotic demonstration over the fact that an American driver in an American car had won the classic cup contest. Some of the Loco "rooters" had a big flag with the numeral "1" on one side and "16" on the other. An enthusiastic spectator grabbed the flag from the touring car where it reposed, waved it exultantly over his head and yelled:

"'Ray! 'Ray f'r Bryan an' zhe Locomobile. 16 to 1. 'Ray!"

LOCOMOTIVES PARKED NEAR GRANDSTAND

PARKING SPACE OF THE MAXWELL CARS

AMID ACTION ON THE BACK STRETCH

As a matter of fact, to one whose interest in the event lies quite as much in its spectacular value as in its action as a contest, it well repays the effort to make a personal tour of that section of the course which seems to promise a maximum of variety and incident. A good sample of varied effects was promised—and delivered—last Saturday on the stretch which lies along the Jericho turnpike between the railroad crossing and Woodbury.

At the railroad crossing, a momentary horror was caused when the first morning train on the Wading River Branch of the Long Lsland Railroad arrived about half an hour behind its schedule, and after slowing down, was given its signal to go ahead, just as a car came into sight. A quick change of signals however, brought it to a stop while the car cleared the crossing. A couple of minutes later, just as it was blocking the course, a few late arrivals were treated to the sight of another of the racers, Chevrolet's Matheson, in fact, bearing down on it at great speed. The driver's judgment was good, however, and the expected accident was averted by about six feet. Shortly after 8 o'clock, a train running toward New York became a target for Haupt in the Chadwick, but removed itself from the course in season to permit him to go on with but an instant's application of the brakes and far less actual peril probably than, as the crowd saw it, appeared to exist.

Throughout this portion of the course, oil had been used freely, and this fact, coupled with the presence of water standing over from the early morning rain, made the handling of the cars a matter of extreme nicety. The minor bends, which ordinarily could have been taken without risk of any sort and at high speed, even as they were later on in the race, proved more than deceptive, and during the early rounds the drivers were forced to exert an amount of effort at the steering wheels which must have been terribly fatiguing. Seldom did a car pass without leaning either to one side of the road or the other, and usually at the little rise just east of the crossing, more or less side switching occurred, according to the tendencies of the car and the skill of the pilot.

Haupt, Stricker, Salzman and Strang were among those who had trouble of this sort, particularly at the top of the slight rise just under the banner which marked the approach to the railroad crossing. Strang, in fact, seemed under a cloud in this respect, throughout his unfortunate career in the race. Judgment is hastily made at such times, but it seemed that the car must be ill-fitted for its work in some way, so badly did it behave in this respect. Hardly did it pass without showing a tendency to swing from side to side, and it was evident that the driver's skill was being taxed to the utmost to keep in the center of the road and still maintain anything like a telling speed.

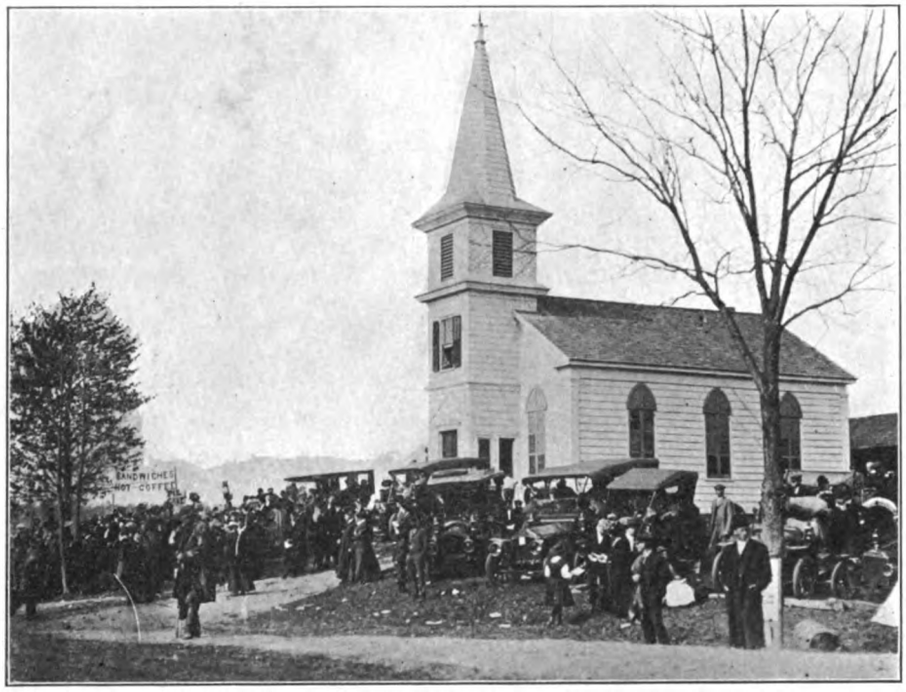
Lytle, on the other hand, was blessed with ample security, for his driving was marked by no deviations from the slippery path, and though his early rounds appeared to be made at comparatively slow speed over this section of the course, it was unquestionable that he was destined to figure well up at the finish. Florida, Robertson, Luttgen and Kilpatrick all appeared to have good control of their cars, though now and then one or another would experience a ticklish little skid way out to the side of the road, just where there appeared to be nothing to cause it.

"What machine is that No. '1'?" inquired a little curly haired constable, shortly after Florida had passed on one of early rounds.

"No. Where is it made?"

"Bridgeport! American machine?"

"—— Well long's its made here, it's all right. Long's an American machine wins it, I don't care."



The sentiment was heard many times during the morning and at different points along the course, but mostly from the native population, whose interest in a Vanderbilt race never was keener than at this time.

Along this back stretch, the course was not over-crowded, which was fortunate, as otherwise the deputies would have been de-

Digitized by Google

plorably unequal to the task of clearing a way for the drivers. There were few spots which had not their little groups, however, and where the woods came down to the road, touring cars would be found drawn up out of harm's way, while elaborate picnic layouts were spread in the undergrowth beyond, just within sight of the course and its action.

In contrast to the eager watchers of the race were sundry excited little knots of men which were to be seen here and there along the road toward Woodbury. At the very heart of the pack always, would be a mum-

CARS PARKED IN CHURCHYARD AT WOODBURY

my faced individual, hoarse voiced and slick, who deftly manipulated the three little shells, saying: "Nothing under this, nothing under this, nothing under this,"—which usually seemed to be true; or else shifting about the three delusive cards.

Inquiry as to why the deputy sheriffs paid so little heed to these hardy reapers brought out the statement that their instructions were confined solely to matters connected with clearing the course. About half a mile from the Woodbury turn, and just where Stricker was delayed for some time with ignition trouble during the middle of the race, a particularly thrifty quartette was plying the shell game and winning the "Fives, tens or twenties, boys." Less than a city block beyond, and over a knoll which was hardly high enough to drown the sound of their voices, were gathered together no less than eight hardy scions of the Long Island people, each bearing a special deputy's badge and number. The eight numbers were 302, 303, 304, 193, 294, 299, 297 and 298, and the proud wearers of the last three were seated side by side on a log and comparing score cards, while wreaths of strong blue tobacco smoke curled from their pipes.

Instances of constabulary inefficiency were numerous. Just to the west of the Woodbury turn, where the Chadwick car met its Waterloo in a broken driving chain, which delayed its passage for more than a half hour, two of these braves stood on the outside of the group which blocked nearly the whole of the road, and, beyond shouting a warning and themselves dodging out of the way, scarcely made any effort to get a passage free in season for other cars to pass.

At the Woodbury corner itself, toward the conclusion of the race, a native wearing the badge of a regular deputy sheriff of Nassau County, was found seated on a log directly in front of a large touring car which was headed out of a parking space inside the turn. Approached with the oft-repeated question as to whether he had any authority to quell gambling by the course, he replied that while the special deputies who were sworn in for the occasion, probably had no orders to look out for "crooks" of one sort or another, he was regularly on duty. "And I've stopped every game I've seen this morning," he added.

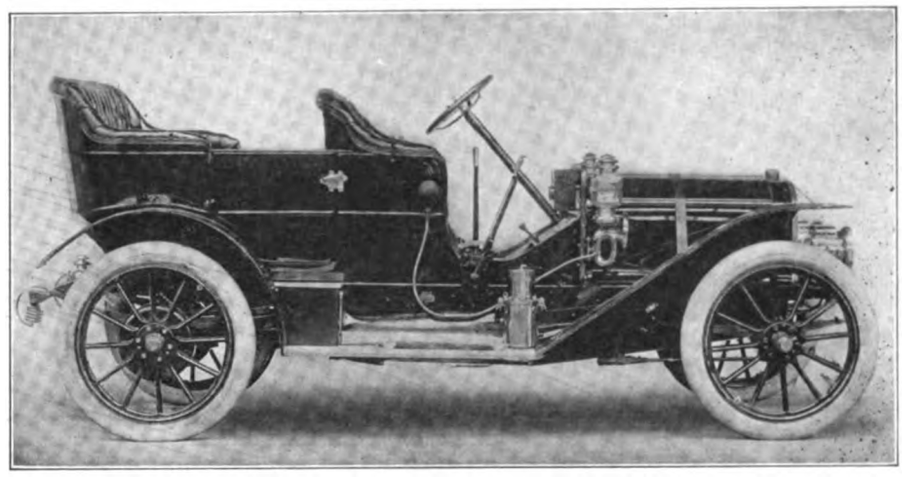
But when it was suggested that if he would but turn his head he would see another, which as a matter of fact actually was in vociferous progress directly back of the car, he replied that he had been posted where he was, and could not leave because the party in the car was trying to get across the course and he had been ordered to stop them, come what might.

In fact sharp badinage was even then in progress between the constable and a champion of the party who stood beside the car, and who explained confidentially to the former, that this was Police Commissioner Bingham's private secretary, Dan Slattery, who was more than anxious to get back to New York for the resumption of his duties. The deputy didn't care who he was, he said; his orders must be obeyed, and he stoutly refused to entertain the humorous suggestion that he turn his head, or go and apprehend a supposed pickpocket who was pointed out on the other side of the course.

As at every turn on the course, Long Island ingenuity was displayed to its utmost advantage in the luring of the visitor's coin. More than ordinarily luring, however, was the net spread by the followers of John Wesley, who worship on Sabbaths at the little white church just around the corner at Woodbury. Here large signs posted on trees and fences ran as follows:

PLACE YOUR
AUTOS HERE
ON
DAYS OF RACE.
APPLY TO
W. H. GILES, Sexton.

In addition to the income from the use of the lot as a parking place, chairs from the interior of the sanctuary were set out upon the porch and rented to the weary visitors at so much per sit, while against the fence of the adjoining grave yard a cooking range was installed, and several tables spread out and heaped with the good things of the neighboring farms. The cemetery itself also boasted a chair or two and a number of visitors who paid little heed to the epitaphs From a window well up toward the belfry leaned a muezzin, who, with book and watch called, not to prayer, but to witness the passage of the cars one by one, the numbers of which he could see from afar as they came down the incline beyond the turn. Half of what was made, went to Mr. Giles in his official capacity, it was learned, and the other half to the cause of the Methodist Episcopal church. How the venture turned out could not be learned, but one doubting sister who had pitched her tent just inside the corner and was serving a mysterious chowder to such as were anhungered, was inclined to question whether any great wealth had been accumulated. Because, as she said, most of the visitors "had fetched their own lunches, and didn't want nawthin' else."



At about a quarter to 11 word was received that Robertson had won. Instantly there was a jubilation, as at all other points on the course, and a newsboy who had been vainly trying to sell a special edition of a New York morning paper burst forth with: "Full acount, Robertson wins Vanderbilt Cup Race." The crowd started to break up, but was held partly in check. Ten minutes later Denison came along in his Knox, and just after he had passed an attempt was made to flag him as another message had been received at the telephone, stating that the race had been called off.

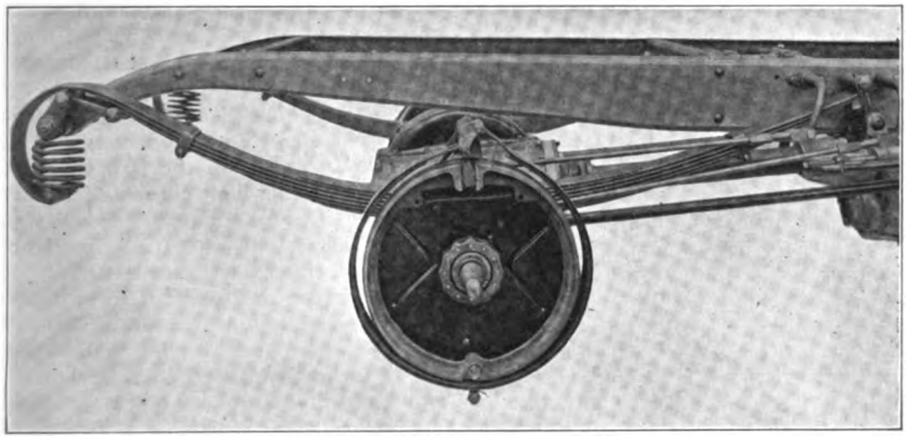
FOUR RAMBLER TYPES FOR 1909

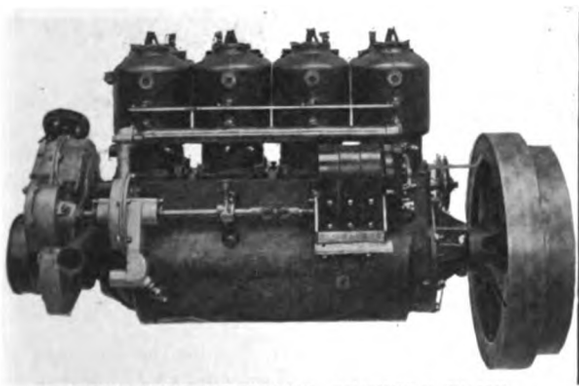


Announcements for the Coming Season Include One Entirely New Car—Important Changes in former Models.

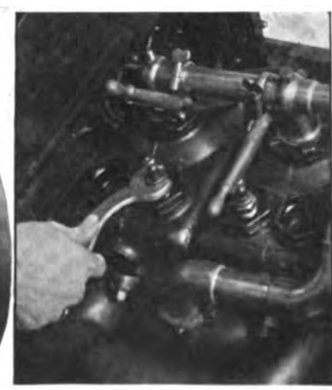
Four distinct types of Rambler cars are forecasted by the announcement of Thomas E. Jeffery & Co., of their plans for the forthcoming year. In addition to the models already made one entirely new car will be produced at the Kenosha (Wis.) factory for the output of 1909. Other models, though given new designations, perhaps, are essentially the same in design and construction as at present. The leader of the line will be Model "44," successor to the Model "34" in current service. Second to this is the new Model "45," while at 22 horsepower, and driven by a twin cylinder, opposed motor, the Rambler "Utility car," as it is called, remains practically undisturbed in its field. The fourth member of the group

RAMBLER MODEL "44"

is the Model '47," which differs from the last-named car principally in having seats for two or three passengers instead of the full five of the other.

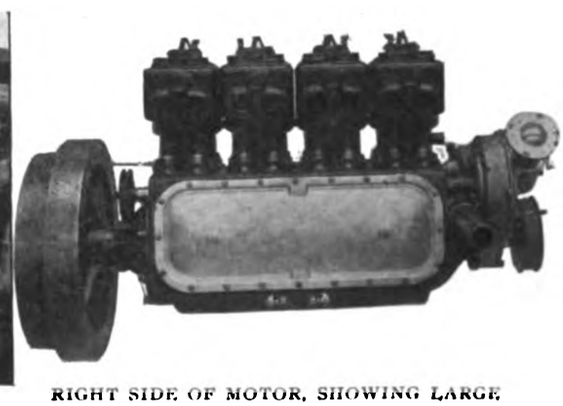


TRIPLE ACTION REAR SPRINGS AND BRAKES



Except in the matter of size, power and price, Models "44' and "45" are alike. Actual differences between them exist in the engine dimensions, the wheel bases, tire sizes, and body capacities. The Model "44" engine is four cylinder in type, and of 4½-inch "square" measurement. In its previous form it had an output of 32 horsepower, but by increasing the valve diameters, as well as the carburetter capacity 2 extra horsepower have been added to that figure. As heretofore, one of the most distinctive features of the machine is the offset crank shaft. The flexibility thus secured has been extended in the latest motors by the addition of 26 pounds extra weight to the rim of the fly wheel.

Another important change is the doubling of the face width of the two-to-one driving gears. A single-piece crank case is used, and the crank shaft is inserted from the rear end. The bearings are so constructed that they may be adjusted from the hand hole opening in the case without the necessity of dismounting any parts. The hand hole is placed on the right hand side of the motor and is of sufficient size to afford ample opportunity for adjusting the connecting rod bearings as well as the main shaft bearings. A small added convenience, useful in this connection is the adoption of quick detachable front mudguards, so arranged that they can be quickly dismounted in order to give ready access to the lower portions of the engine. By elevating the exhaust manifold slightly in the new models further convenience is secured in more easy approach to the valve stem, adjusting nuts and screws. Other changes made with similar ends in view include the more elevated position of the timer and the use of flexible cable for the primary as well as the secondary current.



An entirely new method of connecting the high tension terminals with the spark plugs is worthy of special mention. Instead of the all too familiar loose-stranded arrangement of heavily insulated wiring, the leads terminate in a fiber block, which, is affixed to a suitable bracket mounted on the upper water pipe. A metal strip fastened to the lower side of the block is designed to

LEFT SIDE OF MOTOR, SHOWING PUMP AND MAGNETO

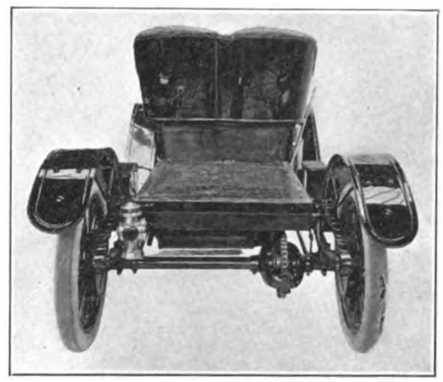
rest against the flat top of the spark plug, while the position of the block is secured by means of a thumb screw. Besides forming a convenient device for cutting out one or more cylinders for testing purposes, this arrangement also provides a partial cure

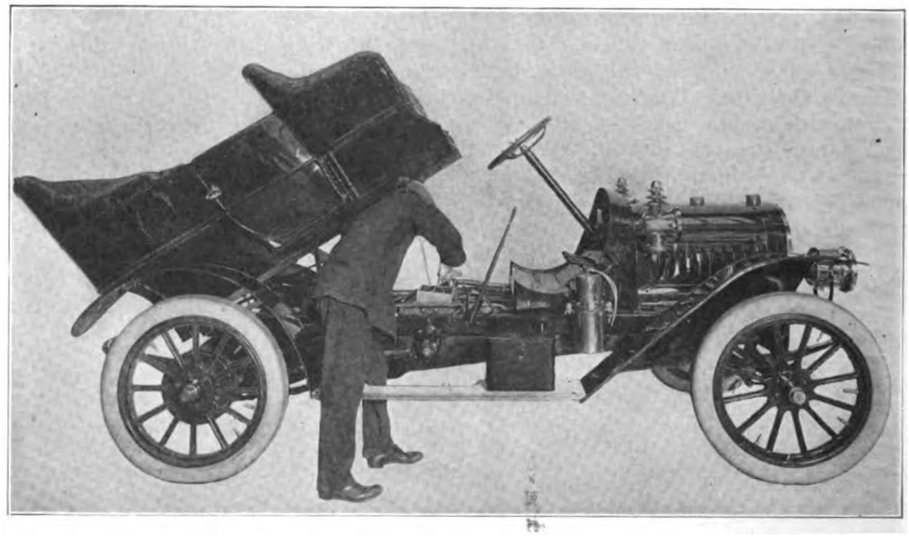


RAMBLER MODEL "41"—UTILITY CAR

for soot-fouled plugs, since by raising the blocks very slightly from the plugs, spark gaps of any desired width may be secured. To free the plugs in order to remove them from the cylinder, the blocks merely are lifted out of the way and the operation involves no handling of wires or terminals. Ignition is by jump spark, though the Bosch high tension magneto may be obtained on special order as an extra option.

The pump drive now is placed on the opposite of the crank case from the cam shaft, and the pump housing is made entirely separate from the crank case so that in the event of leakage at the stuffing box, no water can find its way into the motor. A new type of pet cock has been adopted, which is so contrived that a check valve, spring retained, prevents any possible loss of compression, while relieving any vacuum which may tend to occur in the cylinders when running down hill under closed throttle. A new location for the automatic oiler, as well as a 50 per cent. increase in its capacity, also improve the running of the machine not a little.

An improved form of direct-acting cone clutch has been made to supplant the balanced, inverted cone formerly employed, its construction involving the use of a pressed steel disc instead of the more common aluminum member. Easy means of adjustment is provided, while the use of a camel's hair pad in the bearing provided for releasing the clutch prevents spinning when changing gears. Improvements in clutch actuation include the shortening of the length of travel of the pedal, and an arrangement whereby the first 2 inches of brake lever movement secures the complete disengagement of the clutch. The change gear remains practically the same as heretofore. A minor exception is in the abandonment of the former method of gear shifting, by means of rocker arms and brackets located at the back of the gear box, and its replacement by a system of direct movement. To guard the reverse position a sort of gate lock is provided, which may be raised when desired, by pressing a button located in the foot board.



MODEL "41," SHOWING NEW REAR AXLE CONSTRUCTION

Such provisions as increases in brake leverage, the provision of a new method of hand adjustment for all the brakes, and increased size in the steering parts as well as improved methods of compensating for wear—are among the strong points which will be noticed in the new models.

The two two-cylinder models—"41" and "47"—have not been altered materially in preparation for the new season. The unit power plant, with its parts housed completely, in fact, is carried over without alteration. The floating type rear axle is mounted as heretofore on roller bearings at the hubs. A new feature of the construction, however, is the replacement of the aluminum housing which has been used on the models of the past two years, by a heavy forged yoke. This provides greater clearances and greater strength, without need for a thrust. Indeed its high road clearance is one of the strong points of the car. As the driven sprocket comes at one side of the center line of the car, it is enabled to dodge many obstructions which otherwise would interfere with it, thus giving the effect of a clearance even higher than it really is. The height of the wheels employed—34 inches—also adds to this desirable effect. The rear wheels are provided with pressed steel brake drums, which are 13 inches in diameter, and 2½ inches wide. A noteworthy convenience peculiar to this car is the tilting body which, as shown in the accompanying illustration, permits immediate access to any and all of the working parts of the power plant and renders the thorough care of the machine a relatively simple matter. The design of all the parts tends toward ease of access and simplicity of adjustment.

Among the few alterations which this model is undergoing may be mentioned the enlargement of the steering wheel from 14 to 17 inches, improved construction in the wheel itself, improvements in carburetter design and timing yielding a very material increase in power, despite the fact that the rated output still remains at 22 horsepower. The wheel base is 106 inches, and the tires are 34 by 4.

PREVENTION OF EXCESSIVE WEAR

Proper Placing of Bearing Parts—Oil Retaining Devices and Protection Against Mud—Methods for Lubrication.

Within limits it may be said that the life of a motor car depends on the susceptibility of its parts to the destructive influences of abrasion, or in other words, plain wearing of connecting parts. Accidental causes of derangement aside, it may be considered that the broadest and most useful field for improvement in modern motor car practice lies along the lines of alteration which in one way or another tend to prolong the life of the bearings. Touching upon the causes and methods of prevention of wear, F. H. Royce, in a paper read before the British Association in Dublin, also takes occasion to score roundly the designers of many well appearing cars, who are inclined in his opinion to neglect many of the basic principles of mechanics.

"It is at first difficult to believe, but an examination of cars at an exhibition such as the annual show held at Olympia and the Grand Palais, Paris, makes it quite clear that, while a certain small proportion of chassis are obviously designed by men who are good engineers and who have taken great pains and care to make their designs as nearly mechanically perfect as the conditions will allow, there are many chassis which show that the designer is either extremely careless concerning, or has little knowledge or perception of, the science of mechanics," is his trenchant observation. "These latter chassis may, after a certain number of poor pieces have been eliminated, be more or less workable, and may, if well manufactured, satisfy the average purchaser's examination; but, owing to poor mechanical features, are bound to be costly in maintenance.

"For instance . . . . in such important features as connecting rods, shafts in change gear boxes, road wheels, and wheels running on studs, the bearings are so disposed that the load or pressure does not fall in the center of the length of bearing; or, in the case of two rows of ball bearings, does not fall between the two bearings; or, worse still, falls beyond and quite outside the bearing.

"Absence of regard for the mechanical canon that pressure should either be centralized on or equally distributed along the whole length of a bearing is undoubtedly the cause of wear in many motor cars.

"Road and other stresses cause twistings and deflections which may throw out of alignment various parts. Take, for instance, a comparatively rigid crank chamber fixed to the frame. The frame, owing to road irregularities, twists, and its side members thus act as powerful levers tending either to break the attachments or twist the whole crank chamber. In the latter case, the bearings of the crankshaft become deflected from true axial alignment, causing excessive load to fall on small areas. Rapid wear, if nothing worse, must result. . . .

"Again, there are crank shafts which have evidently insufficient support, such as double cranks with no bearing between them. In these cases, again, we have the distressing knowledge of crank pins bent out of true alignment. Excess of pressure on local spots, and the crushing out of lubricants at such spots, must, we know, be attendant under these conditions, and more or less rapid wear must result. . . . .

"Another instance of improper design is found in cars in which the torque rod, used to control the back axle, is so fixed that no provision is made to allow of the movement which must take place when one back wheel rises higher than the other owing to its surmounting an obstruction on the road, or owing to an uneven road surface. In such a case some slack must exist in the joints or the part must bend. . . . .

"Another point that may be mentioned in connection with design is the importance of arranging that parts which are subject to much friction (such as gears, road wheel bearings, and universal joints) should not only be fitted with oil-retaining devices, but also protected against mud and water.

"One sees universal joints on quite a number of expensive chassis which are not provided with any case at all, or perhaps provided with cases which cannot retain oil against the high centrifugal force engendered. It is hard to imagine the lubrication staying on a joint revolving at from 300 to 1,500 revolutions per minute, if it has the slightest chance to escape. In the absence of an effective oil-retaining case, these revolving joints may be trusted to get rid of any oil or grease which may be adhering to them, just as effectively as the hydro-extractor may be trusted to throw out the liquid. The same force will act equally well in either case. . . . .

"It must, however, be remembered that a case which is oil-retaining need not necessarily be water-excluding. Especially does this remark apply to road wheel hubs, which often allow water to be admitted. This is disastrous where ball bearings are employed.

"The choice of materials used in the construction of a motor vehicle are chiefly important for two reasons: 1. To avoid breakage; 2, To resist wear. . . . .

"If the film of lubrication could be perfectly maintained, the material used for the wearing surface would be quite unimportant. Aluminum, one of the worst wearing metals, might be employed; but one cannot rely on the lubricating film always keeping the surfaces out of contact. In the case of the crankshaft, the position of affairs is aggravated by the fact that the steel, in order to be really tough and reliable, is said to be in a state of pearlite, which, it is stated, under conditions of imperfect lubrication and in contact with hard bronze bearings is very likely to seize. Hence the success of such alloys as will run with such a steel shaft for a time fairly well without lubrication. Probably the most remarkable of these in that respect is lead, and alloys containing large proportions of lead, but the writer has always thought these too plastic to stand the severe mechanical stresses they are subject to in motor car work. Genuine Babbitt metal of tin, antimony, and copper seems excellent for crankshaft work if properly applied.

"In almost every other part of a car the wear is taken on ball bearings, or the parts are capable of being case-hardened.

"Excellent results can be obtained with a properly case hardened shaft or other surface running with bronze bush or bearing. This combination is not nearly so exacting with regard to perfect lubrication as when one of the surfaces is of unhardened steel. Care should be taken to secure that the case-hardening is of sufficient depth and is free from soft places, the shaft being ground down a few thousandths of an inch to exact size on a precision grinding machine, and well polished.

"Referring to gear wheels, which should in nearly all cases be thoroughly case-hardened, the selection of material is more important under the heading of breakage, because any mild steel will case-harden almost glass hard, but unless carefully selected and heat-treated, may be as brittle and weak as a zinc casting.

"Ball bearings carefully arranged and well made are wonderful things, carrying enormous weights and bearing considerable ill-treatment, but the materials for these deserve careful selecting. It seems that both balls and races should be made of a good high carbon steel (although even this is improved with a small percentage of chromium), but good results have been obtained with exceedingly deeply case-hardened mild steel. Really, this amounts to much the same thing as using high carbon steel, as the hard casing, to be satisfactory, should go nearly through. . . . .

"Next, let a warning note be sounded as to what kind of oil to use. This can be roughly outlined as follows: Do not use thin oil; do not use stiff grease; use oil of ample viscosity (body), and of good lubricating properties; and lastly, use the very thickest oil that will always be liquid, for all parts except the engine. . . . .

"Reverting for one moment to a question of design, it should be added that there are points where the film of lubricant cannot be continuously maintained. In these positions the ball bearing and the case-hardened surface come as a valuable aid to the designer."

The three points which the author regards as essential to success in the prevention of wear are: "Satisfactory (and, as far as possible, automatic) means of lubrication; ample or thoroughly case-hardened surfaces; protection against mud and water."

TOWNS MAY BAR MOTOR TRAVEL

Massachusetts Supreme Court Sustains Closing of Roads—Denies Existence of Natural Rights in Highways.

It has been definitely decided by the Massachusetts Supreme Court that the selectmen of towns and the aldermen of cities have the right to exclude automobiles and motorcycles from certain streets of a town or city in addition to their full power to regulate the speed of automobiles in their localities. This important decision is the outcome of the test case of the Commonwealth vs. Arthur L. Kingsbury, of Northampton, Mass. The case reached the higher court on appeal from the district court of Franklin county, which found the defendant guilty of running his car over a closed road in Ashfield.

The contention of the defendant was that he had as much right to run his automobile through a town or city highway, as the driver of a horse-drawn vehicle and that the law under which the way in question was closed, deprived him of his rights guaranteed by the constitution of the state. It was further contended that there was nothing dangerous about an automobile as an automobile, and that with the laws now on the books regulating the speed of such vehicles, there was no reason for interfering with the reasonable running of a motor car on any public way.

District Attorney Irwin declared that the experience of the State had been such as to make it appear advisable to the Legislature that very full powers, as to the exclusion of automobiles from certain ways, should be delegated to the selectmen of towns and aldermen of cities. He contended that there was an element of danger in the automobile itself, due to the uncertainty attending its control by the driver, and that in view of that uncertainty, it was entirely reasonable that thoroughfares should at the discretion of the town and city authorities, be closed to travel.

The Supreme Court's opinion was written by Chief Justice M. P. Knowlton, of Springfield, and embodies the views of District Attorney Irwin, his fellow justices concurring.

The Kingsbury case began in September, 1907, when a complaint was filed with the district court of Franklin county, charging the defendant with having operated his car over Center street, Ashfield, which had been closed to automobiles in accordance with a notice posted in the street to that effect. The defendant admitted that he did operate an automobile over the road in question; that he knew that automobiles had been excluded therefrom; that he was conveying in his automobile a friend who desired to visit Mrs. Howe, his sister, who resided on that street; that Mrs. Howe's residence could not be reached without traveling over some portion of a "posted" highway; that the defendant took the shortest of three "posted" roads in going to Mrs. Howe's; that the highway was an ordinary country road, the traveled part of which was about 12 feet in width.

Kingsbury lost his case and appealed it in November, 1907; then lost again. The recent decision of Judge Knowlton upholds both of the former ones in every respect. The court holds that the selectmen of Ashfield in making the regulations in question, acted under the police powers delegated to them and the other selectmen, by the legislature.

A portion of the District Attorney's argument which the court upheld was as follows:

"The statutes are presumed to be constitutional. This presumption prevails until the contrary is shown. In the enactment of a statute good faith and knowledge of existing conditions on the part of the legislature are presumed.

"The operating of automobiles in the public ways may be regulated under the police power of the commonwealth. Nor is their regulation by the police power repugnant to the constitution as special or class regulation. The states have a right to enact laws applicable to a given class of individuals only, so long as the classification is reasonable and not arbitrary. The 14th amendment to the United States constitution does not control the states in the exercise of the police power.

"The police power is inherent in the state. It is the central force, the long and strong arm of organized society, compelling that which should and restraining that which should not be done. . . . . Through its operations the legislature has plenary powers over the public ways. . . . . The commonwealth exercises its control over the public way either by direct command or by delegating authority to local municipal authorities, specified commissions and boards.

"These matters are the concern of our legislature by the power granted to it by the organic law of the commonwealth. Chap. 1, section 1, article 4, reads: 'And further, full power and authority are hereby given and granted to the said General Court from time to time, to make, ordain and establish all manner of wholesome and reasonable orders, laws, statutes and ordinances, direction and instructions, either with penalties or without, so as the same be not repugnant or contrary to this constitution, as they shall judge to be for the good and welfare of this commonwealth, and for the government and ordering thereof, and of the subjects of the same.'

"In the view of the powers so granted, and of the way in which the same have been exercised by the legislature, with the approval of this court, may it justly be claimed that the ubiquitous meanderings of the automobile upon our public ways may not be regulated thereby?

"The defendant claims that 'the use of highways by automobiles is a natural, ordinary and reasonable use of them, and automobiles have as much right upon them as horse-drawn vehicles,' and that the "legislature has not, in the exercise of the police power, the right to make special regulations excluding automobiles from particular roads and ways.'

"Perhaps it may be permitted to suggest that the use of public ways by these machines has been unnatural, extraordinary and unreasonable; hence the legislature has undertaken to curb them a bit. In passing, it may be said that there are no natural rights in any person in public ways, such rights are developed from the state."

Court Defines Gasolene Storage.

In a verdict handed down by the Superior Court at Barnstable, Mass., on Saturday last, 24th inst., it was clearly established that a special license from local authorities to store gasolene is not necessary when the only gasolene on the premises is kept in the tank of an automobile. The decision was reached in the case of Henry C. Lambert, of Hyannisport, and is of especial interest to Massachusetts motorists who stable their own machines.

The case created no little commotion for Lambert had allowed as many as five motor cars, owned by summer residents, to be stored in his barn last July, despite the refusal of the selectmen to grant him a license. He was arrested in consequence. haled to court, from which he did not escape until he had been found guilty and fined $50. He appealed the case and continued to rent his barn for motor car storage in the same old way and the next month he was arrested again and fined $50 more on the same charge. Lambert went home and re-opened his barn for business once more and appealed the case for the second time —in this instance to the Superior Court

When a jury was finally impaneled, Justice King took the case under advisement on this statement of facts agreed to by District Attorney James M. Swift and Attorney Ellsworth: That Lambert rented his barn for the storage of automobiles, five in number; that buildings were within 50 or 100 feet of said barn; that each machine was propelled by gasolene and had gasolene in the tanks of the car, sometimes as much as 20 gallons in a car; that no gasolene other than that in the tanks on the cars was kept in the building; that he had no license to keep or store gasolene on the premises. Much to the chagrin of the indignant villagers from the "Port," the court ordered the jury to bring in a verdict of "not guilty."

Motor Races for Ohio State Fair.

A series of automobile races is to be held in Dayton, O., Saturday, October 31, at the State fair. In addition to the regular races, a number of novelty events, and motorcycle competitions will be on the program.

WHO WANTS AN "ENDORSEMENT"?

Made to Suit While You Wait—It Looks Official and Comes Easy—How the Game is Worked.

The old familiar "United States Trade Reports," like its twin brother the "United States Health Reports," is still "doing business" in the same old way. The "Trade Reports" usually is being published whenever its proprietors get hold of a "good thing." Just now they appear to be looking in the automobile industry for things of the sort and any manufacturer who has either a motor car, a motor tire or even a platinum point which he desires to have "endorsed" as being "without an equal," or "undoubtedly the best on earth," or "the most hygienic in the world," will not have the least trouble in obtaining the "endorsement"—provided he invests in a sufficient number of copies of the "United States Trade Reports."

If the manufacturer is of the same stripe as the publisher of the alleged "reports" he will send reprints or marked copies of the "endorsement" to his friends and customers and if they are "easy" they will swallow the dose without a gulp; if they reside abroad they will not only swallow the puff but will become possessed of the idea that the "endorsement" is a more or less governmental endorsement, which idea is designed to be conveyed by the title of the publication, which usually consists of a lot of overripe standing matter into the midst of which each "endorsement" is dropped as the "good things" are gathered in.

The manner in which owners of these alleged "United States Reports"—which repeatedly have been exposed—operate is shown by the stuff they are now circulating in the automobile trade. When the "good thing" is selected he receives a letter of the following tenor:

The enclosed article is an editorial prepared on the subject of Auto Motors, which we intend to publish in our columns. Our policy of furnishing reports on any commercial matter about which our readers may request information, brings us numerous inquiries on all subjects pertaining to trade. This editorial gives facts that are needed and will be appreciated by a large number. As we have highly endorsed your make of ———, and as we desire to be as correct and comprehensive as possible, we ask that you add to or alter same as you may think best, and return as soon as possible. If you have any cuts that will illustrate the subject, kindly loan them to us and we will return them promptly.

As this is an editorial of course there is no charge for the publication and if in addition you can use any extra copies of the issue in which it will appear, we will be pleased to make you the following special reduced rates, as we are desirous that you should get as much benefit out of it as possible.

The price of the United States Trade Reports is 15 cts. per copy, but we can supply you with 10 at 12 cts., 250 at 10 cts., 500 at 9 cts., or 1,000 or over at 8 cts. per copy, shipped to you. Or, if you will send us a list of names of those whom you wish to reach, we will mail marked copies to such, without any extra charge to you for the postage, wrapping, addressing or marking.

Although the publication does not depend on an order for copies, such an order will be appreciated by us.

Awaiting an early reply with corrected copy we are,

Yours very truly,

UNITED STATES TRADE REPORTS.

The "enclosed article," which constitutes the "endorsement," almost invariably is as follows:

THE BEST MAKE OF ———

We fully appreciate the difficulties the prospective buyer finds in obtaining a truthful and correct answer to the question, "Which is the best make of ———?

In the first place, he himself cannot know all the different kinds, and therefore cannot decide for himself.

Second, he cannot depend on the opinions of others, as they, like himself, cannot know all the various makes, or may be prejudiced in favor of the kind they use.

Third, he cannot take his choice from reading matter and advertisements of manufacturers, since one and all believing they are right, and justified in saying so claim their respective make the best.

Fourth, he cannot expect to have his question answered by any journal devoted to the trade, for in so doing such journals would commit financial suicide, since all other manufacturers, except the one given as the best, would at once withdraw their advertising patronage.

In view of the difficulties to a correct decision, this paper decided to make a thorough investigation, the result of which would be a decided answer as to which is the best. We fully realize the responsibility of making such a decision, since we are aware that our readers will accept it as final and worthy of fullest credence. For the benefit of new readers we wish to state that such faith on the part of our old readers is caused by their knowledge of the invariable method pursued by the Reports by which we can conscientiously give an independent and unbiased report on any article manufactured. This method consists in examining closely all the various makes, by means of our editorial and reportorial staff, without the knowledge of any manufacturer interested, and, further without making any charges, accepting any gifts, or soliciting any advertisements from any one whose wares we may pass upon.

As a result we are prepared to state that there is no make of ——— on the market today equal to those manufactured by the ———, of ———. These ——— are made of the best material, are durable in use, perfect in construction and will give satisfaction at all times.

The company is thoroughly reliable in every respect and can be depended upon. Their business is conducted on a line that is pleasing to each and every customer, and promptitude is a special feature of their business methods. They also stand high commercially.

Our interested readers will do well in addressing them direct, as we are sure that all dealings with them will prove mutually beneficial and profitable.

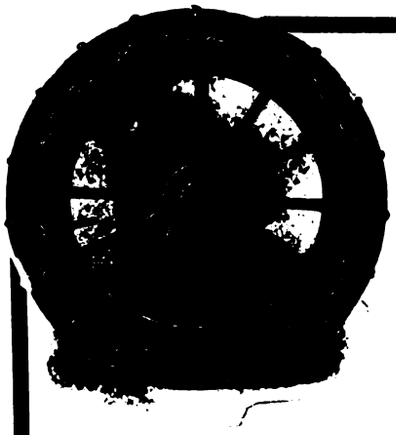
Mexico Uses 1,600 Automobiles.

Mexico at present boasts the use of some 1,600 automobiles. Of this number 1,200 are in use in Mexico City alone.

PRICE CUTTERS GET A SETBACK

Accessory Makers Will Refuse Supplies to the "International Automobile League" —Curtin Blocks Its Game.

Many prominent makers of automobile accessories have writen to Thomas E. Curtin, of the Curtin-Williams Automobile Co., of Columbus, O., declaring that the International Automobile League, an alleged association, which promises cut prices on motor supplies, cannot obtain goods from them to be sold at less than the regular prices, and that they will prevent, so far as lies in their power, the sale of their products either to the league or its officials. The president of the league recently wrote Curtin offering to waive the $50 fee which the league says it ordinarily exacts, if his company would be the first to represent them in Columbus. Curtin replied that if he wanted to cut prices he could do so without paying for the privilege, and later addressed some remarks to the Columbus Automobile Club on the subject. As his remarks somewhat interfered with the league's negotiations with the club, Curtin was written to again and taken to task. His answer is the exhibit of the accessory makers' letters, showing their disposition toward the league.



Boom in British Factory Sites.

According to American Consul Frank W. Mahin, of Nottingham, the effect of the new British patent law, which provides that articles produced under domestic patents be manufactured in England, already is manifest in arrangements which are being made for the introduction of new factories. The representative of a British firm making a specialty of securing factories and factory sites for applicants is quoted to the effect that many applications have been received from foreigners, induced thereto by the provision of the new law. An important feature of the applications already made is that the manufacturers demand works much larger than are necessary to make the patented article, giving as the reason that they can not run works in England on the patents alone, and therefore intend to make other wares which have hitherto been imported ready-made. Consequently, the volume of new manufacturing business brought into the country is expected vastly to exceed what is directly attributable to the influence of the new law.

Spain's Census of Motor Cars.

A recent estimate places the total number of motor cars in present use in Spain at 3,000. They are distributed as follows: Madrid and district, 500; Barcelona and district, 600; Gipuzcoa, including San Sebastian, 300; Vizcaya, including Bilbao, 200; Palma, Balearic Islands, 300; Seville and district, 100; all other places, 1,000.

The Week's Patents.

894,291. Vehicle Wheel Rim. Edwin C. Shaw, Akron, Ohio, assignor to B. F. Goodrich Company, Akron, Ohio, a Corporation of Ohio. Filed Feb. 20, 1907. Serial No. 358,460.

1. In a vehicle wheel rim the combination of a channel iron having a permanent tire flange mounted thereon, a transversely split ring carrying a second tire flange, downwardly extending lugs upon the terminals of said ring, a slot in said channel iron adapted to receive said lugs and means for securing said lugs within said slot, consisting of a bolt having a flaring head shaped to enter a recess in the split ring and a shaft adapted to pass through and to be secured beneath the channel iron.

894,292. Vehicle Wheel Rim. Edwin C. Shaw, Akron, Ohio, assignor to B. F. Goodrich Company, Akron, Ohio, a Corporation of Ohio. Filed Feb. 20, 1907. Serial No. 358,462.

1. In a vehicle wheel rim the combination of a channel iron having one tire flange permanently attached thereto, a second tire flange mounted upon a removable transversely split ring, a retaining flange upon said channel iron, downwardly extending lugs near the terminals of said split ring, and a key adapted to pass through perforations in said lugs, and to seat against the under surface of the channel iron.

894,293. Vehicle Wheel Rim. Edwin C. Shaw, Akron, Ohio, assignor to B. F. Goodrich Company, Akron, Ohio, a Corporation of Ohio. Filed Feb. 20, 1907. Serial No. 358,464.

1. A two-part rim for vehicle wheels comprising one member seated upon the wheel felly and provided with a retaining seat for the second member; said second member comprising a transversely split ring carrying a tire retaining flange; and means for pinning said second member to said first member, consisting of a bolt having a butterfly shaped head adapted to seat within a recess common to the terminals of the second member, and a shaft adapted to pass through said first member and to engage with a nut seating there-beneath.

894,327. Change-Speed Gear. John Johnston, Putney, London, and Harry W. Buddicom, Nannerch, near Mold, England. Filed May 9, 1905. Serial No. 259,622.

A change speed gear comprising a driving shaft, two sun bevel pinions, one loose on and one keyed to, the driving shaft, sun bevel wheels loosely mounted and having concave webs and sleeves integral with said webs, a sleeve integral with the loose sun pinion, planet pinions meshing with the sun wheels and pinions, radial pins for said planet pinions, a concave member keyed to the driven shaft and having bosses for supporting the outer ends of the pins, a sleeve integral with the inner ends of the latter, a light casing inclosing the gear wheels and pinions, and brake drums outside the casing and mounted on the sleeves of the sun wheels and of the loose sun pinion, said sleeves extending through said casing, substantially as hereinbefore set forth.

894,431. Shock Absorber for Vehicles. Edward A. Garvey and Christopher A. Garvey, St. Louis, Mo. Filed Sept. 23, 1907. Serial No. 394,136.

1. The combination, with a vehicle having a body frame, an axle, and a radial arm pivoted to said body frame and supported by said axle; of a saddle supported by said radial arm, a carrier supported by said arm, a pneumatic bolster mounted upon said carrier and a main spring connected with said radial arm and said saddle and yieldably supported by said bolster, substantially as set forth.

894,444. Controlling Device. Wellington P. Kidder, Boston, Mass. Filed May 18, 1903. Serial No. 157,525.

1. The combination of a pair of hand levers with an intermediate swing interlock, and connections whereby one of said levers is adapted to operate a brake and clutch and whereby the other of said levers is adapted to operate a change-gear mechanism.

894,473. Power-Changing Mechanism. Robert Symmonds, Jr., Kenosha, Wis., assignor to Thomas B. Jeffery, Kenosha, Wis. Filed Dec. 14, 1905. Serial No. 291,697.

1. In a power changing mechanism, the combination with a driving element, of a driven element, an eccentric rotated by the driving element, and means interposed between said eccentric and the driven element for rotating the latter in the direction of rotation of the driving element or in the opposite direction.

894,493. Pneumatic Cushion for Vehicles. Edward A. Garvey and Christopher A. Garvey, St. Louis, Mo. Filed Jan. 9, 1908. Serial No. 409,928.

1. A pneumatic cushion for vehicles having a cushion carrier, comprising a pair of cushion sections each having an open inner end, a main coupling having necks, means for securing the open inner ends of said cushion sections to the necks of said main coupling, and means for securing the main coupling to the cushion carrier.

894,526. Spring Wheel. Henry Neubert, Chicago, Ill. Filed April 27, 1907. Serial No. 370,579.

1. A spring wheel comprising a central structure including a hub and a felly, a plurality of semi-elliptical springs located between the felly and rim, guides secured to the rim and extending radially to the wheel and partly inclosing the springs and felly,

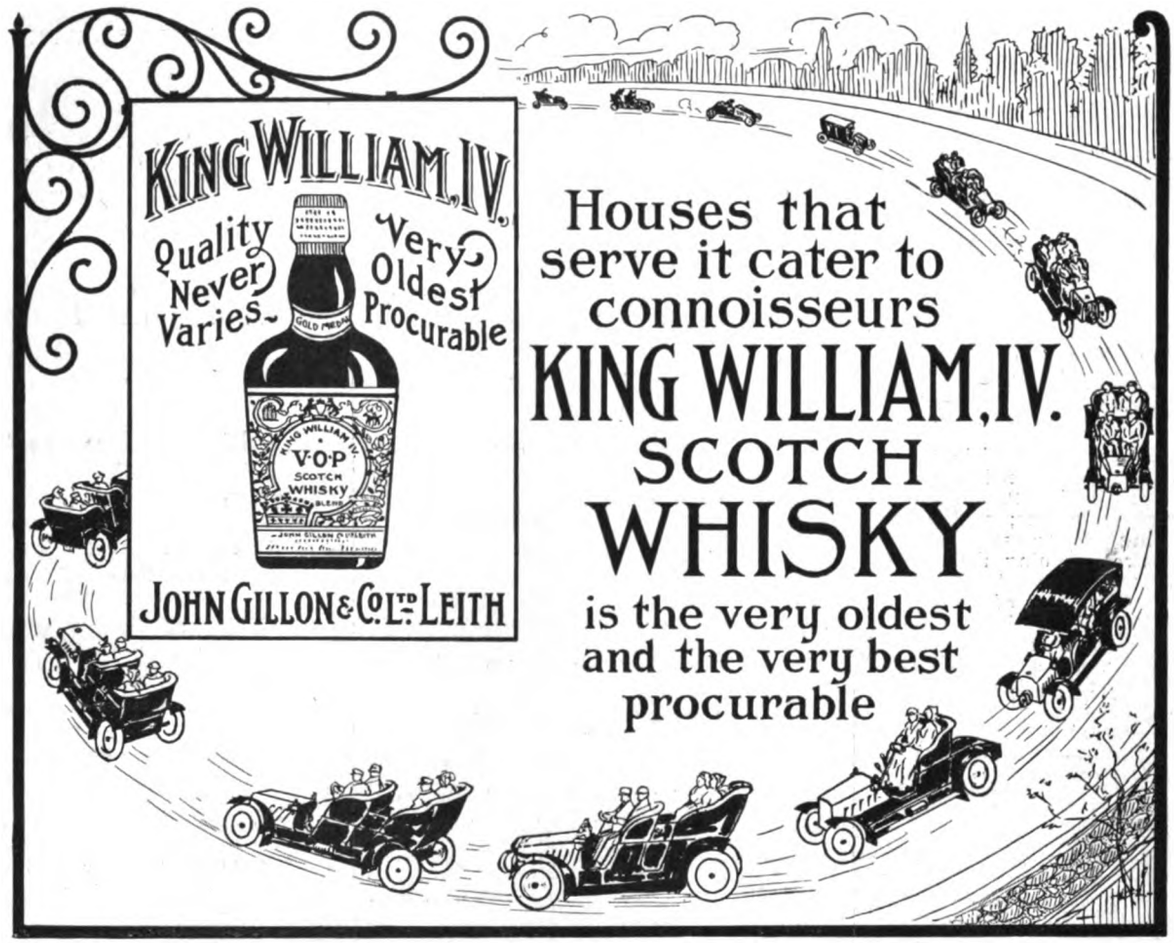
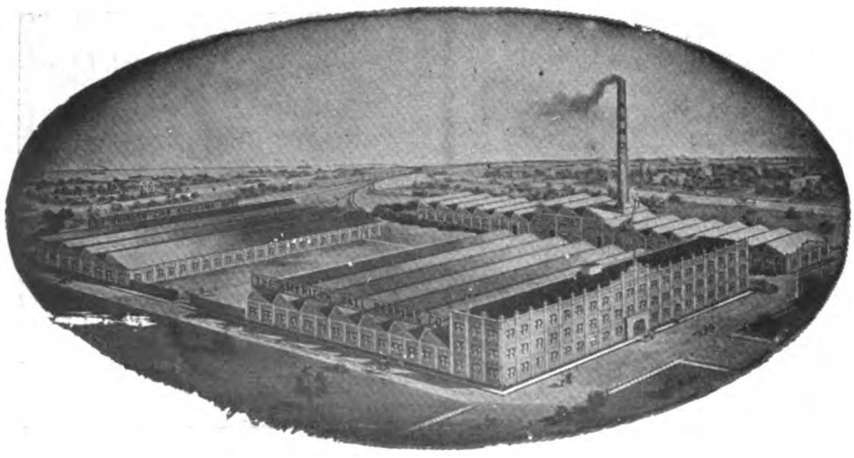
894, 586. Pneumatic Pump. Albert Brest, New Castle, Pa. Filed Oct. 19, 1907. Serial No. 398,186.



1. A pump attachment for pneumatic tires comprising a pump cylinder supported at one end on the wheel rim, a yoke sucured to the wheel hub centrally of the latter and to which the other end of the pump cylinder is connected, said yoke provided at its outer end with a bearing, a pipe communicating with said pump cylinder intermediate the ends thereof and having its outer end extended angularly and received in the bearing of said yoke, a frame fixed on the wheel hub adjacent one end thereof and provided near each end with a bearing, a shaft mounted in one of said bearings and carrying a crank, a piston within said pump cylinder to which said crank is connected, a piston arranged in the angularly extended portion of said pipe and having its rod extended through the other bearing of said frame, a clutch member rigidly fixed on the axle of said wheel, a second clutch member movably mounted on said axle and normally held out of engagement with the rigid clutch member of said piston rod, and a pinion on said shaft to engage with the movable clutch member when the latter is in engagement with the rigid clutch member whereby motion is imparted to the piston in said pump cylinder.



894,609. Wheel Specially Adapted to Receive an Auxiliary or Spare Rim. Thomas M. Davies, Llanelly, England. Filed Feb. 18, 1908. Serial No. 416,468.

1. In a wheel, the combination of a rim adapted to carry a pneumatic tire, and a laterally projecting flange fixed to such wheel and adapted to receive the clips carried by an auxiliary rim, substantially as set forth.

894,656. Carburetter for Internal Combustion Engines. John Johnston, Fulham, London, England, assignor of one-half to Harry William Buddicom, Penbedw, England. Filed June 3, 1907. Serial No. 376,948.

1. In a carburetter, a disc valve, a seating therefor, an air passage leading to the valve and oil holes leading to the face of the seating and adapted to be closed by the valve, said valve and seating having between them when the valve is open, a throat which first converges in the direction, substantially as described.

The output of complete Front and Rear Automobile Axles of this plant exceeds the capacity of all competition combined.

Stevens-Duryea
LIMOUSINES AND TOURING CARS

WHAT concerns you is not the size of the engine nor the horsepower the maker claims for it. You are only interested in the results—hill climbing—road speed—power in sand, etc.

We have said a lot at various times about getting a greater proportion of the engine horsepower delivered to the rear wheels of the Stevens-Duryea than any other car. There never was anything easier to satisfy yourself about—a bit of sandy road—a stop-watch—the Stevens-Duryea's time vs. the other car's time—the size of the Stevens-Duryea engine vs. the size of the other.

TRY IT.

Send for Stevens-Duryea literature.

1909 Model 45 H. P. Toy Tonneau, $3000

The Car They Copy

WHEN a car is only a copy of existing rivals, it is usually backed by inferior genius. The car to get is the one that is copied—the pioneer.

The Haynes is the oldest American car. Our model A was built in 1893. We gave to the world the large wheels, aluminum parts, side-entrance body, electric ignition and a host of minor features which are now universal.

The genius of Elwood Haynes who blazed the road of successful invention in the past is still with us, and the Haynes car is still ahead of them all in the superior development of various vital parts. The Haynes clutch, the ratchet gears, the roller pinion and sprocket direct drive, the two fly-wheels, the water-cooled brakes are all distinctive, and we expect that all automobiledom will copy them when the patents expire. But till then the Haynes is the car for the man who wants high power (45 H.P.) with direct drive, no vibration, ease of control and practically unending, unfailing serviceability.

AGENTS WANTED. If you have been agent for a maker that blew away in the late financial flurry, you will appreciate the opportunity to line up with a company that has survived the vicissitudes of fifteen years. Good territories this year for the right men.

SPECIFICATIONS OF THE HAYNES FOR 1909

Motor—4 cylinder, 4¼ by 5.
Water Cooled, with very large water jacket.
Drive—Shaft drive, with Haynes roller-pinion and sprocket at the rear axle, which minimizes friction and side thrust and eliminates noise entirely.
Clutch—Haynes patent contracting steel band upon bronze drum.
Carburetor—Latest type Schebler, water jacketed.
Lubrication—Gear driven McCord oiler.
Ignition—Bosch Magneto; also battery system with single coil and separate set of plugs.
Bearing—Roller bearings used throughout.
Tires—36 by 4 all around.
Transmission—Selective type, three speeds forward and reverse. Ratchet device makes gear stripping impossible.
Wheel base—112 inches. Tread—56 inches.
Body—Touring car for five or seven, or toy Tonneau, $3,000. Runabout or Hiker type, $2,900.
The Hiker type consists of two bucket seats with large gasoline tank on rear. Equipment includes Prest-O-Lite tank, baggage rack and tire holders.

The Truth About the Reduction in Tires

Some tire manufacturers, working in collusion, tell you that they are able to reduce the prices of their tires owing to a reduction in the cost of crude rubber.

It is a peculiar fact, however, that **other rubber goods** manufactured by these same firms **have not changed in price** for years.

Another of their arguments is "Increased Capacity"—and right here it may be interesting to note the prices of these concerns on September 1st., 1906, as compared with the present figures:

	Sept. 1, 1906.	Sept. 1. 1908.
28 x 3 in. tire complete	$34.32	$17.55
30 x 3½ in. tire complete	48.39	27.25
32 x 4 in. tire complete	60.00	38.80
32 x 4½ in. tire complete	73.35	49.20

Do you think increased capacity should make this difference? No!

Could the reduction be brought about through a reduction in the price of crude rubber? Yes. **But has rubber really been reduced?**

Crude Fine Up-River Para Rubber is at least **20 per cent. higher to-day than it has been any time for the past twelve months.** PECULIAR CONTRADICTION, isn't it? NOW FOR THE FACTS.

On August 12th, 1908, we refused to accept the proposition advanced by our competitors, to **muzzle free competition** in the tire trade by agreeing to adhere to a uniform discount—a scheme by which they attempted to recover from **dealers** and **consumers** and **losses entailed** by the conduct of their business in other quarters.

We were opposed to the Tire Pool; it was **we who fought** it and saw it "BUST" on September 1st, 1906, and we are still **opposed to every kind of tire combination.**

This short statement tells the TRUE story and the TRUE PURPOSE of the recent price reduction, which is to

Drive Out Competition

—Ajax competition we might add.

At the present prices of raw material neither the product of our competitors nor Ajax tires can be sold at the profit that is **legitimately** due the manufacturer. But in offering our own tires at correspondingly reduced prices we simply fight back with the **pocketbook argument.**

As far as our competitors are concerned, we warn the tire using public to

Look Out for the Cut In Quality

that usually accompanies the cut in price.

AJAX TIRES

ARE GUARANTEED FOR 5,000 MILES

A certificate signed by the President of our Company, and bearing the number of the tire, accompanies **every tire** sold, and on the back of the certificate is a table of adjustments by which every user of Ajax tires can compute the charge should a replacement be necessary.

There is no better recommendation for a tire than our 5,000 mile guarantee, because it puts the burden of proof upon us and we MAKE GOOD.

Mongrel or Thoroughbred?

NOW IS THE TIME for you, Mr. Thoughtful Dealer, to decide what you will sell in 1909.

WILL IT BE A MONGREL? a car assembled from parts carried together from all over the country and hammered into shape as well as may be?

OR WILL YOU SELL THE THOROUGHBRED—a homogeneous mechanical masterpiece, every single part of which is the result of the same genius that devised the whole?

"ASTOUNDING," "MARVELOUS," "WONDERFUL," are the terms with which some assembled cars are now tagged, though they are astounding, marvelous and wonderful only to the assemblers, who like Rip Van Winkle, have been dozing in the growing woods of automobiledom and who now, bewildered by the progress that has been going on, seize upon time-tried and long-established practices and herald their adoption by the assemblers as brand-new discoveries.

LET'S REASON IT OUT: On the one hand you have the assembled car, with an engine bought from one manufacturer, a frame from another, and a transmission from a third, and so on down to the last rivet. The maker of the engine, the mill in which the frames are pressed, the transmission man, all derive their separate profits, leaving no other way to the assemblers to obtain their rewards than by skimping the quality of their "product."

AND THEY DO IT—THEY MUST! When you examine some of these astounding cars you will be truly astounded on finding that the four-cylinder engine is cast in one piece and has only two main bearings, whereas the Maxwell has four cylinders and five main bearings. You know well enough that making a motor with only two bearings is equal to leaving the engine to its own devices as far as alignment is concerned.

IT WILL BE A TOUGH JOB FOR THE DEALER to convince the purchaser who is wise that some four-cylinder engines of small dimensions will develop as high as 30 horsepower—because they can't.

MAXWELLS ARE A HOME-GROWN AMERICAN PRODUCT. The use of Maxwell features in Maxwell cars was neither a heaven-given inspiration nor the aping of foreign design, but the outcome of sound engineering sense.

WHEN 10,116 MAXWELL OWNERS testify to the excellence of their cars, all of which have been sold by Maxwell dealers, then the Maxwell proposition is one that you can't afford to pass by.

BEFORE HITCHING YOUR WAGON TO A STAR it will be wise for you to find out all about a dealership for Maxwells, the success of which is past and present, instead of lying in the dark and distant future that has swallowed so many wonderful cars that have been marvelous chiefly in their complete and rapid disappearance from the field of legitimate competition.

Benj. Briscoe

Always On the Job.

Is It Always On the Job?

This is the only truly satisfactory test of a reliable speedometer. **Stewart Speedometers** are famous for being **"always on the job."** You can put them on your car and forget them, so far as attention is concerned, as **THEY WILL OUTWEAR THE CAR.**

One of our Cleveland customers writes as follows:

I have had one of your Speedometers on my car for the past two years AND FIND IT PERFECT. Before purchasing a Stewart I had a ..... indicator which went to the bad. Then I tried a ..... It was no time before the flexible shaft went to the bad. They put on another shaft which did no better.

I Then Got a Stewart

The Odometer today shows 35,462 miles and I have never touched it

WHEN YOU EQUIP YOUR CAR WITH A STEWART SPEEDOMETER YOU CAN FORGET YOUR SPEEDOMETER TROUBLES. "They are always on the job." That's why we can GUARANTEE them for five years. All models equipped with the famous Stewart flexible shaft and patented swivel joint, at $40, $25 and $15. Send for catalog.

THE SELDEN CAR FOR 1909

Enters upon its second year with a clean record. No "first year" car has ever earned a better reputation or made a better showing.

THE CAR OF MODERATE PRICE

$ 2 0 0 0

Touring Car **Roadster**
Limousine **Landaulet**

4 cylinder, 28-30 horsepower, shaft drive, selective transmission, metal body, pressed steel frame, excellent hill climber, fine finish and style, roomy tonneau, luxurious upholstery, easy riding, smooth running, economical in up-keep, in fact, a high grade car in every particular.

The "Silent Selden"

1909 MODELS READY IN SEPTEMBER

Agency propositions now ready. Send for catalog and specifications.

Selden Motor Vehicle Co.

ROCHESTER, N. Y.

Member A. L. A. M.

Matheson

1909

Prices Reduced $1,000

And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for the best.

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still maintain the unequalled quality of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by doubling the factory output and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital has been increased by $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, at the makers' former prices to the agent or dealer; namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5,500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

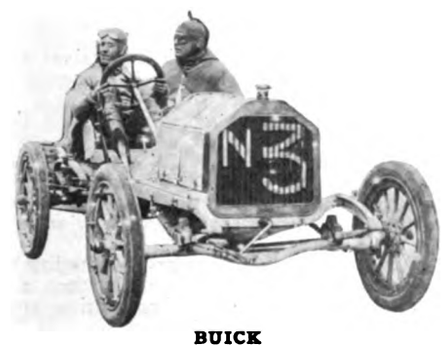
Auto-Meter Wins Again



Once More Shows its Right to "First Place." In the Motor Park Way Sweepstakes the Auto-Meter assisted these winners in their respective classes.

ISOTTA

CHALMERS-DETROIT

BUICK

ALLEN-KINGSTON

Nassau Sweepstakes—Buick. Driven by Hugh Easter.

Jericho Sweepstakes—Chalmers-Detroit. Driven by W. R. Burns.

Motor Parkway Sweepstakes—Isotta. Driven by Herbert Lytle.

First; Meadow Brook Sweepstakes—Allen Kington. Driven by H. Hughes.

Second; Meadow Brook Sweepstakes—Rainier. Driven by L. A. Disbrow.

NOTE WHAT MR. DISBROW SAYS:

"I want to express my sincere appreciation of the wonderful accuracy and reliability of the Warner Auto-Meter, with which my Rainier car M 32, an entrant in the recent Meadowbrook Sweepstakes, was equipped. The car finished second, two minutes behind the winner, the distance, 211 miles over the Vanderbilt Cup Course, averaging 52½ miles per hour.

"I am enclosing the time by laps, and I wish you to note that the variations that for the nine laps is hardly a variation of one minute between them. Such consistent running would have been almost impossible without the assistance of your instrument. Its accuracy was simply wonderful, and I can assure you that the next race I drive my car will certainly be equipped with a Warner, as I consider it the most reliable and accurate instrument manufactured.

"Wishing you all the success you most certainly deserve, I am, sincerely yours,

"(Signed) LOUIS A. DISBROW."

PROOF OF AUTO-METERS SUPREMACY:

The man behind the wheel is the man who knows—take his word for it!

Think of the accuracy of the Auto-Meter in time for each lap—hardly a variation of a minute between them.

For reliability and accuracy the Auto-Meter has no rival; its record is never disputed now—the standard time and speed guage by which others are judged.

It is known throughout our motordom because absolutely dependable. The best cars everywhere are equipped with Auto-Meters because the Auto-Meter record is infallible. Not "nearly"; no guess work, but to the fraction of a minute or the fraction of a mile it is exact.

Write for more details and arrange for a trial of the Auto-Meter.

DOES THE PUBLIC KNOW?

A Frank Talk Between Two in the Trade

A COMPETITOR SAID TO US the other day—he's one of the biggest manufacturers in the business and feels keenly the force of E-M-F. "30" success—"It's simply marvelous that you fellows can sell Blue Sky—'a car on paper'—as you do! Why, it's incredible—or would be if I didn't know from my own travels and observations that it's a fact.

"THE E-M-F. '30' IS THE RAGE EVERYWHERE—the buying public has simply gone foolish over it. In a dozen cities it is already at a premium—and not a dealer has a demonstrator yet, nor will have for ten days. We find it almost impossible to sell our stuff—those who havn't ordered E-M-F. Cars insist on waiting till they see it!"

THIS WAS A CANDID STATEMENT by one man in the trade to another. So we enlightened him—not too gently, perhaps, but frankly—telling him facts he knew in his heart to be incontrovertible. "You know and we know the E-M-F. '30' is the best value in an automobile the world has yet produced—that's the real reason."

"BUT OUR CAR HAS A REPUTATION," he said. "For what?" we asked. He didn't reply—for this was a candid conversation between two men in the trade. So we continued: "You tried to sell the same car last season for $2,000—and couldn't. This year you cut the price to $1,400 and sold a few—then the E-M-F. '30' was announced. The worst you can say about your this year's model is that it is like its predecessor."

"BUT THE PUBLIC DOESN'T KNOW what you and I in the trade know," he protested. "That's just where you miss the mark," we said; "the public—the automobile buying public—does know. They know the reputation of the men behind the E-M-F. Car, and the more they know of that the more eager they are for the car." Does not the public know—

SAY THAT HERRESHOFF WILL DESIGN A YACHT—the world will wager ten to one it will win the Cup. Say that Belasco will write a play—the ticket speculators will get busy. Say that Kipling will write a poem—the output of the print-shop will be contracted for before the first stanza is penned. The public does know!

SAY THAT "WILL" KELLY WILL DESIGN A MOTOR—the Automobile world will wager it will develop more power than any other combination of cast iron and aluminum any other engineer can design—and Kelly designed the E-M-F. "30." "But Kelly hasn't always—" "No; Kelly hasn't always had a Flanders to complete his work"—that's the answer.

SAY THAT FLANDERS WILL MANUFACTURE A CAR from Kelly's designs—every other manufacturer will brace himself for the contest of his life—they know their master.

SAY THAT EVERITT WILL FASHION THE GOWN—make the body—for Kelly's chassis; that's equivalent to saying the coach-work, the outward appearance, will be in keeping with the mechanical excellence of the car.

SAY THAT METZGER WILL MARKET THE OUTPUT—that guarantees every car will "stay sold"—if the Golden Rule in practice stands for anything.

THE PUBLIC DOES KNOW. That's a fact so firmly believed by the men who make the E-M-F. "30" car, every detail of design, every piece of metal that enters into the construction; every plank in the sales policy; is designed to withstand the bright light of day—the closest scrutiny of judicious buyers—the sharpest probes of envious rivals.

DO WE SELL BLUE SKY?—then did the Cunard Steamship Co. purchase a large chunk of that same commodity when, a few years ago, it contracted to pay fourteen or fifteen million dollars for two steamships of which not a trace was yet on paper—of which the only tangible thing was the reputation, the experience, the organization and the facilities—not to say mechanical and commercial integrity—of the men who contracted to deliver the goods.

A FELLOW BY THE NAME OF FROUDE—with the assistance of some other engineers and draughtsmen such as Kelly has—made the drawings and specifications. He didn't show the Cunard Company a blue print—didn't even agree to give the directors a demonstration. He said the two boats—which, by the way, were to be made in two separate yards by two companies, one at Clydesbank, in Scotland, the other at Wallsend-on-Tyne—would be bigger; carry more passengers more comfortably; and cross the Atlantic quicker than any other boats ever built. And the Cunard Company bit.

FROUDE TOLD THE CUNARD COMPANY that the empty hulls would draw 21 feet, 6 inches of water (figures may not be exact, but that's a detail). With engines in they'd draw 29 feet 4½ inches; and with maximum freight and passenger load, 37 feet 6 inches. He gave them the other specifications and told them to 'go ahead with the catalog.'

FROUDE BUILT THE BOATS; he painted them while on the ways; and he divided the colors, the blue and the red, at a point where he said the water-line ought to be. And lo! when they slipped from the ways and settled in the water, the blue of the boats just melted into the blue of the ocean at the point where Froude had said. Wonderful? —not at all—just knowing.

DID THE CUNARD COMPANY DOUBT at first that Froude and his associates would make good? Here's what they did:—called in the advertising manager and told him that three years from next September seventh a boat by name Lusitania would sail from Southampton for New York and on November sixteenth following another, Mauritania, would sail—and he'd better be getting busy on a new time-table.

Digitized by Google

THE REST IS HISTORY; the two boats did sail—they did break all records; and to show you the Public does know, every state-room was booked months in advance by live ones who wanted to be in at the record making—same kind of people who have bought more than half the output of E-M-F. "30" Cars before the first one was shipped.

NO! THIS IS NOT A STEAMSHIP AD—it's an E-M-F. "30" Ad. We just want to tell you that automobile designing and manufacturing by men such as those who have agreed to deliver E-M-F. cars is just as much a science—is just as devoid of elements of guess and chance—as is steamship building from Froude's designs, by the big yards of England and Scotland.

THE ENTIRE 1909 OUTPUT OF E-M-F. "30's" IS SOLD—every car alloted to our various distributing agents, sub-dealers, and the Studebaker Automobile Company.

STUDEBAKERS BOUGHT 6,000 CARS—and the deal was closed before the drawings were complete. The Studebaker Company thereby backed the reputation of our own organization with its splendid reputation.

BUT WE ARE NOT HALF SO PROUD of the fact that 12,000 cars have been contracted for by dealers as we are of that other more startling fact that thousands of cars—fully half the allotment of every dealer—have been sold to individual users—$100 cash deposit paid and delivery date fixed for each car.

SAN FRANCISCO HAS SOLD 835 CARS—and the latest report is several days old. A man who has an order in there for an E-M-F. "30" Car, with delivery date any time in March can readily sell his place in line for $100. January deliveries are worth $200; and offers of $300 for December options go a'begging at the price.

PHILADELPHIA IS CALLED A CONSERVATIVE TOWN. It is conservative—it's the best E-M-F. town on the map. Foss-Hughes Company have sold over 125 of their allotment of 250 cars and are adding to the number at the rate of five a day.

BLASE BROADWAY—BROADWAY THE WISE—has simply gone into ecstacies over the E-M-F. "30." Herman Koehler, who has sold more automobiles in the last five years than any other retail dealer in the world, says he never saw the like before. Man came in the other day and said, "But I want to get one at once—next week anyhow." Koehler smiled; "just down the street a block—another place in the second block—you can get all you want. They have 'em in stock there—likely to keep them, too." Man tried to push his way out thru the crowd—couldn't.. Then it occurred to him why the crowd was there, and he gave Koehler an order for "earliest delivery you can make."

GITHENS BROTHERS OF CHICAGO—most conservative dealers on the Row they say—had sold 118 cars up to last Wednesday—rate they were going then Chicago will have overtaken Philadelphia by now. Walter Githens writes, "If our demonstrator doesn't arrive November 15th as scheduled we won't need it—we'll be sold out."

BOSTON—STUDEBAKER BRANCH—REPORTS: "We sell an E-M-F. "30" every hour on the average. That's going some. Boston won't need more than an eight-hour day to dispose of its allotment in short order at that rate. But Boston is naturally an E-M-F. town—always was strong on pedigrees, and down there they call the E-M-F "30" the Blue Blooded Car."

MINNEAPOLIS BOUGHT 400 with an option on 100 more "till New York Show Time." Sold out in 60 days. Took up the option a month ago and has sent three emissaries to Detroit the last week in efforts to persuade us Minneapolis has been slighted—ought to have 1,000; willing to compromise on 500.

WE MIGHT NAME 500 DEALERS who are handling the E-M-F. "30"—it would be the same story. Have to look at the postmark to see which one is asking for more—letters all read as if dictated by the same person:—"Over half our allotment sold already and no demonstrator—what will we do when it comes; can't we have just a few more?"

PORTLAND, MAINE—AND PORTLAND, OREGON—the same story. Atlanta—and Albany. Buffalo, Empire State—and Boone in the Corn Belt—E-M-F. "30" has the call—all others waiting till we have sold out." San Antonio—and Syracuse—ditto. Xenia and Youngstown and Zanesville all asking us to make 12,000 cars spread over a 25,000-car demand.

ARE WE SELLING BLUE SKY?—If we are, then we're selling it with the best guarantee that ever went with an automobile—a guarantee of entire satisfaction or your money back when you see the car—and a guarantee of fair, liberal, generous treatment afterward.

THE ONLY MAN WHO TAKES A CHANCE is the man who doesn't get a place in the line-up near the front—an option on early delivery. He can get out any time—get a premium for his position if he is willing to accept a later delivery. And he can get any one of the several competing makes on the minute—they have them on the floor now and most of 'em will stay there. The public does know—and it knows no other organization can compete with this one—none can deliver a car of this quality at anywhere near the price of the E-M-F. "30."

THE LUSITANIA WILL SAIL ON TIME—and every E-M-F. "30" will be delivered according to schedule—the only thing that can delay your car will be that you let too many get ahead of you in the line. Want a specification sheet and an order blank? We'll mail them if you ask. It'll be a satisfaction to say you were on board when the world's record was broken.

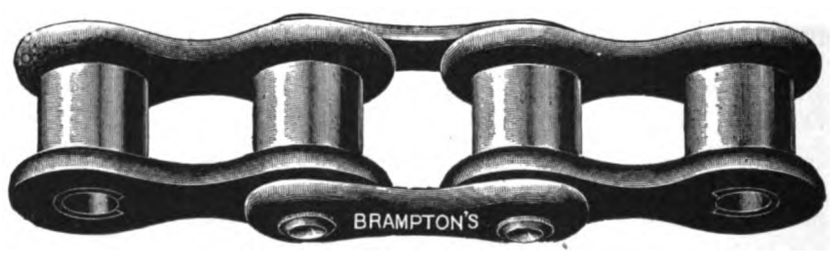
A CHALLENGE RACE~WON ON TIMKEN BEARINGS

AND FRONT AND REAR AXLES

These photographs show two examples of road conditions encountered by the York Motor Car Co.'s "Pullman" during its challenge race from Philadelphia to Savannah under the auspices of the Quaker City Motor Club. They say:

"The cars left Philadelphia March 5th, and covered a distance of 1,400 miles over such roads as photographs show you and which took them 14 days. In some places we could make only 10 miles a day. DURING ALL THIS TRIP WE NEVER RE-PLACED A BEARING OR HAD ANY TROUBLE WHATEVER WITH THE DRIVE SHAFTS. This car is still running and has possibly covered 10,000 to 12,000 miles. After the car was driven back to the factory without any work on it whatever, it made a trip from York to Philadelphia and New York and is still running in Newark, N. J. We were awarded the race, having covered the full course as laid out by the Q. C. M. C. WE CANNOT SAY TOO MUCH FOR THE TIMKEN ROLLER BEARING AXLE CO.'S PARTS."



A Statement of Fact—Not Advertising Buncombe.

Every Manufacturer, Dealer and Owner should have our illustrated books and other information on Auto Friction Bearings, for every movable part, Power Axles, Brakes, etc. Free on request.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides of the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement. THE BRAMPTON CHAIN is made of self-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material —self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMPTON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size. We have in stock chains to fit all American and foreign cars.

YOUR 1909 CAR

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.
Agents wanted in unoccupied territory. Catalog on request.

Locomobile

Establishes American Supremacy in Automobiles

Wins the Vanderbilt Cup

The Greatest International Road Race ever held in this country and the supreme test of reliability and endurance.

258 MILES IN 240 MINUTES

OVER A SLIPPERY COURSE

Locomobile No. 16 was first; Locomobile No. 1 would have finished in third place, but the race was called off after two cars had finished. At this unexpected announcement touring cars came out on the course, and as No. 1 Locomobile neared the Grand Stand on its last lap it came in collision with a car 25 YARDS FROM THE TAPE. The Cup Commission had notified the drivers before the race that five cars would be allowed to finish. Out of 19 entries, of which 7 were foreign cars, LOCOMOBILE RAN FIRST AND THIRD. Two cars placed. Something heretofore unknown in any contest for the Vanderbilt Cup. No trouble of any sort was experienced on either of the two cars except from the tires, which were of the anti-skid variety, necessitated by the slippery course.

Made the Fastest Lap

The Locomobile No. 16, driven by Robertson, made the fastest lap—23 45-100 miles—in 20 minutes and 17 seconds. It also ran 5 other laps in less than 21 minutes each. ITS AVERAGE SPEED DURING THE RACE WAS 64 3-10 MILES PER HOUR, INCLUDING ALL STOPS. THIS SMASHES ALL RECORDS FOR THE VANDERBILT CUP, no previous average reaching 62 miles per hour.

Both cars are of 90 h. p. and are substantially the same as our regular stock product, the difference being one of dimensions, so that the victory stands as a splendid triumph for Locomobile design and construction—a triumph for the Locomobile low-tension ignition system, the Locomobile magneto, the 4-cylinder motor, the selective transmission system and other features of the car. The material used in our regular product is everywhere as good and in some places even better than that used in the cars entered in the race AND WHICH WERE BUILT IN 1906.

The consistent performance of the two Vanderbilt Cup Locomobiles is but a repetition of the performance of the two entries in the great Founders' Week Stock Car Race in Philadelphia, October 10. This great race was won by a 40 h. p., 4-cylinder Locomobile, regular in every way.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, November 5, 1908. No. 6

MERGER RUMORS BRING DENIALS

Story of Combine, Backed by Morgan, Fails of Verification—Buick to Make Chassis for Olds.

Persistent but conflicting rumors of mergers involving the names of the Buick, Maxwell-Briscoe, Oldsmobile, Everitt-Metzger-Flanders, Cartercar and Pope-Toledo interests had a further stirring up last week by the publication of dispatches from Detroit, Mich., announcing the practical completion of an automobile combine by J. Pierpont Morgan, in which all the concerns mentioned were to be included. With much circumstantial account, the name of the consolidation was given as the General Motors Co., and its capitalization of $12,000,000.

Previous announcement of the proposed formation of the International Motor Co., to include the Maxwell-Briscoe, Buick and other interests and which was to have the support of Morgan's sons-in-law, while having no subsequent confirmation, prepared the way for the later rumor.

Negotiations looking to an arrangement between the Maxwell-Briscoe and the Buick companies are known to have been in progress for some little time, but a combination between them is not looked for at present. Whatever merger plans the Buick company may entertain just now appear to be in connection with the Olds Motor Works, at Lansing, Mich. It is known that for the coming year the relations between the companies will be so close as to include the making of the chassis for the Olds $1,200 model at the Buick factory. The presence of several mysterious visitors at the Olds plant, and the fact that the company has taken this time to close its books and take inventory instead of in December, as usual, has lent support to the idea that a sale or consolidation is likely, but two weeks ago F. L. Smith the president of the company, upon being consulted over the long distance phone by the Motor World, asserted that there was nothing for him to deny concerning a consolidation because nothing of the sort was in prospect.

In an endeavor to learn at first hand from the parties interested, their relations to the rumored merger, and to put each of them on record, the Motor World yesterday sent to each the following telegram:

"Any truth in Detroit news dispatches concerning your connection with General Motors or International Motor mergers? Please wire reply quick."

Replies had been received from three out of the five companies, at the time this issue went to press, as follows:

The Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., replied: "No information here of any merger."

The Cartercar Co., of Pontiac, Mich., wired: "No. Reports without foundation."

The Everitt-Metzger-Flanders Co., of Detroit, Mich., answered: "Please say Everitt-Metzger-Flanders Co. has no connection whatever with General Motors or International Motor mergers."

Only the Olds Motor Works and the Buick Motor Co. failed to avail themselves of the opportunity to affirm or deny delations or prospects.

To Sell Hagerstown and Elyria Plants.

Offers have been made to the receivers of the Pope Mfg. Co., of Hartford, Conn., for two of the company's plants. For the Hagerstown (Md.) factory a bid satisfactory to the receivers has been tendered by the Montrose Metal Casket Works, of Philadelphia, and a court order will be asked permitting its acceptance. Negotiations are also in progress for the sale of the Garford saddle plant at Elyria, O.

Kesser is Hartford Sales Manager.

Franklin Kesser, formerly of the Philadelphia branch of the Hartford Rubber Works Co., has been appointed sales manager at the Hartford office. While having general direction of the sales campaign, his work will be under the direct supervision of the officers of the company.

RAINIER IN RECEIVER'S HANDS

Saginaw Factory Attached by Sheriff—Bankruptcy Proceedings Filed by Three of the Creditors.

Following a number of suits brought by creditors, a petition in bankruptcy was filed on Wednesday against the Rainier Motor Car Co., with salesrooms at Broadway and Fifty-sixth street, New York City, and factory at Saginaw, Mich. The liabilities are estimated at $200,000, of which $50,000 is secured. The factory at Saginaw has been attached by the sheriff, on a claim of the Auto Crank Shaft Co., and business there is entirely suspended.

The petitioning creditors are Pembroke C. Chrysler, $468 for commissions; J. J. Higgins, $549 for commissions; and the Hartford Suspension Co., $262 for merchandise, represented by Griggs, Baldwin & Pierce, attorneys. Judge Hough, of the United States District Court, has appointed Jesse Watson receiver.

John T. Rainier, president and treasurer of the company, previous to forming the present organization, was particularly successful in marketing a "Rainier" model made to his order by the Garford Co., of Elyria, O., the car enjoying great popularity in New York City at a very profitable retail price. Last year, however, the new company was formed to manufacture Rainier cars. It was incorporated March 7, 1907, under New York laws, with $1,000,000 capital, of which $800,000 is common stock and $200,000 preferred. Accepting a bonus and factory site offer from Saginaw, Mich., the company commenced making its own cars there.

George Carlton Comstock, attorney for the company, asserts that the concern is solvent, is only temporarily embarrassed and expects to come out all right if given a little time. He declares the normal assets to be larger than the liabilities and that the real assets are at least $200,000.

In the Retail World.

A. Koyen and William Burtz have rented the Rees concrete building on Fifth street, Tremont, Neb., where a garage and a bicycle repair shop will be conducted separately. Koyen will manage the automobile department.

The Belmore, MacDougall, Moores Co., of Portland, Ore., has moved from Sixteenth and Alder streets to the corner of Seventeenth and Alder. The new garage has three floors and is much larger than the old one.

The ownership of the Central Garage, of Buffalo, N. Y., has changed. The establishment, which is located at 22-24 West Utica street and which was formerly known as the Utica Auto Station, has been bought by J. G. Lewis, and D. L. Walker.

The Jaynes Auto Supply Co., of Buffalo, N. Y., has expanded to "international" importance. W. C. Jaynes, the proprietor, has opened company branches at 19 Alice street, Toronto, Ontario, and 561 Main street, East, Rochester, N. Y.

Charles E. Miller, 1829 Euclid avenue, Cleveland, O., has been appointed a distributor for Continental tires. He will supply both the tires and demountable rims of the Continental Caoutchouc Co., of New York, at the prices obtainable at the home office.

The Consumers Auto Supply Co., Seventh avenue and Smithfield street, Pitsburg, Pa., has taken the agency for Empire tires, made by the Empire Automobile Tire Co., of Trenton, N. J. The arrangement is expected greatly to increase the demand for Empires in western Pennsylvania.

Chase & Ludington, agents in San Diego, Cal., for the Rambler, proclaim their new garage, on Second street near A street, as the finest structure of the kind in Southern California. The building is of concrete, and contains salesrooms, offices, storage floors and a well equipped repair department.

The Ellicott Garage, 988 Ellicott street, Buffalo, N. Y., in addition to general repairing and remodeling of cars, has branched out to build bodies. This branch of the business will be known as the Ellicott Body Co., and a two story brick building has been built, in which suitable machinery is now being installed.

Woods R. Woolwine and Charles S. Anthony have formed a partnership in Los Angeles, Cal., under the name of the Big Four Automobile Co. At present the company is located at 112 East Ninth street, but will later move to a building which is being planned for a site on Olive street, between Twelfth and Thirteenth streets.

The Berrodin Rubber Co., of Philadelphia and Buffalo, has been incorporated under a state charter, and under the reorganization has elected the following officers: Willard A. McCalla, president; Martin E. Brigham, vice-president; Henry K. Buck, secretary, and Frank Berrodin, treasurer and general manager. The management of the Buffalo branch has been given to William Q. Cramp.

Davis Takes Garford and Studebaker.

A. R. Davis has been placed in charge of the Metropolitan Motor Car Co., in Cleveland, O., which has been taken over for the sale of Garford, Studebaker and E-M-F. cars. Joseph D. Porter, formerly New York manager of the Wayne and latterly a traveler for the Everitt-Metzger-Flanders Co., has been engaged to take charge of the state territory on these cars. The Metropolitan Company's salesroom and garage is on East Nineteenth street, near Euclid avenue. Several changes will be made in the building to provide offices for the Garford staff and to afford larger show space.

Kiblinger Establishing Branches.

Four cylinder motor buggies are promised among the new models of the W. H. Kiblinger Co., of Auburn, Ind. To take care of increased business the company has opened branch offices in New York City and Kansas City, and in Orillia, Ont. The Canadian office will be known as the Tudhope-McIntyre Co., with a sub-office at Calgary, Alta. The eastern office, at 256 Broadway, New York City, will be under the management of H. H. Woodrough. At Kansas City, James H. Griffith, formerly of the Studebaker company, will be in charge.

Miller to Manage New York Goodrich.

H. C. Miller, general traveling representative for the B. F. Goodrich Co., of Akron, O., and one of the best known tire men in the country, has been appointed general manager of the B. F. Goodrich Co., of New York. He assumed his new duties this week.

Brock Again to Leave Autocar.

Marcus I. Brock, who after leaving the Association of Licensed Automobile Manufacturers, returned to the Autocar Co., of Ardmore, Pa., as its sales manager, has resigned. His resignation takes effect November 30.

To Handle Twentieth Centuries.

The selling agency for the lamps and generators made by the 20th Century Mfg. Co., has been given to the Stevens-Britton-Maurel Co., of 1783 Broadway, New York City. The latter firm will handle the business with automobile makers and importers.

Benjamin Back in Syracuse.

C. Arthur Benjamin, formerly with the H. H. Franklin Mfg. Co., and later with the Aerocar Co., has returned to Syracuse, N. Y., to go into business for himself. He has taken the agency for the E-M-F. and Packard cars.

The Week's Incorporations.

Chicago, Ill.—Automobile Supply Co., under Illinois laws. Increase of capital from $15,000 to $25,000.

Chicago, Ill.—Universal Wind Shield Co., under Illinois laws, with $10,000 capital. Corporators—M. J. Moran, George Remus, and Charles Lynch, Jr.

Chicago, Ill.—C. A. Coey Automobile Co., under Illinois laws, with $75,000 capital. Corporators—C. A. Coey, D. MacVichie and B. Levering.

Chicago, Ill.—Ford Automobile Equipment Co., under Illinois laws, with $2,400 capital. Corporators—Edwin Ford, Phillip Steele, and Edward Gale.

Portland, Me.—Safety Tire Co., under Maine laws, with $2,000,000 capital; to manufacture rubber tires. Corporators—C. E. Eaton, president; T. L. Croteau, treasurer.

Greensboro, N. C.—American Motor Car Co., of Greensboro, under North Carolina laws, with $25,000 capital. Corporators—H. L. Hopkins, L. B. Hopkins, and Thomas S. Beale.

Rochester, N. Y.—Omar Motor Car Co., under New York laws, with $50,000 capital; to manufacture juvenile automobiles. Corporators—S. H. Mora, W. W. Hibbard, and F. L. Sibley.

Pittsburg, Pa.—Co-Operative Automobile Co., under Delaware laws, with $25,000 capital; to manufacture and deal in automobiles. Corporators—L. E. Negley, J. P. Vance and A. C. Martin.

Hudson, N. J.—Maxwell-Briscoe-Cleveland Co., under New Jersey laws, with $25,000 capital; to manufacture automobiles and parts. Corporators—H. O. Coughlan, L. H. Guenther and John R. Turner.

New York City, N. Y.—Shepherd Motorcar Co., under New York laws, with $20,000 capital. Corporators—Irving R. Shepherd, Joseph A. Shepherd, and Fannie R. Shepherd, 106 Penn avenue, Brooklyn.

Cincinnati, O.—Herschede Motor Car Co., under Ohio laws, with $50,000 capital; to deal in automobiles. Corporators—L. B. Herschede, Joseph Linn, W. J. Herschede, Thomas Kelly, and A. T. Herschede.

New York City, N. Y.—Kayton Taxicar & Garage Co., under New York laws, with $100,000 capital. Corporators—Edgar M. Leaventritt, John F. Jacobs, and Walter F. Tracy, 111 Broadway, New York City.

New York City, N. Y.—Excelsior Storage Battery Co., under New York laws, with $10,000 capital. Corporators—Philip Horowitz, 35 West 115th street, Bela Robins and Aaron A. Feinberg, 150 Nassau street, New York City.

New York City, N. Y.—Rapid Motor Transportation & Maintenance Co., under New York laws, with $50,000 capital; manufacturing, garage and express business. Corporators—H. C. Hunter, 30 Church street; M. S. Couch, 81 West street, New York City; W. B. Banker, Passaic, N. J.

SEPTEMBER EXPORTS SHOW GAINS

British North America Makes a Big Jump—Increases for the Month in Seven Geographical Divisions.

Marked improvement of the export movement of American motor cars and parts took place in September, the total for the month being $277,917 as compared with $211,873 for the corresponding month last year. The greatest increase took place in the trade with British North America, the total being $131,278 as against $50,250 a year ago. The United Kingdom purchased to the amount of $50,015 during the month as against $39,321, and Other Europe bought $22,924 as against its previous September record of $9,816. To offset these gains to some extent, losses are shown in Mexico, South America, British Australasia and Africa.

The September gain, however, was not sufficient to do more than to reduce the decline for that part of the fiscal year which has passed. For the nine months ending with September, the total is $4,282,728, as against $4,963,885 for the corresponding period of 1907. No small part of the total decline is ascribable to a temporary dullness in the trade with British North America, although the greatest drop of all for the period is that of Mexico, from $512,682 last year to $218,670. British Australasia likewise shows a continued falling off, making the total for the nine months $59,380, as against $154,496 for the same period last year. Gains are shown in the totals for the United Kingdom and for Other Asia and Oceania, as well as in the group given as Other Countries. The remaining divisions are close to the figures for last year, with slight losses prevailing.

While in the nine months' total only four of the fourteen divisions record gains, the showing for the month of September itself discloses gains in seven of the divisions.

The record in detail follows:

	September		Nine Months Ending September		
	1907	1908	1906	1907	1908
Automobiles and parts of	.....	.....	*$2,356,110	.....	.....
Automobiles	$179,041	$235,607	†1,178,187	$4,442,478	$3,805,569

† Figures are for July to September, 1906, inclusive.

German Grotto at Palace Show.

Detail plans for the "Great White Show" which the American Motor Car Manufacturers' Automobile will disclose to the public on New Year's Eve at the Grand Central Palace, New York City, now provide for a German grotto concealed behind a stone wall effect. A Swiss chef, who can cook in all the chief Continental languages, has been engaged, while quaint paintings and mottos from famous rathskellars and wine cellars of Germany, together with roof decorations of grape clusters and vines, will suggest the further possibilities and inviting characteristics of the retreat.

Diamond Organizes a Racing Department.

In organizing a full-fledged racing department, the Diamond Rubber Co., of Akron, O., has secured Joe Tracy as its chief, who will also act as consulting engineer on all racing equipment matters. As a driver in Vanderbilt and foreign speed contests Tracy brings a large experience to bear, and it is anticipated that with the Diamond demountable rims, the new Diamond Grip and anti-skidding tires and an organization that can take care of racing matters on a large scale, the company will be well equipped to accumulate racing honors.

Preston Buys Factory in Buffalo.

The Preston Fabric Tire Co., of Buffalo, N. Y., which was recently incorporated to manufacture automobile and bicycle tires, has bought the property of the old King Spring Co., at the corner of Niagara and West Delavan avenues. The factory building is being remodeled for the Preston company's needs.

Kee-Lox to Build Automobiles.

Enjoying considerable prominence in the typewriter field, the Kee-Lox Mfg. Co., of Rochester, N. Y., is branching into the manufacture of automobiles. Specifications for its materials are already being put in shape.

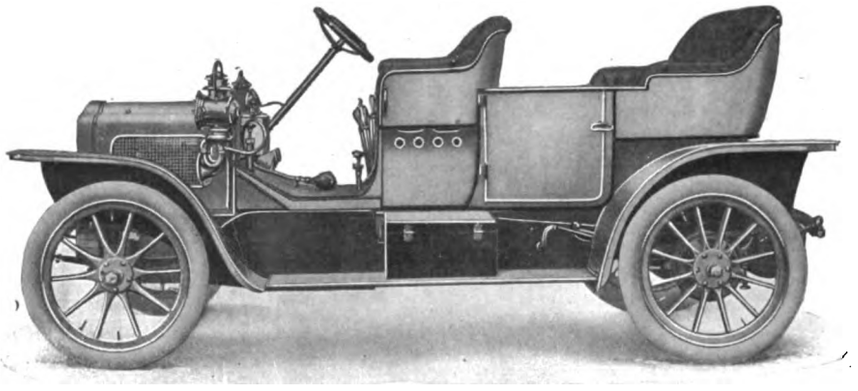
ROYALTIES GO TO THE CREDITORS

Electric Vehicle's Income on Selden Patent Set Aside for Their Benefit—Bondholders do Not Share It.

That the general creditors and not the bond holders of the Electric Vehicle Co., of Hartford, Conn., are entitled to that company's income from royalties under the Selden patent was indicated last week when an order was passed by Judge M. A. Shumway, of the superior court at Hartford, directing the receivers to transfer $90,000 from the American National Bank at Hartford to the Chase National Bank of New York City. The money is the whole of the company's share in Selden royalties paid for the year ending last September. In being transferred to New York it is deposited to the credit of Halsey M. Barrett and Henry W. Nuckols, in their capacity as receivers in New Jersey, to be held subject to the order of the United States circuit court for the district of New Jersey for the equal benefit of creditors of the company residing in any jurisdiction.

Under the new agreement with the Selden licensees last spring the total income of the Electric Vehicle Co. from Selden royalties is limited to $150,000 per annum, of which a maximum of $60,000 per annum goes to George B. Selden himself, leaving a net balance of $90,000 to the company. Although entered into in the spring, the agreement was post-dated as of effect from the first of the fiscal year, commencing October 1, 1907, so that the $90,000 which has been ordered set aside for the general creditors represents the company's net income from the Selden patent for the year.

Studebaker Begins Absorption of Garford.



The first definite move in the absorption of the Garford interests by the Studebaker Co., and which is confirmative of the Motor World's exclusive story of the deal, occurred this week when W. B. Hurlburt, C. R. Teaboldt, and S. J. Wise, the officers of the Garford Motor Car Co., of New York, accepted the handsome offer which had been made them and disposed of their holdings. The effects of the New York establishment have been transferred to the Studebaker branch. Hurlburt and his two colleagues already have settled on their future plans which will assure their continuance in the industry.

Lasher General Manager for Koehler.

W. J. Lasher, a veteran of the New York City trade, has resigned from the Oldsmobile Co., of New York, to become general manager for the H. J. Koehler Sporting Goods Co. The latter company has the control of the E-M-F. cars for New York City, New Jersey and neighboring territory.

A WHITE STEAMER FOR $2000

Not since 1904 have we made a car priced at so low a figure as $2,000. The White—"the car in a class by itself"—has thus been brought within the range of a larger number of purchasers than has been the case in recent years.

The new $2,000 White car, known as our Model "O," has none of the attributes of the "cheap machines." It is simply a "smaller edition" of our $4,000 car. The new model "O" is rated at 20 steam horsepower, which means that it can do the work of gasoline cars rated at much higher figures. The wheel-base is 104 inches; the tires, both front and rear, are 32x3½ inches. The car is regularly fitted with a straight-line five-passenger body. The frame is of heat-treated pressed steel. The front axle is a one-piece forging of I-beam cross section.

The nature of the steam engine is such that the engine of small power has all the desirable attributes of the engine of high power. In other words, as the weights of our small car and of our large car are proportionate to the power of their respective engines, the small car can do anything that our large car can do.

To summarize the features of our new Model "O" car—it is noiseless, odorless, smokeless and absolutely free from vibration. All speeds from zero to maximum are obtained by throttle control alone. The speed of the car responds instantly to the throttle; the engine can never be stalled. The directions for driving are summed up in the phrase, "Just open the throttle and steer." It starts from the seat—"no cranking." It is the ideal moderate priced machine. It is the best for the man who wishes to drive and take care of his own car. It is a result of our nine years of experience in building the White Steam Car—the only machine which finds a ready market in every portion of the globe.

Write for circular giving full details of this car.

NEW YORK, NOVEMBER 5, 1908.

Odd Feature of the Rural Market.

Considerable distinction has been earned by the "farmer" market because of its strengthening influence on the sales of motor cars during the past year or two, and evidences are not lacking that in the minds of many sales managers it is reckoned as of equal if not greater importance than that developed within the corporate limits of cities and towns. At the same time, it may have escaped notice that the farmer market as such lacks proper definition and classification. To the average metropolitan reader, particularly if of the East, the broad areas of the middle West are supposed to furnish the "big" demand of the present day, while the agencies and branches of the cities and towns are thought to cater to a more limited demand which is purely local. A brief consideration of the great volume of sales credited to the latter, however, must be sufficient to show that this idea must be at least in part erroneous. Were all the sales credited to the city agencies placed directly in the cities the number of machines in actual urban service would be much greater than actually is the case. As a matter of fact the amount of city business which is placed in the surrounding country is astonishingly large and incidentally constitutes a most embarrassing element of the work.

The truth of this was forced home this week by the assertion of a well-known New York dealer that from forty to sixty per cent. of the inquiries, both personal and by letter, received at his store were from out of town prospects. Without knowing the exact ratio of sale to inquiry between the local and foreign applicants, it is easy to see that this must constitute a source of no small annoyance to the dealer, as well as a cause of more or less fruitless effort. For the salesman who is working on a commission basis cannot well be expected to work up any great amount of enthusiasm over a prospect which if it materializes at all is likely to do so through the manufacturer's main office, or perhaps even through some local agent.

Psychologically, the condition is easily explained. The prospect living in the country naturally places a high value on the advantages of coming to the city where the greater competition of a large number of agencies is likely to insure more thorough and careful treatment of the customer than is to be expected in a town which boasts but one or two agencies. This, together with the opportunities of observing a large number of cars in actual use, makes the great city a sort of mecca for would-be buyers, many of whom come merely for purposes of study, afterward placing their orders with local dealers or with makers who ship direct. The city agency thus becomes a valuable instrument of general education and publicity almost as much as a selling organ in itself. In this respect it may have an intrinsic worth which cannot be measured in terms of actual business consummated.

The handling of inquiries of this nature requires the utmost tact and diplomacy. Out-of-town customers, even those who actually place their orders with the metropolitan institution, frequently live so far away as to be completely out of the reach of possible repair and accessory sales once they have been equipped, and therefore such sales as are closed among this class of customers, frequently carry no subsequent interest to the dealer. In consequence there is a strong temptation to skimp them, and to receive the rural visitor coldly as a not over-profitable potential customer.

Effects of Misdirected Enthusiasm.

Among the multitudinous reflections engendered by an event of as great magnitude as the Vanderbilt Cup contest a question arises as to the wisdom of permitting interest in it to transcend all other interests for the time being, even to the exclusion of routine business. For days and weeks in advance of a great contest of this nature a spirit of feverish expectancy broods over all establishments which are in any way connected with the affair, and even permeates to a deplorable extent many which have no interest in it other than as one of the big happenings of the sport and its parent industry. During the days immediately preceding the event plans and preparations for witnessing it, speculations as to the outcome, idle gossip and, in the local agencies and stores, "visiting" with out-of-town acquaintances are permitted to absorb a generous portion of the time which otherwise would be devoted to routine work. In its entirety a big race, a big show, a big carnival, goes a long way toward assisting the progress of the industry—that is beyond question. Examined in detail, it would seem that frequently a sort of school-boy spirit of holiday-making is permitted to encroach upon legitimate effort at such times in a way which is not only demoralizing but directly injurious.

To cite a local instance, which it is to be hoped was an exception to the general rule, it is related that an old and valued customer of one of the well-known metropolitan establishments, himself not at all interested in racing matters, visited the store on the day of the Vanderbilt race with the intention of purchasing one of the latest models of the widely advertised car. Instead of the courteous reception which he anticipated, he encountered only the clumsy attentions of an office boy, who was much disgruntled at having been selected for the ignominious position of "housekeeper" on the great day. Of the new model, he knew little or nothing, and as a result of the brief and unsatisfactory interview the customer decided to visit further along the "row" in search of better treatment. The outcome was the placing of a provisional order for a rival make of car, almost equally famous for its excellence. As the buyer already had owned two of the first-men-

Digitized by Google

tioneed machines and always had been a staunch ally of its makers, the loss brought about by an hysterical over-estimation of the importance of the big race, was more than that covered by the switching of something less than five thousand dollars worth of business to another concern.

Of course this is merely a convenient illustration of the effects of a condition which must have been very apparent to thinking men in the trade every time an event of more than passing interest has absorbed the attention of its people. It is debatable, perhaps, whether the wholesale renewal of interest resulting from such sweeping attacks of enthusiasm do not more than counteract losses resulting from incidents such as the one in point. At the same time it also is debatable whether the relaxation permitted at such times is of the sort likely to encourage enthusiasm of the earnest, fruitful sort, or whether it fosters merely the spirit of play and the spasmodic, jealous element of rivalry encouraged by competition which is purely sporting rather than commercial in its origin.

Location of the Gearset in Question.

"Standardization" and "refinement of detail," those mighty watch words of the press agent, have gone a long way toward removing the various sources of mechanical controversy over the points of motor car design which at one time made such valuable advertising matter. But it is to be noticed that as each ditch is crossed another presents itself, so to speak, so that as fast as one method of practice becomes accepted and is given an established value, other questions come up which have been introduced by it. The use of the method of transmission by means of the propeller shaft and floating or semi-floating axle for example, is fast gaining ground and the chain versus shaft drive controversy no longer exists as such, since the status of each type has been pretty well established. At the same time there has been developed the controversy of the two types of unit power plant and unit transmission, or axle mounted change gear, as it is variously described.

Primarily it appears more logical if the gearset is to be annexed to either the motor or axle groups, to place it in close relation to the motor rather than on the axle, and for a number of very good reasons. Thus, the motor being the more massive of the two units permits the gear shafts to be given a more rigid mounting than might seem possible otherwise, allows the elimination of universal joints or other self-aligning connections between the motor and the clutch or the clutch and the gearset, permits a compact and thorough system of lubrication to be established, and combines all the parts which are most liable to require adjustment or other attention in a position in which they are readily accessible, besides making the removal of the entire aggregation for purposes of overhauling or substitution, a comparatively simple matter. As objections to the system may be mentioned the increased load on the front wheels which results from crowding the gearbox forward, the concentration of this load on three points, usually well forward in the frame, and the necessity of careful construction in building the main bed and housing parts in such a way as to secure adequate strength without unduly increasing the weight.

Similarly it would appear on first sight that the unit transmission would suffer as a result of concentrating too much dead load on the axle. As a matter of fact, however, recent designs of this sort have been carried to such a high point of development that in one instance the rear axle of a thirty horsepower car turns out to be but 20 pounds heavier with the gearset than it was without it—the axle design remaining practically unchanged in other respects. Whatever the increase in axle dead weight may be, it has the effect of bringing about a more uniform distribution of weight on the wheels than otherwise would be possible, which of course, is of considerable advantage. Advantages accruing from the adoption of this system include the compact grouping of the gearing, the simplicity of the housing and the fact that both gearset and differential mechanism may be lubricated by a common oil bath; ease of inspecting, repairing or replacing the entire group when any difficulty exists; ease of interchanging the entire group, and accessibility—since it may be got at without interfering with the body or its load in any way.

Both systems fare alike in regard to ease of interchanging the complete units, and both are advantageous in respect to clearing the waist of the chassis of mechanism. In fact, the question appears to be whether it is better to separate the power plant between the clutch and the gears or between the gears and the differential. Actually, and with well thought out design, arguments as to weight distribution, durability of parts, simplicity of construction and economy of construction and upkeep remain to be worked out in a manner which will differentiate clearly between the two methods of arrangement. At the present time the unit power plant arrangement is in more common use than that of the unit transmission. Yet the latter system has among its strongest advocates so many cars of remarkably good reputation that the balance of advocacy is pretty nearly equal all things considered.

COMING EVENTS

November 6, St. Louis, Mo.—Manufacturers & Dealers Association's hill climb, Soloman's hill.

November 6-7-8, Detroit, Mich.—Detroit Automobile Dealers Association's three days endurance run.

November 7, Denver, Colo.—Denver Motor Club's economy test to Greeley, Colo., and return.

November 7-8, St. Louis. Mo.—Track meet, old fair grounds.

November 7-8, New Orleans, La.—New Orleans Automobile Club's two days race meet, State Fair grounds.

November 14, Philadelphia, Pa.—Quaker City Motor Club's race meet, Point Breeze track.

November 25, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

November 27, Denver, Col.—Colorado Industrial Exposition Association's race meet. Overland Park track.

December 31, Long Island Motor Parkway—Speed trials against time, auspices of the Long Island Motor Parkway, Inc.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

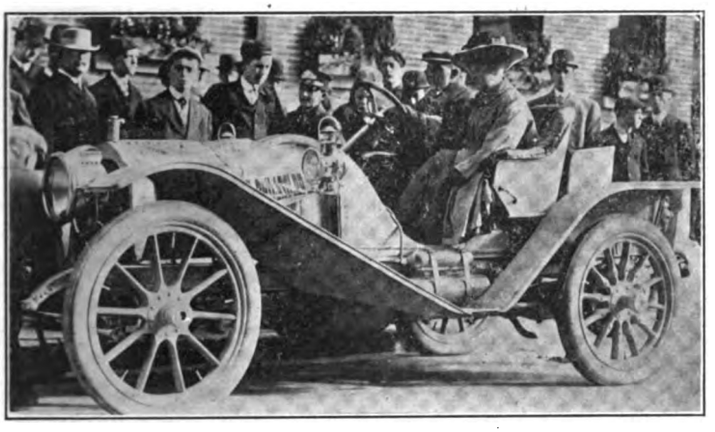
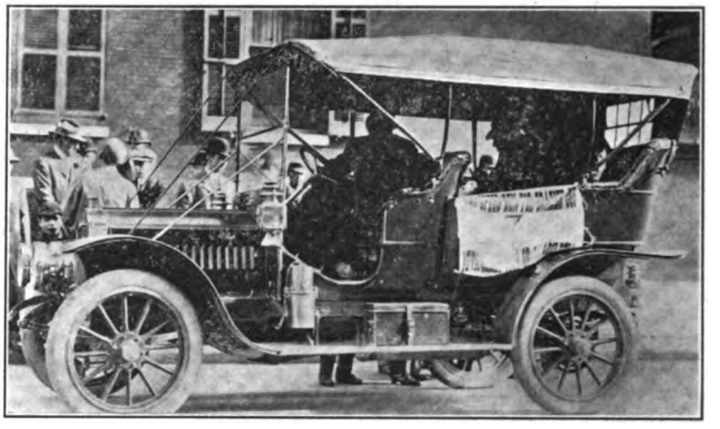
FLETCHER "LIFTS" BRAZIER CUP

Only Nine Contestants in Philadelphia Automobile Club's Touring Contest—Legal Speed Over Short Course.



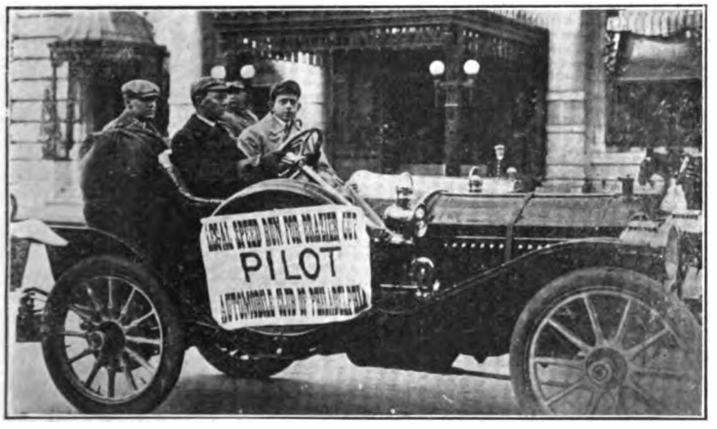
A touring contest over a course only 65 miles in length is quite a homoeopathic dose for the up to date motorist, and the winning of a trophy under such conditions does not seem a difficult matter. Nevertheless the nine members of the Automobile Club of Philadelphia, who set out on the sixth annual contest for the Brazier cup on Saturday, 31st ult., found occasion for some perplexity, and incidentally lost two of their number before going the full distance over the 64.9 miles route. Gustavus B. Fletcher driving a Packard runabout, carried off first prize. In doing so, Fletcher repeated his victory of three years ago, when he succeeded in lifting the trophy under more exciting conditions.

The contest was not one of endurance, high speed, reliability, or any other conditions very strenuous. Instead, the scheme was for contestants to adhere as closely as possible to a schedule that would exactly coincide with legal speed limits. A total running time of 3 hours 47 minutes 10 seconds was alloted, making the contestants reckon upon an average speed of about 16 miles per hour. Three blind controls were scattered along the route, which was through Lansdowne, Swathmore, Media, Devon and Norristown and back to the Quaker City, and the times of all the contestants were taken as they passed the three points. Penalizations were imposed upon cars passing controls behind or ahead of time—one point for each minute early or late. Repairs and adjustments were not taken into consideration.

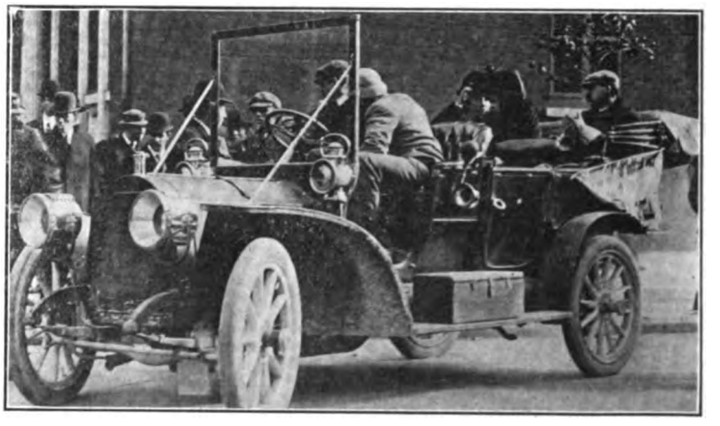


When the nine contesting cars checked in at the finish and the committee began the arithmetical process of putting down six and carrying two, Fletcher was credited with covering the distance with 17.5 points against him, which was just one minute better than his nearest competitor, H. P. Bailey (Winton). Frank Hardart, Jr., with an Elmore, and C. Y. Abbott, in a Pennsylvania, tied for third honors, each having a penalization of 22 marks. Seven of the nine starters finished the run within the five hours limit, J. R. Curtis's Franklin and W. S. Harding's Autocar being disqualified for staying out too late.

Most of the confetti which chickens did not eat, was swept in many directions by a promiscuous breeze, so that at forks in roads, it scarcely served its purpose. Contestants for the most part, however, had little difficulty in following the course. At Devon, there was a slight mix-up, owing to the regular road being torn up and this necessitated a detour. The roads were in very fair condition, barring a few bad stretches, and while the wind was a high one, it exhilarated, rather than annoyed, the competitors.



"The club's run for the Brazier Cup on Saturday was a farce," declared a prominent member. "It was really too sad to be amusing. Could anything be more ridiculous than a club enjoying a membership of upward of 700 owners of motor vehicles, mustering a turnout of as many as nine cars in its annual road competition? The conditions all favored a large representation—owners of cars holding membership in the club or members of their immediate families were called upon to drive, and this eliminated the possibility of any specially prepared manufacturers' car in the hands of factory experts coming into unfair competition with the bona fide amateur."



FLETCHER, PACKARD, THE WINNER

HARDART, ELMORE, WHO FINISHED FOURTH

PILOT CAR THAT SET THE LEGAL PACE

MILLER, PACKARD, PENALIZED 52 POINTS

The score of the day was as follows:

	Penalty. M. S.
G. B. Fletcher, Packard	17:30
H. P. Bailey, Winton	18:30
C. Y. Abbott, Pennsylvania	22:00
Frank Hardart, Elmore	22:00
Horace Allen, Buick	32:00
E. L. Miller, Packard	52:00
J. D. Avil, Pope-Hartford	71:30
J. R. Curtis, Franklin	Out
W. S. Harding, Autocar	Out

MUDDLES MAR DAYTON RACEMEET

Regular Card Greatly Curtailed and One Contest Results in a Squabble—Confusion Attends Novelty Event.

It is to be hoped that the next time Dayton, O., promoters hold a race meet, their efforts will be crowned with a greater measure of success than on the occasion of their first attempt. A series of automobile track contests which was undertaken on Saturday last, 28th ult., resulted in a miserable fizzle. Fourteen events were scheduled as an afternoon program and only four were run off, one of which ended in a row and was called "no race." Few spectators turned out to witness the meet, and the grandstand and rails held but a small number of motor enthusiasts. Many of those present were so disgusted with the way things were run, that they departed before the races were over. Indeed, practically the only sucessful feature of the meet was L. B. Lorimer's performance in the Chalmers-Detroit "Bluebird." He shattered the one-mile record of that half-mile track (1:21½), made some time ago by B. Oldfield, the track "artist." Lorimer sent the Bird around for two laps in 1:16⅘ in an exhibition after taking a flying start.

After a 3 miles handicap motorcycle curtain-raiser, a few motor cars, selling at $2,000 or less, lined up for a 2 miles event. They kicked up the dust for a half-dozen laps to a successful finish, when the trouble began. Irving Knupp and Otto Wolveries in Buicks led all the way, the former crossing the line first. Following were W. R. Burns in his Chalmers-Detroit "30" and Lang's Overland, but instead of awarding the cup to Krupp, the judges gave the decision to Burns in the Chalmers, on the ground that the other entrants did not comply with the requirements, by not carrying three persons, including the driver. Howls of disapproval went up from the spectators and a small sized riot was threatened. After a few minutes, however, Hugh Chalmers of the Chalmers-Detroit Company, who was present, said he was willing that the event should be declared off, as he wanted nothing but a clean cut victory for his car, with no "ifs" and "buts" about its place at the finish. This settled the trouble, the judges officially calling the race off. It seems the race called for touring cars, of which the Chalmers was the only competitor; however, it was provided that runabouts might enter, provided they carried three passengers. This point, it was ascertained, was misunderstood by the Buick drivers.

The next "number" attempted was a 2 miles "special" event for Buick cars only, and Otto Wolveries captured it with Knupp second, in tame style, to the tune of 3:02. This was followed by an open novelty race, to which cars of any horsepower were eligible. The conditions were: that the operator drive his car for the first lap alone; at the end of the first lap pick up three men passengers; at the end of the second lap discharge all passengers; at the end of the third lap pick up passengers again; at the end of the fourth lap, discharge passengers; finishing the fifth lap alone. Cars had to be in bounds before loading and unloading passengers. In endeavoring to pursue this elaborate plan, most of the contestants became sadly confused. Wolveries won the event in 4:40 time, but the balance of the competitors were disqualified for not unloading their passengers properly.

Following this, general impromptu exhibition events were run off in an effort to comfort the disappointed spectators. After making his mile trial, Lorimer fought Paxon in a Jackson a mile match race. The "Bluebird" outdid its contestant, however, due in some measure to the Jackson having been damaged to some extent when it caught fire earlier in the day. Lorimer's time for the distance, one mile, was 1:30⅘.

Fred Huyck on an Indian motorcycle beat Knupp driving his Buick from a flying start in a 3 miles brush and John Lewis drove an exhibition mile with a heavy Speedwell truck, in 1:58. But watching a truck roll around all by itself was not very exciting, so a couple of additional motorcycle races were reeled off to wind up the affair.

Denver to Hold an Economy Contest.

On November 7, the Denver Motor Club, Denver, Colo., which was organized last summer, will conduct its first gasolene consumption contest on a run from Denver to Greeley, Colo., under conditions prescribed by the technical board of the American Automobile Association. Owing to the nature of the test, the rules adopted are not very stringent, the cars merely being required to adhere to a schedule not greater than that set by the pilot car, check in at the controls within a reasonable time, completing the round trip by not later than 5 p. m. Work on tires and other parts of the car necessary for safe running will be permitted without penalization, with the exception of carburetter adjustment or other regulation of the motor necessitating the breaking of hood seals. The score percentages will be determined by the formula: weight of car, including passengers, divided by the weight of gasolene consumed, expressed in half ounces. The Ralph W. Smith cup will be awarded to the contestant securing the highest percentage on this basis, while a second silver cup will be given to the driver completing the run with the least gasolene consumption, regardless of weight or percentage.

London Taximeter Cabs Worth $20,000,000.

Recent estimates place the value of London's taxicabs at $20,000,000. Many of the machines are owned by their drivers.

"BIG THREE" THRILL NASHVILLE

Oldfield, Christie and Soules Give Their Hair Raising Performances There—"Tennessee State Record" Falls.

That renowned trio of melodramatic thrillers and monarchs of the merry-go-round school of driving, namely, B. Oldfield, W. Christie and C. Soules, served a fine exhibition of "keen dare-devilish competition" to the awe-inspired spectators at Nashville, Tenn., on Saturday, the 24th ult. The "feature" of the afternoon was a two miles event between Soules in the "Red Devil" and Christie driving his "Record Breaker," in which the former won. Christie got away first and held the lead with his opponent almost touching his rear tires, until the last eighth of a mile, when Soules shot to the front and led the front-wheel drive car at the finish by half a length in 2:07.

As is customary wherever the "noble three" perform, Oldfield beat Soules a few moments later in a 3 miles spin. Soules led until the stretch very neatly, letting Barney pass him just in time to make the race another Oldfield victory in 3:02. Later Oldfield covered a mile in his Stearns racer in 0.55¾, claiming to lower the "Tennessee State record," whatever that was. The best that Christie could do was a mile in 0.59, which he accomplished after several attempts.

In a 5 miles exhibition, Soules skirted the track in lively fashion, covering it in 4:55⅘, while in a 2 miles race for touring cars with Butler and Conners, two local drivers, in a Buick and Stoddard-Dayton, respectively, Soules also triumphed.

Time Trials Carded for Motor Parkway.

That the Long Island Motor Parkway is not destined to remain long in idleness is evidenced by the anouncement that a series of speed trials against time will be held on Saturday, December 31, under auspices of the Long Island Motor Parkway, Inc. Cars which competed in the recent Parkway Sweepstakes event (for machines selling at $4,001 and over), Vanderbilt Cup cars and racers of the Grand Prize type, will be the only ones eligible. The trials are to be at one mile, two miles and one kilometer.

Owing to the lateness of the season, and in order that each car may have at least two trials, it is expected to start the events promptly at 12 o'clock noon. Arrangements are being made so that cars will be automatically timed for each of the three distances, the finishes of which will be uniformly at the grandstand.

Entry blanks will be ready for distribution this week, from the office of A. R. Pardington, vice-president tnd general manager of the Parkway, at 527 Fifth avenue, New York City.

TWENTY-TWO GRAND PRIZE ENTRIES

America, Germany, France and Italy Represented—Savannah Makes Lavish Preparations for the Event.

When the entries for the Thanksgiving Day Grand Prize race, to be held at Savannah, closed on Monday, November 2. the list totalled up to 22 cars. The late entries of a Chadwick and a National—both six-cylinder cars—and a Simplex, completed the American team of half a dozen, while of the foreigners, France and Germany are each represented by five entries, and Italy with six. In the light car race, there are 17 contenders—a quartet each of Maxwells and Buicks, three Chalmer-Detroits, and one each of American Aristocrat, Cameron, Lancia, S. P. O., Gregoire and Isotta; the four latter being the only foreign cars entered in the shorter event. A trio of De Dions and two Gyroscopes, as well as the three Oldsmobiles previously entered, have been withdrawn. Two entries in the big class will not start; the Matheson and the B. L. M.—the latter following its usual custom.

The Chadwick entry, which Willie Haupt is scheduled to drive in the Grand Prize competition, was announced the latter part of last week and on the closing date, Charles A Singer announced that a Simplex car would be put into the fray with M. J. Seymour at the wheel, while the National Motor Vehicle Co. rushed in the formal entry of one of its "sixes," not naming the driver. The nomination of these three cars augments the chances of America's team considerably. Both Haupt and Seymour participated in the Vanderbilt Cup race on the Long Island Motor Parkway two weeks ago.

Foreign drivers have been arriving in goodly numbers during the past week. Wagner, Nazzaro, Duray, Hautvast and Rigal came in on "La Lorraine" last Saturday, the three former having visited America before to drive in Vanderbilt Cup races. Rigal and Hautvast are on their initial trip to America. Cagno and Piacenza, the two Italian pilots, reached here Tuesday before last and spent the week "seeing New York," although the former had seen it two years ago. When "La Touraine" arrives next Saturday, it will bring in a cargo of foreign cracks, among whom will be Hemery, Hanriot and Erle, the trio of Benz drivers; Szisz, of Renault fame, and Fournier, the third of the Itala crew, with their retinue of factory men. Fournier is known to many American motorists of the pioneer days, who recall his performance on the Coney Island boulevard. The first of the visitors to start for Savannah were Wagner and Nazzaro, on Tuesday, with Ralph De Palma, the third member of the Fiat team; also Piacenza and Cagno, of the Itala forces, and Duray, driver of the De Dietrich car.

There has been no change in the announcement of the American drivers in the big race at Savannah, with the exception that Louis J. Bergdoll has nominated H. F. Grant to handle his Locomotive instead of the entrant driving himself as originally planned. Patschke will have charge of the Acme; Michener, the Lozier, while Seymour and Haupt will pilot the Simplex and Chadwick, respectively. Strang and De Palma are the only two Americans who will be at the wheels of foreign cars. The interesting news was broken yesterday (Wednesday) that George Robertson will pilot the French Gregoire car entered by Henri Neubauer for the light car race. This nomination means that this voiturette, which is little known to Americans, will be closely watched on the 25th.

Savannah is continuing its elaborate preparations for the big event, not only upon the course, but with a view to accommodating thousands of expected visitors. A house to house canvas is said to have disclosed prospective accommodation for no less than 18,000 visitors, though this hardly seems creditable to those who witnessed the stock car race of last April.

Of course, country trails have been turned into 60-foot macadam roads. Turns have been banked; the course within a course—the 10 miles route over which the light car race will be run on the day preceding the Grand Prize, is now well on the way to completion.

In the neighborhood of $32,000 has been spent on the roads and the labor of a thousand convicts has been donated by the State to bring the course up to the requirements.

Altogether, Savannah still remains true to the conviction that the Grand Prize will be the grandest contest of the sort ever seen in the country, and there is small doubt that it will be a big and hard fought contest. Also, if the tourist agencies and their allies in the daily press have their way the endorsement of a huge popular attendance also will not be lacking. As a matter of fact, it is on this particular phase of the affair that the question of the venture really hangs.

Desert Race Scheduled for November 7.

November 7 has been set as the date for the "great desert race and sand battle" which is to take the form of a road race between Los Angeles, Cal., and Phoenix, Ariz., although there is a possibility of the contest being postponed until some days later. This affair which the Maricopa Automobile Club is agitating in the far southwest has but three entries so far, though others are in prospect. The entrants are: A. J. Smith, who expects to pilot his Elmore "Bulldog"; Leon T. Shettler, who is banking on his Kisselkar, and R. J. Leavitt, the local Locomobile agent, who will endeavor to score another Locomobile victory.

PLANNING THE NEW RACING CLUB

Initial Steps Taken for Organizing Body to Control Speed and Other Contests—Probable Leaders in Personnel.

Pursuant to the clause in the treaty between the American Automobile Association and the Automobile Club of America by which it was provided that the A. C. A. should retire from the management of racing affairs after this year, ceding its control of the Grand Prize to an organization to be formed under the control of the Long Island Motor Parkway, which also was to handle the future contests for the Vanderbilt Cup, announcement was made early this week that the initial steps looking toward the formation of such an organization had been taken and that its full composition would be announced within a short time. That arrangements for the complete institution of this body will be completed within a few weeks is to be inferred from the urgent necessity of getting out plans for the big contests of next year in season for the manufacturers who desire to enter cars, to be able to make ample preparations for the coming contests.

It is stated that the new club is intended to take the same position in automobile racing which the Jockey Club holds in horse racing affairs. The organization, nominally at least, will be non-partisan so far as the late differences of the A. A. A. and A. C. A. are concerned, but will fuse the interests now controlled separately by these two bodies in a common and exclusively racing management. Naturally, the powers behind the Long Island Motor Parkway are keenly interested in the venture, and it is even intimated that at some future time the headquarters named—will be located on that course. Whether the present Vanderbilt Cup Commission will be disbanded or whether it will continue its jurisdiction over the trophy in its new status, remains to be decided. Certainly the new body will in no way be a rival of the commission. In fact the membership of the two will hold several names in common. Of these, that of William K. Vanderbilt, Jr., donor of the cup, of course will figure most prominently. Jefferson De Mont Thompson also is interested in the movement, it is said, while Henry Sanderson, W. G. McAdoo, W. M. Hamilton and Robert Lee Morrell also are mentioned.

Campbell Heads New Orleans Club.

At a meeting of the newly formed New Orleans Automobile Club, held on Monday, 26th ult., officers were elected and the idea of affiliating with the American Automobile Association was talked over. Thomas C. Campbell was voted president; Theodore Grunewald, vice-president; and Homer George, secretary and treasurer.

RACING PUTS DALLAS ON EDGE

Twenty-five Thousand Spectators Grow Excited Over Automobile Contests—Tone Captures Chief Event.

If any one entertains more doubt as to the popularity of automobile track racing in the Lone Star State, that person should have been at the State Fair meet at Dallas, Tex., on Sunday, November 1, when the cars buzzed around the saucer before an excited throng of fully 25,000 people. The interest was keen from the very first getaway, in a 10 miles brush between W. Gale (Buick); P. R. Plummer (Ford), F. Malone (Pope), and J. M. Girard (Packard). The latter, who was the favorite, captured the event in 13:58, after giving Gale a hot chase and not catching him until the tenth mile. The others were outclassed from the start and lapped before they had gotten very far.

This served to whet the appetite of the crowds for the second spasm, a 50 miles affair, which was won handily by Tone, driving an American Roadster, when George Clark's Pope and P. W. Willard's Stearns met with trouble.

Steamers were barred from competition events, but Seyfried, in a White steam stock car set out in an attempt to clip the track record. He was unsuccessful, however, his best time being 1:02½, which was the fastest time of the day. This, in view of the fact that the White was not allowed to enter competition events speaks for itself.

A 10 miles event for cars of 30 h. p., and over saw only two contenders—Clark, in a Thomas, and Hill, in an Oldsmobile. Clark got the jump on his opponent, and kept increasing the gap until the third mile, when something went wrong. The driver, however, kept up his nerve and presently had the car running well again, lapping Hill on the eighth round and taking first in 12:45⅞.

When the 10 miles free-for-all event was called, but two cars appeared at the line. Shortly after they left the tape it was noticed that Bertrand's Pope-Toledo had caught fire. When the flames were extinguished and the race re-started, Tone in the American toyed with the Pope driver until the last lap, when, satisfied with showing how easy he considered his opponent, he bid for the applause of the multitude, made a grandstand play and won in 12:28½.

Clark in a Thomas, won an amusing novelty race, and then Gus Seyfried, in the White, began to perform again. Inasmuch as no one accepted the White's challenge to a five miles bout, Seyfried did the next best thing and drove a five miles exhibition with his stock car; Dundee's specially built White Flyer having been wrecked in practice, when it went through a fence. Seyfried's time was 1:03½, 2:06, 3:10½, 4:14, 5:18⅗. Following which, Tone drove a 2 miles exhibition with the American in 2:08¾.

Strang to Star at New Orleans Meet.

Having billed Lewis Strang as the "world's champion auto racer" in the local press and on the fences in New Orleans, La., the promoters of a two days race meet to be held in that city on November 7 and 8 have agitated the public in that section of the south up to a point where they take it for granted that Strang will break all sorts of world's records and do much manner of wonderful things. His two Renault cars have reached New Orleans and the "dare-devil driver" who will pilot them, is reported as having headed for that city. The old Peerless "Green Dragon," which has gone through about as many processes of rebuilding and replacing of parts as the "original Florodora Sextette" did in its palmy days, will be an added attraction. This merry old car is now said to be the property of James A. Clark, a New York millionaire, and Strang is scheduled to whirl it around for a few laps. The newly organized New Orleans Automobile Club, under whose auspices the meet is to be held, has applied to the American Automobile Association for a sanction.

Racers Must Stop to Examine Tires.

In connection with the track meet scheduled for Denver, Col., on Thanksgiving Day, a novel suggestion has been made with regard to the 25 miles event. It is reported that after covering twelve miles of this race, contestants will be obliged to stop and thoroughly examine their tires. Just why it is deemed necessary to stop after going the short distance of a dozen miles, when in longer and faster races, such stops are not made as a rule, is not disclosed. Tires, it seems, will be the only things examined and if the expert eyes of driver or mechanician perceive that a set of tubes is about to blow out after the hard going over the dozen laps of oiled course, they will be changed and thoroughly healthy ones substituted.

Quaker City Plans a Race Meet.

That 24 hours race that was proposed by some of the members of the Quaker City Motor Club will not take place. A race of 500 miles or so, however, may be run at Point Breeze track on Saturday, November 14, or in lieu of that a number of short distance events. The board of governors of the club has empowered the racing committee to hold a race meet on that date, although it limits the time for such an event from 7 a. m. to 5 p. m.—very peculiar hours. Point Breeze has been definitely decided upon as the scene of the meet, but the rest of the details have not yet been announced by the racing committee.

CHICAGO CLUB PLANS NOVEL MEET

Ten Days Reliability Contest for Electric Vehicles to Cover 1,000 Miles—Rules of Penalization.

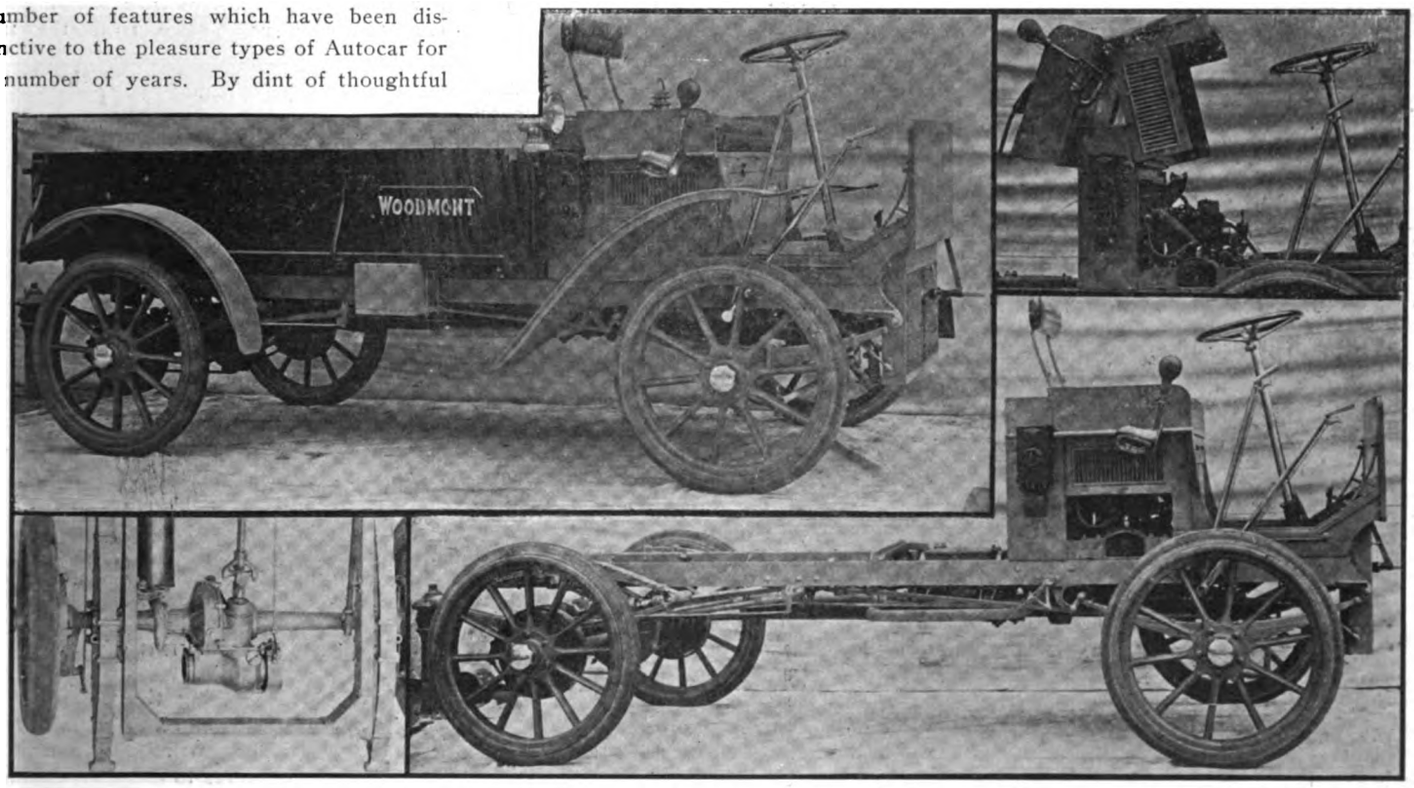
Provided the plans of the Chicago Motor Club go through as smoothly as the technical committee anticipates, its 1908 contest season will conclude with a ten days reliability test for electric automobiles, to take place in November. Frank Perley, of the Babcock Electric Co., recently made an application to the club for such a contest, to be conducted along lines similar to that of the recent 1,000 miles reliability test for gasolene and steam cars.

The various Chicago branches of the electric manufacturers, including the Studebaker, Columbia, Baker, Anderson Carriage Co., and Woods, appear to be strongly in favor of the proposed event, the like of which has never before been held. The technical committee is in favor of having the run cover a route of 1,000 miles or so, including an average of 100 miles a day, wth a varyng speed schedule—20 miles an hour for one day, 15 for the next, ten for the next and on other days a combination of speeds between different controls. Rules would provide penalties for replacements, repairs and work done on machines, with due allowances for recharging.

Following the Hounds by Motor.

Fox hunting with no red-coated equestrians and with a Gabriel horn, instead of a bugle, for summoning the hounds is the unpicturesque system employed by Professor J. F. Draughon, of Nashville, Tenn., who now uses a motor car instead of horses for this sport. His hunting ground is about 30 miles from Nashville, and in order to transport his pack of 37 registered dogs to the scene of action he has devised a large trailer which he couples to the back of his machine. When the scent has been struck, the trailer is left by the roadside and the professor's car may be seen scurrying up lanes and crossroads so that he may be in at the death. After the fox has been run down, Draughon returns to his trailer, toots vigorously on his exhaust horn for the wanderers of his pack, and after they are all assembled piles them into their cages on the trailer for the haul back to town.

St. Louis to Hold Three Days Carnival.



St. Louis (Mo.) motorists are arranging for a three-day carnival for Friday, Saturday and Sunday, November 6, 7 and 8. The Manufacturers & Dealers Association's hill-climb, which was scheduled for November 2, has been postponed to Friday, November 6, the opening day of the carnival. On the two following days, there will be a track meet at the Fair Grounds where Christie, Oldfield and Soules will appear.

AUTOCAR COMMERCIAL VEHICLE

New Product Designed Along Independent Lines Adapted to Large Range of Use —Its Noteworthy Features.

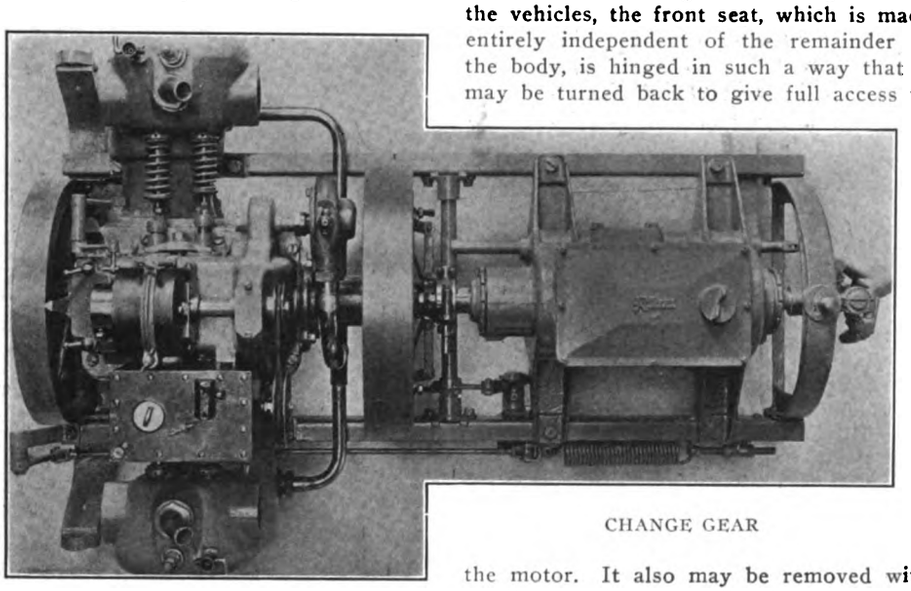
On the sound principle that the duties of the purely utility vehicle are so radically different from those of the pleasure car as to permit of no confusion between the various components of the two types, the new line of commercial cars which recently was announced by the Autocar Co., Ardmore, Pa., has been built along entirely new and independent lines, though introducing a number of features which have been distinctive to the pleasure types of Autocar for a number of years. By dint of thoughtful handling of the design also, an unusually comprehensive range of purposes may be served by these machines, though they are made in but two lengths of wheel base, and otherwise conform to a single standard of construction.

AUTOCAR DELIVERY WAGON, OPEN BODY, CHASSIS AND DETAILS SHOWING REAR AXLE CONSTRUCTION AND ACCESSIBILITY OF MOTOR

In fact, but for this distinction and the different sizes of body which may be adapted to them they are practically identical. A single exception to this is in the specification for tires, which in the smaller chassis are pneumatic and in the larger, or rather longer, solid. The former has an 85 inch wheel base, and accommodates a body platform 48 inches wide and 68 to 90 inches in length, according to requirement. The latter has a platform 48 inches wide, and is capable of taking any desired body length between the limits of 80 and 100 inches. For the lighter work of the short wheel base machine, 32 by 4 inches pneumatic tires are employed, while the larger car is shod with 32 by 3½ inch solid tires. The shorter vehicle is intended primarily for commercial passenger work, while the other is capable of handling either heavier delivery work or light freight haulage, and is rated up to 2,000 pounds load capacity.

In the design of the machine—considering both vehicles as of uniform construction for the sake of brevity—the objects of working economy and interchangeability have been served by the use of a complete and independent power plant, which is given a three-point mounting on the main frame, and a driving axle construction which permits of ready removal from the chassis as a unit, or almost complete dissection without disturbing the body. This object, in the case of the power plant, has been worked out in such a way that when it is not desired to remove the plant as a whole, either the motor, gearing, gearset or clutch, or one or more of a number of important componants may be removed without disturbing the asemblage in other respects. The same result also is developed in the construction of the rear axle. Practically any part of the power plant or transmission may be dismounted without interfering with the adjacent parts except to disconnect it.

The power plant, though not mounted in a common housing, is carried by an independent subframe which is attached to the side members of the main frame at two points in front, and is carried in the rear by a single connection with a transverse yoke. The removal of the entire plant entails merely the relaxing of these three connections, and the disjointing of the necessary pipe connections.



The motor is of the double-opposed type, measuring 4¼ by 4½ inches bore and stroke, and yielding an A. L. A. M. rating of 18 horsepower. The valves, which are interchangeable, are placed on the upper sides of the cylinders, and worked from a single cam shaft. The crank shaft, which is mounted on extra large, Hess-Bright ball bearings, carries two fly wheels, one at either end, so counterbalanced as to compensate all vibration tendencies as closely as possible, making an unusually quiet running motor. The forward fly wheel carries fan blades, and replaces the usual belt-driven fan in assisting the cooling system. In the larger chassis, this fly wheel also carries a governor which limits the crank shaft speed to 1,300 revolutions per minute.

Magneto ignition is a standard feature of the equipment, the magneto itself being attached to the top of the crank case by means of a couple of wing bolts. It is so arranged that it can be removed or replaced without disturbing the timing. As it is of the low tension type, the coil which also is included in the equipment may be used for ignition with batteries. The upper section of the crank case, which is divided into two parts, carries the push rods and guides for the valve gear, the water pump driving gear, the magneto and oiler—the latter being secured by means of dowel pins and a single wing nut.

Digitized by Google

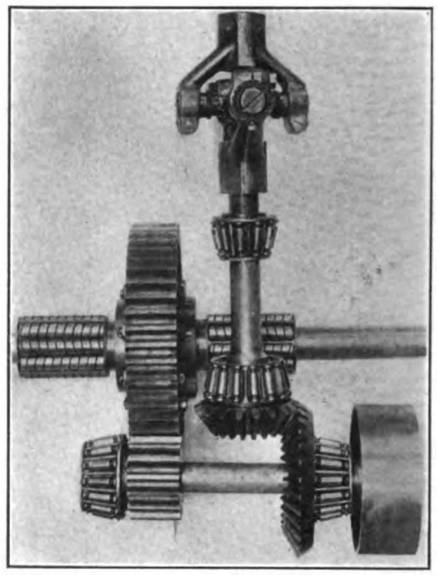
The rear fly wheel carries the clutch, which is of the three-plate pattern which has been employed on cars of this make for several years, with but slight modification. The central, bronze floating ring, is equipped with cork inserts. The change gear is of the progressive sliding gear type, affording three forward speeds, with a direct through drive on the high. It is mounted in a one-piece housing and both the lower, lay shaft, and the upper, driving member, are set in Timken roller bearings. The propeller shaft is equipped with two universal joints, and is arranged for a practically straight line drive under full-load spring deflection.

This is assisted by the design of the differential and reduction group mounted on the rear axle, which is of original and very unusual form, the usual simple bevel reduction being dispensed with in favor of a double reduction through bevel and spur gears. The propeller shaft, passing over the axle, drives a short counter shaft through beveled gears, while the latter is connected to the differential member by means of a pair of heavy spur pinions. Advantage is taken of the position of the countershaft, to mount upon its extension a wide faced drum for the application of the emergency brake. By eliminating the large single reduction which otherwise would be necessary and the consequent weakness of the smaller bevel gear, added reliability has been secured, while the use of the countershaft also permits a considerable variation in the final driving ratio as required. This may be anywhere between 3.71 and 5.57 to 1, according to the gear sizes employed.

AUTOCAR MOTOR

Considerable originality also is displayed in the construction of the rear axle itself. The driving stubs are squared at both ends, the inner end which is mounted on Hyatt roller bearings, slipping into the differential gearing, while the outer end is carried by Timken bearings. The latter bearings are so arranged that the inner member on a turn carries the end thrust of the wheels. The axle housing is in five pieces, no parts being riveted or brazed, and the spring seats and brake supports are made integral with the axle tubes. The central portion of the housing, which carries the countershaft, is removable, and all parts except the large gear on the differential may be removed from the axle without taking the latter from under the car. The front axle is tubular, equipped with Elliott steering knuckles, and the front wheels are mounted on Timken bearings. The frame is of armored wood, and is supported by semi-elliptical springs in front and full elliptics in the rear.

To return to the general arrangement of the vehicles, the front seat, which is made entirely independent of the remainder of the body, is hinged in such a way that it may be turned back to give full access to the motor. It also may be removed with small loss of time, while side doors give access to the working parts for minor adjustments. Control is accomplished by means of the usual double pedal-double lever arrangements, with motor controlling devices mounted on the steering wheel. By this arrangement, the style and disposition of the body is left entirely to the option of the purchaser, who in place of the stock type of body, may have any special type which he may require. Numerous varieties of freight-carrying bodies are adapted to the chassis, while the passenger arrangements may be made to include anything from a 12 passenger omnibus to a neat and unusually roomy little landaulette seating four passengers inside.



CHANGE GEAR

Regular Route for "Trouble Car."

"Trouble cars" or traveling repair shops are by no means novel as far as the basic idea of sending a heavy machine out on the road equipped with a full allotment of repair parts and tools is concerned, but the method of a British repairer in handling such a machine is commendable as well as novel in its enterprise. On Sundays and other holidays when the motor traffic along certain well known roads in the vicinity of Brighton is likely to be heavy, the machine in question is given a regular route to be covered and a schedule. In addition to this, telephone stations are established at points along its "beat," and the man in charge is directed to keep in regular communication with the dispatching point. By this means motorists anywhere within a considerable range of highway are enabled to secure efficient repair service within a short time, and as the wagon carries a full assortment of such supplies as are likely to be required, delays in consequence of the more common forms of accident are comparatively brief.

Clearing Tire Valves of Dirt.

One of the minor precautions which may have a great deal to do with securing the expected efficient service from the tire valves is that of giving the pump a few sharp idle strokes before attaching it to the tube preparatory to inflating a troublesome tire. This serves to drive all dust and dirt from the nozzle and tube, and thus prevents it from being forced into the valve when inflation commences.

REAR AXLE DRIVING GROUP

Automatic Air Valves Must be Clean.

Automatic air valves such as are an almost invariable accompaniment of so-called automatic carburetters, should be kept scrupulously clean. The slightest accumulation of dust, grease or dirt of any sort, either about their stems or seatings may be sufficient to upset their working and causing the most perplexing or running difficulties.

Glass Hoods on Demonstration Cars.

Glass hoods fitted with interior electric lights for displaying the motor to public view are growing popular with dealers who like to attract attention to their demonstrating cars. The moving parts of the mechanism catch the eye, and the plate glass panels of the hood suggest something particularly rare and fine underneath.

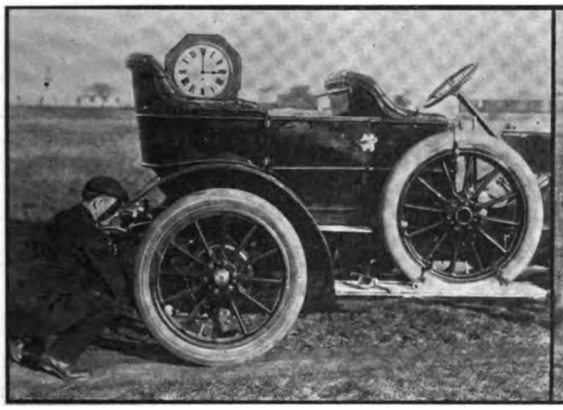
RAMBLER ANNOUNCES SPARE WHEEL



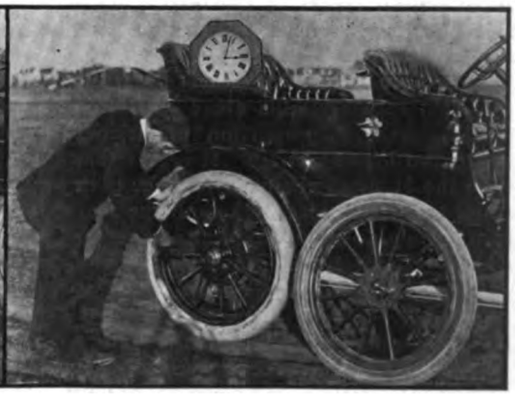
Particulars of New Optional Equipment for 1909—Ready Replacement in Case of Tire or Wheel Trouble.

As a sort of supplementary announcement to the forecast for the 1909 Rambler line, which was recently made by Thomas B. Jeffery & Co., Kenosha, Wis., the particulars of a unique added feature of the equipment have just been disclosed in a description of the spare wheel arrangement which is applicable as an option to the full line for the coming season. One of the first intimations that such an innovation was in contemplation came in connection with the Carriage Dealers' show in Grand Central Palace last month, when one of the new "fifth wheels" was shown in connection with the Rambler exhibit. Information as to its exact purpose and method of application was somewhat sparingly given at that time, however, and it was not until this week that full details of the system were made public.

From this it appears that the emergency wheel is a duplicate of the regular equipment of the car in every respect, carrying a spare tire ready inflated, and suitable for application to either of the wheels as occasion may demand. Special brackets are provided for carrying the wheels, and as it is a counterpart of the others, it may be used not only in case of tire trouble, but also in replacing an injured wheel. In general the spare wheel is carried on the running board with its extra tire, and when required as a substitute, the one which it replaces becomes the spare, no re-changing being necessary until demanded by roadside difficulties.

The wheel is secured to the hub center by six bolts. Removing the six nuts from these bolts, the wheel can be detached by means of special tools, a wheel puller and a socket wrench. Only three minutes are required to make the change.

In proof of this assertion the accompanying illustrations are exhibited as showing both the time-saving proclivities of the system and also the method of its application. In the first of the upper illustrations the operator is shown in the act of jacking up a wheel which has suffered a punctured tire, the hands of the clock indicating exactly 3 p. m. In the second illustration the nuts which held the wheel in place are seen to have been removed and placed on the running board, the wheel thus being made ready for removal. Two minutes have been occupied in the process. The first of the lower pictures shows the operator in the act of changing the wheels, the one mounting the new tire being all ready to go into place. In the fourth and last picture of the series, the new wheel and tire are shown in place, and the last of the securing nuts set home, the clock indicating that but 3 minutes have elapsed while the process was going on.



JACKING UP THE WHEEL

REMOVING NUTS

SUBSTITUTING WHEEL

SECURING THE FASTENINGS

Of the three methods of quick relief for tire trouble in present use, this has the advantage in a number of respects. The use of demountable rims alone, though conducive to ready replacement and gaining through the light weight of the extra equipment, is useless where the wheel as well as the tire is damaged. The so-called emergency wheel, which consists of an extra rim which may be clamped to the side of the wheel carrying the damaged tire also suffers from the same drawback. While the requirement for a complete extra wheel is the rarest kind of an emergency, the need is all the more imperative when it arises. Since it may be supplied with no more effort than is required to shift the ordinary demountable device the benefit derivable from its use is obvious.

B. & S. Offer Improved Tools.

With anything like a full set of angle wrenches, the motorist is generally able to take care of all the nuts and bolts that are to be found on his car. A new outfit, comprising seven such wrenches put up in a serviceable waterproof bag, is being offered by the Billings & Spencer Co., of Hartford, Conn., who have long been well known in connection with products of this kind. The wrenches are double ended, of 15 degrees angle, and the 14 sizes of milled openings range from 7-16 inch to 1¼ inches. Either semi-finish or full case hardened finish is provided for the shanks. The containing bag is made of duck or drill, and is arranged to keep each size in a place of its own.

Eleven sizes of a new and improved screw drivers are also being put out by the company. It is complete in one piece, except for the addition of the wood side pieces on the handle to provide an agreeable grip. A drop forging is used for the construction, and the point is carefully tempered.

Keeping Down the Tire Expense.

It has been declared that no less than three-quarters of the motoring public spends something like 20 per cent. more for tires than is really necessary. If care were taken to maintain the tire equipment as nearly as possible at the inflation pressure which is recommended by the makers, the cost of repairs and replacements would be reduced to a surprising extent.

Replacement of a Noisy Gearset.

When it is desired to allay the noise of a set of worn gears it must be remembered that the replacement of a single gear will have little or no effect in this respect. It is only by the renewal of both members of a noisy pair that the desired effect may be secured.

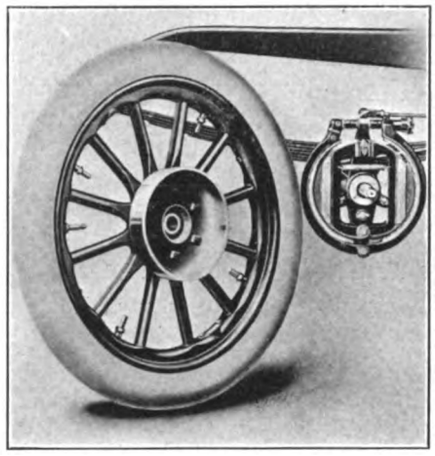
SELECTION OF BRAKE MATERIAL

Comparative Braking and Driving Powers Shown by Tests—Asbestos Composition Gives Best Results.



That it requires at least four times as much power to stop a car as it does to set it in motion, considering the averages of positive and negative acceleration, is a fact which when properly assimilated helps the average motorist to gain an added respect for the braking equipment of his car. This surprising testimony to the work which the braking equipment may be called upon to perform was brought out in a series of tests recently conducted by the Maxwell-Briscoe Motor Co., and was supplemented by a trial of various sorts of friction surfaces suitable for brake materials, conducted on the highways in the vicinity of the Tarrytown plant.

The relation between the power required to start a car under average conditions and that required to stop it, is based upon experimental data which has shown that about 300 yards are covered by the average machine before it can gain its full headway from a standing start. But no less than 75 feet will be required to bring the machine to a full stop when traveling at its top speed. From these distances, the ratio of the respective accelerating powers have been calculated.

The deductions from these experiments have led to but one conclusion as to the only proper place for a brake to operate, says an official report of the tests. Since everything between the brake and the wheel must be subjected to this enormous strain, the brake and the wheel must be constructed together; this alone will eliminate the great disproportion of driving strength and braking strain. It is this that has led the Maxwell company to place both the foot and emergency brakes on the rear hubs, the only position where all danger of breakage is entirely done away with, and where the full efficiency of the brake is guaranteed.

The road tests were held near the factory on the morning of Wednesday, September 23. A smooth stretch of macadam road was selected, with plenty of room for getting up speed, and a four-cylinder car with a passenger capacity of five persons chosen, equipped with a standard double external contracting rear hub brake, which is here illustrated. With passengers the car weighed about 2,850 pounds. The first trial was made with the brakes lined with the new asbestos preparation used in the Maxwell cars and with the tonneau empty. The machine was speeded up to 30 miles an hour, and when the road mark crossed the driver's line of vision with the radiator, the brake was applied in full strength. The wheels immediately locked and the car came to a dead stop in 14 feet 10 inches, the distance measured from the line to the rear axles. Again it was tried. This time with the tonneau occupied; the wheels again locked immediately and the car came to a dead stop at a distance of 61 feet 6 inches from the line.

When the brake was thrown the wheels locked immediately and silently, there was no loss of time, undesirable noise, nor slippage. The other materials for brake lining were found to lack several of the most desirable characteristics of the asbestos lining. It was found that when cast iron blocks were used the car traveled about 25 feet before the wheels locked, that during that time the friction gave rise to a disagreeable scraping noise, and that due

ARRANGEMENT OF THE MAXWELL BRAKE

to the delay in the locking of the wheels the car traveled a considerable distance beyond the 61 feet of the asbestos. Hickory blocks were tried, but they too gave rise to the same disagreeable noise, it was found they burned easily and that the car covered approximately 17 feet before the wheels locked. Hickory blocks boiled in parafine showed improvement in the matter of noise and seemed to grip without the jerking experienced with the other two; they were found too to be more immune from combustion than the dry hickory—but they failed to lock the wheels until the car had traveled a distance of a little over 20 feet.

Red fiber, a papier mache product, was found to be better yet in the matter of noise, combustion and slippage, but the 12 feet found necessary to ensure locking the wheels debarred it when measured according to the standard of asbestos. Camel's hair was found most admirable; it was noiseless, it did not jerk, its life was long. But it too required about 12 feet in which to lock the wheels. Cork too was tried With the exception of the asbestos it was the most desirable; its life is long, it was noiseless, it gripped nearly instantly, but the gripping was accompanied by a severe jerking.

The observers therefore ranked the different materials in the following order for general efficiency:

1, Asbestos; 2, cork; 3, red fiber; camel's hair; 4, hickory blocks boiled in oil; 5, hickory blocks dry; 6, cast iron.

Causes of Drivers' Headaches.

Inexperienced drivers and occasionally those who have served quite a long time behind the steering wheel, frequently are annoyed by headaches which result directly from the strain of driving. Contrary to the prevailing impression, these are said not to be caused by the strain of constantly focussing the eyes on the shifting patch of road directly under the nose of the car, so much as by the use of ill-fitting goggles, or perhaps a cap which fits the brow too snugly. Another alleged cause of the difficulty is the use of headgear which is not sufficiently heavy to prevent the constant pouring of a blast of cold air directly upon the frontal bone. In any case, constant and unaccustomed pressure on the temples is quite as apt to be the cause of such uneasiness and pain in the head, experienced by the driver, as the stress upon the visional powers.

Growing Use of "Set Spark" Ignition.

It is stated upon good authority that at least 40 per cent. of the better known French makers have now adopted the "set spark" system of ignition regulation in preference to the use of the variable timing and hand regulation system which is in more common use in this country at this time. The advantage secured in ridding the driver of one of the numerous matters to be attended to in handling the machine, is obvious. The practice is made possible by the use of magneto ignition. The voltage of the magneto current increases with the speed, and the intensity of the spark consequently increases proportionately. This effect is supposed to compensate for the lead which otherwise would be required, so that the regulation is thus made automatic and in direct response to the speed.

Avoiding Looseness in Planetary Gear.

It is a wise precaution to go over the bolts which secure the several sections of a planetary transmission occasionally in order to see that no looseness exists. While the loss of one or more of these bolts might not permit the gear to separate entirely, there is danger that it may so weaken the fastenings as to allow the gears to work slightly out of their proper mesh, or that the remaining bolts be sheared off as a result of being overloaded.

About Refilling the Lubricator Tank.

When refilling the tank of a mechanically actuated lubricator the engine should be stopped. Otherwise there is danger of the formation of air locks with consequent interruption of the feed, if not its complete cessation.

THE PROBLEMS OF FIRE INSURANCE

Difficulties Attending Fair Adjustment of Cost to Risk on Automobiles and Garages—Fallacies and Absurdities.

Individual gambling instead of rational insurance methods appears to prevail in the writing of fire policies on garages and motor cars, with the result that in the majority of instances the rates are stiff enough to give the gamblers a more than ample surety of profit. The whole subject of this class of insurance is as yet wofully disorganized, and while some agents are busy writing policies at rates that are proving rich dividend payers, a great many companies refuse to touch garage and automobile risks at all, through a fear of gasolene and its vapor that would be ridiculous were it not of effect in keeping up the rates. Consequently, the insurance problem at present is one of most vague and unsatisfactory status, and affords all sorts of pitfalls for the unwary.

The insurance people plead that this field is so new that as yet there has not been sufficient time for any large statistical generalizations on the risks and losses, and that therefore it is difficult to determine any standards or basic rates from which to calculate. A few of the companies have fixed arbitrary bases of calculation, but these are subject to such haphazard methods of being added to for this and that item, as to make it impossible for a garage owner to find out where he stands.

Unfortunately the garage interests are even less organized than the insurance interests in the matter, and about the only representation that they have had before the insurance companies has been through the Association of Licensed Automobile Manufacturers and to some extent through the American Motor Car Manufacturers' Association. In an effort to prevent the National Fire Protective Association from adopting a set of "standard" garage specifications that would be so highly ideal that no practical garage could be built to meet them, Coker F. Clarkson, of the Licensed Association, met the members of the committee having the specifications in incubation and persuaded them to hold up any final recommendation or action until the subject could have a more thorough investigation than had been given it, and further that the garage and motor car interests might have opportunity to present their ideas as to what might be considered a reasonable standard.

The chief evil in the adoption of an impossible "standard" for garage specifications would be that every departure from the "standard" would be made the basis for further additions to the rate, so that the garages might better have no standard at all than one which would present such wide differences from the actual risks as to give an excuse for excessive charges. Particularly is this the case when the insurance companies themselves will not commit themselves to the point of saying that if "standard" specifications" are adopted by the N. F. P. A., they will grant a lower rate to those garages which conform to them.

Inasmuch as the National Fire Protective Association consists chiefly of local boards of underwriters together with architects' associations, building trades organizations and the like, and has no rate making power itself, the dangers presented by its making declarations of what should be standard practice in garages have no corresponding benefits. By earnest importuning Clarkson has succeeded in getting the association to hold off for the present, but he is in need of suggestions and support from the garage and motor car interests for whom he is endeavoring to secure fair treatment.

With a view to proving, if possible, that the average fire risk on garages in New York City is no more hazardous than the ordinary manufacturing risk, Clarkson has kept a fairly complete record of garage fires in New York City for about a year. An estimate of the total net loss as compared with the total premium that would be paid if the rate were the same as on ordinary manufacturing risks, shows the proportion of loss to premium to be about 59 per cent. This estimate would indicate that with practically no excess over the ordinary manufacturing rate, the companies could take the garage risks with safety and profit. Upon presenting these figures to the various insurance agents and general managers, however, he was politely told that they were far from correct, but no authoritative figures were produced to confirm the assertion.

Having obtained the names of practically all the brokers in New York dealing in automobile insurance, Clarkson is undertaking a canvass to learn from each the basis, if any, on which their rates are figured, and to learn, if possible, the proportion of loss to premium on this class of insurance in the past.

"The dangers of gasolene," he says, "have been so advertised and emphasized that many of the men responsible for the rates, through lack of actual knowledge, entertain a wholly unreasonable fear of it. Instead of attempting to base their rates on what actually occurs in the garages throughout the country, they figure on what might happen under unusual and improbable circumstances. The companies that have been bold enough to go after the garage business have not hesitated to demand big premiums, and the garage owners have not been in a position to fight for anything more favorable."

A distinction should be drawn, Clarkson thinks, between framing "standard" construction and equipment specifications and devising standard rules of garage conduct. In attempting the latter, the National Fire Protective Association would be doing a good work, he believes, since there are great possibilities of improvement in the enforcement of garage rules which would lessen the dangers of explosion and fire. It is a felony under the law even to enter shoddy mill with matches on the person, and in other lines of industry where there is a very high fire risk the employes have become trained in taking the necessary precautions, but the free and easy way in which gasolene and fire are juggled in most garages, while proving in its results that gasolene is not half so dangerous as most people suppose, undoubtedly adds to the risk and nullifies to a great extent whatever precautions may have been taken in construction and equipment. Standard rules concerning the use of safety cans, the extinguishing of car lights while the tanks are being filled, the provision of sand pails and pans, the forbidding of smoking, and similar regulations all might be incorporated in a standard set of rules for universal enforcement, whereas a standard of construction for garages would work great injustice in many cases owing to the widely differing conditions that obtain in various localities.

Even an extremely superficial inquiry into the present status of automobile and garage insurance and the regulations that are either enforced or proposed in connection with it, discloses many contradictions and absurdities. Most cities have regulations that forbid cars coming out on the streets after dark without lighted lamps, while proposed insurance regulations would forbid the lamps being lighted inside the garage, or even at the doorway. Automobiles are required to be emptied of their gasolene for transportation on some ferries and railroads. Experience proves that a full tank of gasolene presents no danger of explosion, while an empty tank, containing only gasolene vapor and air, has great explosive possibilities. The probable ground for demanding the emptying of the tanks, however, is that in case of collision the full tanks might be punctured and give a too ready flow of fuel if fire were present While the presence of gasolene in garages is the subject of special regulations and permits, yet a Massachusetts jury recently decided that no permit is required, no matter how great the amount of gasolene, provided that it is kept in the tanks of the cars themselves.

Policies on cars, which have been made a specialty by several companies, are examples of ingenious construction, and the methods of determining the risk are as yet very arbitrary. Among the latest proposals is the suggestion that risks should be calculated largely according to the make and model of the machine to be insured, it being claimed that certain makes, by reason of their strength and the superior arrangement of their fuel tanks, together with their very sparing use of wood, are entitled to a lower rate than others where

Digitized by Google

the tanks are more exposed and the body work is chiefly wood. It is even claimed that tabulated lists of the losses in the past disclose some makes as being far less liable to fire damage than others.

The clause exempting the insurance companies in cases of "fire originating within the vehicle" has been the subject of much recent litigation where machines have burned on the road as a result of collision, the spilled gasolene taking fire from the lamps. With but little variance in the circumstances, the courts have decided both for and against the policy holders, respectively, so that in situations of this kind the holder of a policy can have no certainty as to how he will fare.

The apprehensive way in which the different phases of automobile fire insurance have been taken up by the companies and their agents, resulting in high rates and arduous exactions, has not as yet changed to a broader method such as obtains in the older and familiar lines. With the exception of the work done by Clarkson in representing the Association of Licensed Automobile Manufacturers before the National Fire Protective Association and some of the rate making bodies, and the interest taken by the American Motor Car Manufacturers' Association, little organized effort has been made by the interests most affected, to get as favorable terms as might be obtained by a united and determined resistance to premiums based on fear rather than fact. For the insurance companies it may be said that they have been obliged to tackle the subject as best they could, with very little enlightenment or assistance from the automobile industry, the result being that whatever the industry has failed to contribute in information it has paid for in money.

Substituting Motor Cars for Milk Trains.

Wherever the transportation problem is proving particularly troublesome, handlers of large volumes of merchandise are learning to grasp the possibilities of the motor vehicle, and it is significant that where such efforts are made in a careful and thoroughly practical manner, the experiment seldom proves unsatisfactory. A recent instance in point is the adoption of a trial equipment of motor trucks by the German Milk Dealers' Association. Just at present wholesale milk deliveries are badly disorganized as a result of delays to trains which are often sidetracked, or even lost to the schedule, while the big dairy centers are so far off the railway lines in some instances as to occasion tremendous losses through slow haulage to the shipping points. A double equipment consisting of two heavy lorrys and trailers, is to be put to work, with the expectation that it will be able to move no less than 5.000 gallons of milk per day over its route between Anhalt and Berlin. If it proves successful, a proposal to adopt the same method in all the big German milk centers will be made.

NOW ONE OF THE BIG INDUSTRIES

Reeves Presents Figures Showing Growth of American Automobile Interests—Demand Equals Production.

From time to time there are launched at the heads of the reading public sundry figures as to the magnitude and prosperity of the automobile industry, many of which, it is sad to relate, are without proper backing of authenticity. Of the two most complete sources of reliable data on this subject, however, one was tapped last week, when on the occasion of the opening of the new term of the school of automobile instruction which is maintained by the Young Men's Christian Association in New York City, Alfred Reeves, general manager of the American Motor Car Manufacturers Association, discussed the strength of the industry by way of encouraging a swarm of potential candidates for positions in its numerous branches.

"It is estimated," he said in part, "that the present capital of the automobile business is about $105,000,000, with an additional $36,000,000 in kindred trades, and $57,000,000 more in garages and retail sales rooms, making a total of $198.000,000. According to latest figures obtainable, there are 58,000 employes in the automobile factories in this country; about 29,000 employed indirectly in the making of parts, while there are 21,500 in the sales and garage establishments. This gives a total of more than 108,000 employes.

"The records at the office of the American Motor Car Manufacturers' Association show that there are in this country 253 builders of automobiles, of which at least 123 are beyond the experimental stage, and are placing practical cars on the market. There are not less than 500 different trades involved in automobile manufacture, running from leather, varnish, broadcloth and buttons, to steel, brass and rubber.

"Although the importation of automobiles is fast decreasing, it is a fact that some $28,000,000 worth of foreign cars have been sold here. The trend is now going the other way, and the export trade of the American maker is increasing rapidly. It doesn't take very much of an imagination to figure that with our business methods, our unexcelled mechanics, our wonderful automatic machinery and our perfect factory systems, America will continue its lead in motor car building, both here and abroad.

"With 52,000 cars as a conservative estimate for this year, it is safe to say that 175,000 automobiles have been sold here during the past eight years. They are big figures, but it is a big industry.

"During the past year 13,980 cars have been registered in New York City alone, making a total registration since the law went into effect of 63,338 cars. Above all, and of great interest to those about to enter the trade, is the fact that 9,386 new chauffeurs were registered during the current year. One cannot be a pessimist on the automobile's future in the face of such figures. . . . .

"Factory reports indicate a tremendous production in motor cars for next year, running from machines that range from $150 for the school boy to $11,000 cars for the luxury-loving and speed-fascinated millionaires. . . . . Yet there is no reason to believe that next year will see an overproduction, provided good cars are made and sold at reasonable prices. The tremendous buying power of this country is evidenced in a score of ways, and particularly by the absorbing of motor cars during the past two years. Possibly next year's production will reach 75,000 cars. Yet we well know for the past five or six years a million buggies a year have been made and sold by the carriage people. Just what becomes of them no one has been able to say, but the buggy manufacturers continue to turn out these great quantities of horse-drawn vehicles. They are now turning their attention to motor vehicles, for the farmer is demanding the more modern type, for which he is quite ready to pay the price. One of the largest concerns of agricultural machinery plans to make 20,000 cars next year, yet this will hardly give them one apiece for their agents throughout the world.

"Taxicabs are fast coming into use, and there is hardly a city of tny prominence throughout the country which will not have occasion to use them. . . . . Last Year, in Paris, I was told that some 3,500 cabs were in use, which now has increased to almost 5,000. There are 1,500 cabs in London, and the number is constantly increasing. . . . . Last, but not least, we have the unlimited field of the commercial vehicle. . . . . As there will be no horses to take up room, and as they will carry twice the load and travel at twice the speed, it will be like widening the streets threefold."

How Racing Consumes Lubricants.

Some idea of the quantities of lubricant which are used in connection with the running of a great racing event such as the Vanderbilt Cup contest, may be gained from standing quietly on the lee side of the course while the competing cars roar by. A more definite idea, however, may be gained from the statement of one well known manufacturer who contributed to the success of the contest in question, that the nine makers who used his product took delivery of an average quantity of about 100 gallons each. The fact that the total deliveries at the various training camps along the course, amounted to more than 900 gallons, gives an inkling as to the probable outlay involved in this as well as other respects, in contests where the feature is great speed.

22,000 MILES WITHIN 24 HOURS

How Chalmers-Detroit Made Remarkable Election Day Record—Non-Stop Run Covers Many Cities.

Twenty-two thousand miles within 24 hours is the remarkable Election Day achievement which must be set down to the credit of the Chalmers-Detroit "30" car. It was run under "non-stop" conditions and further distinction must be added to the performance by the fact that though the accomplishment of this tremendous mileage would require an apparent average speed of about 916 miles per hour for the 24 hours. theoretically at least, not a single speed law was broken. The apparently paradoxical result was as a mater of fact, brought about by the ingenious device of allotting the task to about 108 demonstrating cars located in as many agencies throughout the country. Though each of the cars went but 200 miles or a little more, the total was a creditable performance for the car as a class, since all machines were duplicates; and the "record" is fully as legitimate as many that have been held up for distinction as 24 hours track performances.

All of the cars in their respective cities, carried disinterested observers, in most cases members of the press, to note the performance of the machine at all times. The self-imposed conditions were that not one of the motors should be stopped throughout the distance and that no repairs should be made to the cars, other than tire work.

In New York, the car from Carl Page's garage with William Knipper at the wheel, made an early trip to South Norwalk, Conn., and several subsequent runs to Yonkers and Mount Vernon. A Motor World man who was carried as observer for a good portion of the trip, was able to report that that particular car "ate up" its 201 miles with remarkable smoothness, more than justifying the claims of its makers in respect to power and speed. Twelve gallons of gasoline were required for the run, an average of 16¾ miles to the gallon, and the quantity of lubricating oil was limited to 3 gallons. No adjustments were required, and judging from the limited sections of the performance witnessed, the entire 22,000 miles must have been accomplished with little or no effort. Interesting disclosures as to the actual totals of distances, consumptions and costs are promised in a complete report of the undertaking soon to be issued.

Jackson, Mich., Greets Bangor, Me.

Carrying greetings from the Mayor of Jackson, Mich., to the Mayor of Bangor, Me., a Jackson touring car with F. L. Homes, general manager of the Jackson Automobile Company and three companions, is making a "non-stop" run between those two cities. The start was made on Monday, October 24, and the route laid out includes Detroit, Toledo, Cleveland, Buffalo, New York and Boston, a distance of 1,600 miles. Latest reports state that the car passed through Rochester in good shape, in spite of continuous rain and bad roads. The engine had not been stopped up to that point, according to observers, chiefly newspaper men picked up along the route. This car is the 1909 model "H" four-cylinder, 30 horsepower type, having a 4½-inch bore, 4½-inch stroke, motor rated at 30 horsepower, three speeds selective change gear, multiple clutch and bevel gear drive. It has a wheelbase of 110¼ inches and weighs with its five-passenger body, 2,400 pounds.

How Maxwells Parked at the Cup Race.

Among the numerous parking arrangements provided at the Long Island Motor Parkway in connection with the Vanderbilt Cup contest of last week, perhaps none was

more elaborately carried out than that of the Maxwell-Briscoe Motor Co., which included in addition to the space provided for the cars, lavish arrangements for the entertainment of the guests. Quite an interesting feature of the scheme, however, was the use of electric lights for illuminating the space and the tent. Current for this purpose was derived from a private and isolated plant.

While there is nothing particularly novel in the use of automobile engines for power purposes, even when they are utilized without being removed from the chassis, the production of current for electric lighting purposes in such a way as this is rather out of the ordinary. As will be seen from the picture, the arrangements were neither elaborate nor difficult to provide.

For the transportation of the mails between the various postal sub-stations and the railway in Nuremburg, Germany, three 16 horsepower, and six 28 horsepower vans are to be put in service on the first of next month.

FIXING FOR MEDDLESOME VISITORS

Innocent Tricks that are Better than "Hands Off" Cards—Indiscriminate Handling Rendered Harmless.

Preparing an automobile for service as a show car on the salesroom floor involves many little tricks of the trade. One of these consists in loosening the steering gear mechanism so that the steering wheel has considerable back lash and can be turned freely for quite a distance without communicating any motion to the knuckles or the front wheels. The reason for doing this, as given by the demonstrator for a New York salesroom, is that the majority of people who come into a salesroom to see a new car always give the steering wheel a yank or two, and a loosening of the mechanism saves a great deal of unusual and unnecessary strain, besides giving us a loophole for arguing the merits of the car.

"Few people can resist the temptation to handle the steering wheel," he said, "and when a machine is standing still it takes considerable effort to make the front wheels turn. In standing beside a car and tugging at the steering wheel nearly everyone will pull with all their weight if the wheel does not turn easily. Of course, this brings an awful stress on the pillar and the connections. Strangely enough if the wheel be loose enough to turn easily, most of those who take hold of it are satisfied, even if it does not turn the front wheels. Once in a while somebody will comment that there is considerable play, but it is easy to show that it exists for a purpose. In fact that very opening permits us to expatiate on one of the particular points about our steering gear and to make clear how our construction makes it possible to effect a perfect adjustment of the gear no matter how much wear it has.

"Everybody likes to handle the change gear mechanism, too," he added, "and in order to make it is easy and satisfactory for the experimenters we generally try to arrange the lay of the gears so that changes can be made just as the car stands. An easy shifting of the gears creates a very favorable impression with many people. There is an art in preparing a car for showroom purposes. To keep the machine looking well it must be roped off to prevent anyone sitting in the front seats but must be free in access to the tonneau. Small pads placed at suitable points along the running board will protect the latter from the wear of dirty shoes and boots that rest on it as their owners lean against the car and discuss its merits. Unless a car is properly prepared and looked after, two weeks in a busy showroom will do it more harm than two months of ordinary service."

GRAND JURY URGES IMPRISONMENT

Drastic Presentment Made to Kings County Court—Stricter Enforcement of the Automobile Law Demanded.

Declaring that from facts presented to them it would appear that the motor vehicle law is constantly being set at defiance and that violators are not adequately punished, the Kings County Grand Jury in a presentment handed up to Judge Dike in the County Court in Brooklyn early this week, recommended a more strict application of the clause prescribing the penalty of imprisonment. This phase of the law has been allowed to become a dead letter, it was claimed, with apparent hostility.

"Our attention has been called to the fact that the press of this county are continually reporting cases where the residents are being maimed, injured and killed in the streets of our great city, as the result of constant violations of the Motor Vehicle law," says the presentment.

"We called upon the Clerk of the Court of Special Sessions to appear before us and supply data showing the findings of that court in such cases covering the period from September 1, 1907, to September 30, 1908, with the following result:

"During that time 416 cases came before that court for violation of said law. The court appears to have inflicted a fine of $50 in four such cases, a fine of $25 in 11 cases, a fine of $20 in 11 cases, a fine of $15 in one case, a fine of $10 in 15 cases, acquitted 15, dismissed 30, sentence suspended on 126, bond forfeited on two, for motion 26, trial date, 125; total, 416.

"You will note from the above that not a single offender appears to have been punished with imprisonment as a result of having violated that law.

"The findings of that Court appear to prove conclusively to us that the law in question has been allowed to become a dead letter. The lives of our citizens being in constant jeopardy as the result of such violations, we would recommend that the spirit of the law be revived, and that in flagrant cases or where a person has become an habitual offender that the culprit be punished with a sentence of imprisonment. Where a chauffeur or owner is found to be a frequent offender we would recommend that they not only be sentenced to prison, but that in addition to this that their license be revoked."

Dynamiting of Scorchers Suspected.

Dynamite traps to blow up speeders are thought by the Chicago police to be in existence in the Windy City's suburbs. A big red touring car was blown to atoms a short time ago, and no traces of the three men occupying it could be found. The only clew to the identity of the machine was the license tag, bearing the number 2923 Illinois, registered in the name of a Chicago millionaire. The latter had taken his car from the garage the night before, and his continued absence lends support to the police theory that he met death in a dynamite speed trap.

Rochester Club Urges Careful Driving.

"Drinking and driving a car should not be indulged in on the same day; if you must drink, do your driving in a hack," says Secretary Van Tuyle, of the Rochester Automobile Club, who thinks he ought to know. Van Tuyle's sentiments were expressed in connection with a resolution passed by the club on Saturday, 24th ult., regarding stricter observance of the traffic ordinances. The resolution urges members to slow down before turning corners; not to dart ahead of vehicles in a crowded street, and to stop or slow down when appoaching persons who appear to be confused, et cetera. It is insisted that if members will follow the suggestions outlined, fewer accidents will be reported. What the resolution did not say about looking upon the wine when it is pink, led the secretary to cover this ground himself.

Learning How to Stop the Car.

As his first and most important rule of automobile safety for inexperienced drivers, Winthrop E. Scarritt proposes: "Learn to stop your car." The rule is meant in a deeper sense than merely to know how to stop the car. As Scarritt explained in an address at the opening of the Y. M. C. A. Automobile School, in New York City, last week: "The young driver should repeat over and over again, What shall I do to stop quickly? Push out that clutch, pull on that brake. By constant repetition and practice one learns finally just what to do without lacking time to think. You have all day in which to start your car; your life may depend some day on how quickly you can stop it."

Oil Drippings May Cause Lawsuit.

Oil that dripped from automobiles upon the pavements at a prominent corner in Utica, N. Y., is alleged to be the cause of a horse's death recently, and the owners of the horse are threatening to sue the city for contributory negligence in not enforcing the ordinance designed to prevent machines from dripping lubricants on the roadway. The horse slipped on the oily pavement and broke its leg, so that it had to be killed. The prospects of suit have stirred the police to a strict enforcement of the ordinance.

Court Finds New Form of Insanity.

When a man gratifies his love of automobile rides by renting machines when he cannot afford it, he is held to be insane by the courts in Cleveland, O. A traveling salesman, Ellis Fischer, has been sent to Cleveland's insane asylum as a result of a mania in this direction.

BUFFALO RIGIDLY ENFORCES LAW

Prosecutions Under the "Lights" Section Develop Some Interesting Points—Status of Idle Cars.

Motorists of Rochester, N. Y., are more or less exercised just at present over the administration of that section of the state automobile law which relates to the use of lights at night. George J. Bauer was arrested last week charged with neglecting to show a red light on the rear of his car. When stopped by patrolmen Louth and Niedert, he said that as all of the lights on the car were burning when he left the garage he supposed they were still in proper order. The officers, however, claimed that they could not see the tail-light because the bulge of the tonneau cut off its rays. When fined by Judge Chadsey in the police court, Bauer gave notice of appeal. The case is the outcome of a campaign of special activity recently undertaken by the Rochester police in enforcing the lamp law. In addition to the question of the position of the lamp as determining whether or not the motorist is complying with the legal requirement, another point which developed in connection with other cases brought simultaneously with that of Bauer was as to whether a car standing in front of its owner's house is in use, technically speaking. One owner when brought into court, contended that he had to extinguish the light on his car to keep children away, and that as it was stationary no lights were required.

Massachusetts Association Chooses Bliss.

Members of the Massachusetts State Automobile Association, at a meeting held last week, elected officers for the ensuing year. A. E. Bliss, of Malden, is to be the next president; A. D. Converse, of Winchendon, vice-president; John C. Kerrison, of Boston, secretary. For the latter office, a number of the members wanted to elect the present incumbent, James Fortesque, but he flatly refused to accept the re-nomination. Chairmen of committees were selected as follows: Legislative, A. D. Converse; Good Roads, A. D. Chase; signboard, John P. Coghlin.

Middlesex County Motorists Form Club.

New Brunswick, N. J., boasts a new motor organization—the Middlesex Automobile Club, which was launched with 24 charter members last week. Its wheels were set in motion by W. C. Crosby, acting president, and H. A. Bonnell, secretary of the Associated Automobile Clubs of New Jersey, and it will be represented in the councils of the latter body as well as affiliating with the A. A. A. in the near future. L. A. Voorhees, of New Brunswick, was appointed temporary chairman, and Arthur W. Clark, temporary secretary.

ADAPTING SHIPS TO MOTOR CARS

More Room 'Tween Decks Made Necessary by Increase of Automobile Touring—One Line Meets the Demand.

That the greatly increased use of American cars by motorists touring abroad has made it necessary to alter the arrangements of the steamers of at least one of the great trans-Atlantic lines is the surprising fact disclosed by a letter from the designing and construction department of the line in question to a prominent American maker who is credited with producing from 30 to 40 per cent. of the cars which are used in this way. The steamship company states that when Americans first began taking their cars abroad for touring purposes, they were content to land at Southampton, Cherbourg or Bremen. Now, however, many prefer to land in Italy and then tour northward, embarking for the homewtrd voyage from one of the northern ports. The distance between decks of this company's Mediterranean steamers was not sufficient to care comfortably for the crates used for the large suburban or entirely enclosed cars and now on all steamers of their line the distance between decks has been increased nine inches. This additional space will allow easily for the largest enclosed cars.

Compels Trip from Coast to Coast.

In a courageous and, thus far, apparently successful effort to regain lost health, Mr. and Mrs. H. A. Hover of Hover, Washington, two members of the Spokane Motor Club, arrived in New York City yesterday (Wednesday) after a long trip from the Western Coast in a 2 cylinder Maxwell car. On April 11 last, the outset of the tour, which is to take them around the globe, Mr. Hover dipped his tires into the Pacific Ocean at Tiajuana, a small Mexican village, and upon reaching the Metropolis, waded the car into the Atlantic, joyously completing the first long lap of the expedition, made entirely under the car's own power.

From New York the Hovers will sail for Algiers and penetrate through Egypt and Tunis, into the Sahara Desert and thereafter tour every country in Europe, and a good part of Asia, until the winter of 1911, when the homeward trip will be commenced, taking in the Philippines, Australia, New Zealand and Hawaii, motoring whereever possible. From the latter place they will sail for San Francisco in the winter of 1912. It is expected that more than 75,000 miles will have been covered by that time.

Motor Plow for Army Entrenchment.

One of the most recent acquisitions of the French War Department is a motor plow destined for use as a trench excavator for use in field manouvers. While ordinarily horse-drawn, when in action it is propelled by its own power, a 100 horsepower four cylinder motor being used for the purpose. A very heavy fly wheel which is driven directly by the motor carries four steel blades which perform the function of excavators. Other elements of the device are a plowshare, spades and a harrow. The system is the invention of a young engineer named Riester.

Helping Their Mail Carrier Buy a Car.

Instead of saving his pennies to buy a machine for himself, a negro mail carrier on rural route No. 1, of Argenta, Ark., has hit upon a much better scheme, which consists of having his patrons buy it for him. Two months ago the carrier, F. W. White, made a demonstration run in a motor buggy and completed the delivery on his whole route inside of three hours, where his horse and wagon method takes a day. Following this he mailed a circular letter to everyone on the route, asking them to contribute toward the purchase of the buggy, in return for which they would benefit by the improved service. So far he has received $475 and only needs $100 more to buy the vehicle.

Peanut Crop to Boom the Motor Car.

Peanuts, which long have been used as an example of cheap insignificance, loom up with considerable importance in the automobile business of Texas, according to W. F. Reynolds, southern representative for the H. H. Franklin Mfg. Co., of Syracuse, N. Y. "In Texas," he explains, "the forecasting of business for the coming season is now based to quite an extent on the outlook of the peanut crop. In one section a yield of 150 bushels per acre is reported, giving the peanut a lead over all other crops in that vicinity. If the peanut crop is good, the automobile business will feel the resulting prosperity."

Automobiles for Funeral Corteges.

Because San Antonio's graveyards are almost full, a new cemetery has been laid out, some distance from the Texas city. It is difficult of access, however, because the street car company has refused to extend its tracks to the new location, and so Mayor Bryan Callaghan has called upon all the automobilists of the city to assist whenever there is a funeral to the new place, by renting their cars to the mourners at a fixed rate. Being made as a call to civic duty, the mayor's request has met with a ready response.

More Municipal Cars for Chicago.

Three new Mitchell cars have been purchased for the use of the Building and Boiler Inspection Departments of the city of Chicago. Comptroller Walter L. Wilson ordered these purchases after a personal inspection of the company's factory, although he had been urged by his city hall associates to buy higher priced cars than those he selected.

INTERNATIONAL BUREAU OF ROADS

Paris Congress Establishes Permanent Body to Collate Information—Next Congress to Meet in 1910.

Aside from a bulky set of resolutions indicating the consensus of opinion as to the best methods of treating the problem of highway construction, the most important outcome of the recent International Roads Congress in Paris was the establishment of a permanent international bureau comprising one or more delegates from each country represented in the congress which will enable the results of the experience of road engineers the world over to be collated and put into useable form. In connection with the resolutions emphasis was laid upon the necessity of using great care in the construction of foundations.

A layer of concrete from four to six inches thick is especially recommended in the resolutions. As for the road itself, it should be composed of homogeneous materials which are hard, tough, resisting and not slippery. The use of tar, bituminous products, and deliquescent salts are effective for reducing the dust, but at present the results are far from permanent, and further experiments with these and similar compounds are invited. Tarring, properly carried out, is declared to be a remedy against dust, and to a certain extent a preservative against the wear and tear caused by all traffic, especially by fast motor vehicles. As for the plan of mixing the tar with the road material, no definite opinion was announced. Where motor traffic is not very heavy, it is considered that the present system of road making is sufficient, if it be carried out carefully and with proper materials. Roads should have the least amount of camber possible with easy drainage of rain water. The outside of curves should be slightly raised, and there should be no obstruction to the view at curves or at the intersection of roads. A uniform system of marking distances should be devised, and for the benefit of international automobilism a uniform system of road signals should be adopted. These should be limited to four kinds, respectively warning against obstruction, including dangerous hills, corners, level crossings—by night as well as by day—and dangerous cross-roads. It was resolved that the next Congress shall be held in Brussels in 1910. Incidentally, it was the general opinion that the automobile movement should not be censured for causing excessive road wear. As responsible for new traffic conditions, it was decided that where necessary, new methods should be devised to meet them.

Seventeen Cents a Day

Buys an Oliver Typewriter!

This amazing offer—the New Model Oliver Typewriter No. 5 at *17 cents a day* is open to everybody, everywhere.

Is's our new and immensely popular plan of selling Oliver Typewriters on little easy payments. The abandonment of *longhand* in favor of clean, legible, beautiful *typewriting* is the next great step in human progress.

Already—in all lines of business and in all professions—the use of *pen-and-ink* is largely restricted to the writing of *signatures.*

Business Colleges and High Schools, watchful of the trend of public sentiment, are training a vast army of young people in the use of Oliver Typewriters.

The prompt and generous response of the Oliver Typewriter Company to the world-wide demand for *universal typewriting*, gives tremendous impetus to the movement.

The Oliver, with the largest sale of any typewriter in existence, was the logical machine to take the initiative in bringing about the *universal use* of typewriters. It *always* leads!

Save Your Pennies and Own an Oliver

This **"17-Cents-a-Day"** selling plan makes the Oliver as easy to **own** as to **rent.** A man's **"cigar money"**—a woman's "pin money"—will buy it.

Clerks on small salaries can now afford to own Olivers. By utilizing spare moments for practice they may fit themselves for more important positions.

School boys and school girls can buy Olivers by saving their **pennies.**

You can buy an Oliver on this plan at the regular catalog price—$100. A small first payment brings the machine. Then you save 17 cents a day and pay monthly.

And the possession of an Oliver Typewriter enables you to **earn money to finish paying for the machine.**

Mechanical Advantages

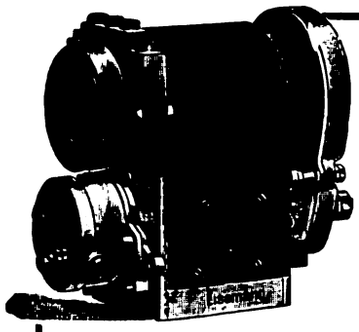
The Oliver is the most highly perfected typewriter on the market—hence its 100 PER CENT. EFFICIENCY.

Among its sources of conveniences are:

—THE BALANCE SHIFT
—THE RULING DEVICE
—THE DOUBLE RELEASE
—THE LOCOMOTIVE BASE
—THE AUTOMATIC SPACER
—THE AUTOMATIC TABULATOR
—THE DISAPPEARING INDICATOR
—THE ADJUSTABLE PAPER FINGERS
—THE SCIENTIFIC CONDENSED KEYBOARD

Service Possibilities

The Oliver Typewriter turns out more work—of better quality and greater variety—that any other writing machine. Simplicity, strength, ease of operation and visibility are the corner stones of its towering supremacy in



—CORRESPONDENCE
—CARD INDEX WORK
—TABULATED REPORTS
—FOLLOW-UP SYSTEMS
—MANIFOLDING SERVICE
—ADDRESSING ENVELOPES
—WORKING ON RULED FORMS
—CUTTING MIMEOGRAPH STENCILS

Can you spend 17 Cents a Day to better advantage than in the purchase of this wonderful machine?

Write for Special Easy Payment Proposition or see the nearest Oliver Agent.

THE OLIVER TYPEWRITER CO., **310 Broadway, New York City, N. Y.**

The Week's Patents.

894,676. Pneumatic Tire Protector. Rufus A. Mason, New Market, Iowa. Filed Sept. 9, 1907. Serial No. 392,019.

A pneumatic tire protector, comprising a series of plates having formed therein oppositely disposed apertures between which and the adjacent edge of the plate the metal is offset to form recesses or depressions on the inner sides of the plates, and a series of links adapted to be engaged to said apertures and depressed portions of the plates, whereby said links form projections or obstructions on the outer surface of the protector, while the inner surface of the latter is smooth or unobstructed, substantially as described.

894,709. Changeable Speed Gearing. Walter Scott, Sheridan, Wyo. Filed Nov. 26, 1907. Serial No. 403,892.

1. A changeable speed gear comprising a driven shaft, a plurality of concentric gear wheels secured to the said driven shaft, a driving shaft at a right angle to the said driven shaft, a plurality of normally loose pinions in mesh with the said gear wheels on one side of the axis thereof, a normally loose reversing pinion in mesh with one of the said gear wheels on the other side of the axis thereof, clutch mechanisms for engagement with the said pinions and mounted to slide on and to turn with the said driving shaft, shifting levers for shifting the said clutch mechanisms, pins fixed on sundry of the said shifting levers, spring-pressed swing arms pivoted on the remaining shifting levers, each swing arm carrying a pin, a controller shaft, and cam arms radiating at different angles from the said controller shaft and adapted to engage the said pins to actuate the corresponding shifting lever.

894,719. Gearing for Motor Vehicles. Frank Beemer, Philadelphia, Pa., assignor to Standard Roller Bearing Company, Philadelphia, Pa., a Corporation of New Jersey. Filed June 19, 1907. Serial No. 379,741.

1. In motor vehicle gearing the combination of a driven gear wheel, bearing supports for the same, and a pair of cam faced collars whereof one is pivoted with a latch and the other with teeth whereby the gear wheel may be shifted and held in proper position, substantially as described.

894,750. Road Vehicle Wheel. John Slee, Earlstown, Newton-le-Willows, England. Filed March 18, 1907 .Serial No. 362,985.

1. In a wheel, the combination with the felly, of a retaining ring on each side of and projecting beyond the felly, segments of compressible material between the rings and free to expand inwardly toward the felly and bolts passing through the felly and rings to cause the rings to laterally compress the segments, the inner faces of the rings which bear upon the segments being annularly grooved.

894,751. Tire Protector Holder. Frank O. Slanker, Pomona, Cal. Filed Dec. 20, 1907. Serial No. 407,317.

1. A tire protector comprising an annular rim provided with headed projections from its sides, opposite annular guard plates slotted to removably embrace said projections and extended inward to form a guard inclosing a portion of the spokes of a wheel intermediate of said rim and the hub thereof, and a yielding packing disposed at the opposite inner faces of the central opening in said plates to surround said spokes.

894,775. Sparking Device for Explosive Engines. Charles R. Greuter, Wilkes-Barre, Pa., assignor to Matheson Motor Car Company, Wilkes-Barre, Pa., a Corporation. Filed April 25, 1907. Serial No. 370,276.

1. A sparking device comprising a fixed and a movable electrode, a resilient spring connected to the movable electrode, oppositely disposed yielding members acting to hold the movable electrode normally out of contact with the fixed electrode, a cam located in operative relation to said spring, and means for shifting said spring to vary the time of contact of the cam therewith.

894,776. Vehicle Wheel. George H. Gruss, Goldfield, Nev. Filed April 18, 1907. Serial No. 368,871.

A vehicle wheel, comprising a hub having a cylindrical sleeve adapted to fit an axle, radial flanges at the ends of said sleeve, each of said flanges being provided with a row of perforations around its outer edge, two radial flanges surrounding the central portion of the sleeve, a resilient packing between said last mentioned flanges, an annular plate between said flanges and surrounding said packing, an inner tire shrunk upon the outer circumference of said plate, eyes carried by said inner tire, a plurality of spiral spring spokes connecting said eyes and the perforations in said first mentioned flanges, and an outer tire surrounding said inner tire and secured thereto, said outer tire having its outer surface provided with a plurality of grooves.

894,800. Power Translating Apparatus. Joseph Sachs, Hartford, Conn. Original application filed Sept. 19, 1903, Serial No. 173,801. Divided and this application filed July 2, 1904. Serial No. 215,092.

1. In a power translating apparatus, the combination with a prime mover and a driven member, of a generator armature, a motor armature, and means by which the shafts of said armatures may be connected whereby the driven member is always operated through the shaft of the motor armature.

894,958. Friction Drive Mechanism for Motor Cars. Charles C. Keyser, Washington, D. C. Filed Dec. 16, 1907. Serial No. 406,710.

1. The combination of a driving shaft and a driven shaft; a carriage slidable upon the driving shaft; a friction gear secured to said carriage; a friction gear secured to the driven shaft and adapted for contact with the first-mentioned gear; a pivoted arcuate guide connected intermediate its ends with said carriage; and means for swinging said guide bodily in one direction to impart a sliding movement to the carriage and the gear secured thereto, and withdraw the latter from contact with the last-mentioned gear.

894,980. Running Gear for Vehicles. George M. Phillips, St. Louis, Mo. Filed May 19, 1906. Serial No. 317,724.

In a running gear for vehicles, an axle; circular cushioned frames having concave peripheries; a circular pneumatic cushion mounted in the concave periphery of each of said frames; a suporting bar arranged above and parallel to the axle; housings carried by the supporting bar and concaved to register with the upper surfaces of the pneumatic cushions; projecting ears mounted upon the outer ends of the housing; a vehicle body; and springs upon which the vehicle body is mounted, said springs being supported by said projecting ears, substantially as described.

895,149. Universal Joint. Maurice E. Blood, Kalamazoo, Mich. Filed May 17, 1905. Serial No. 260,836.

1. In a universal joint, the two forks adapted to be secured to the ends of two shafts, the arms of said forks being perforated at right angles to the shafts; bushings for said arms; a cross formed by two pins, one passing through a hole crosswise through the other, the outer ends of said pins being journaled in said bushings in the forks, said bushings each having a threaded portion projecting beyond the face of the forks; and a grease cup, screw-threaded to fit each of said bushings, substantially as shown.

895,202. Compensating Gearing. David

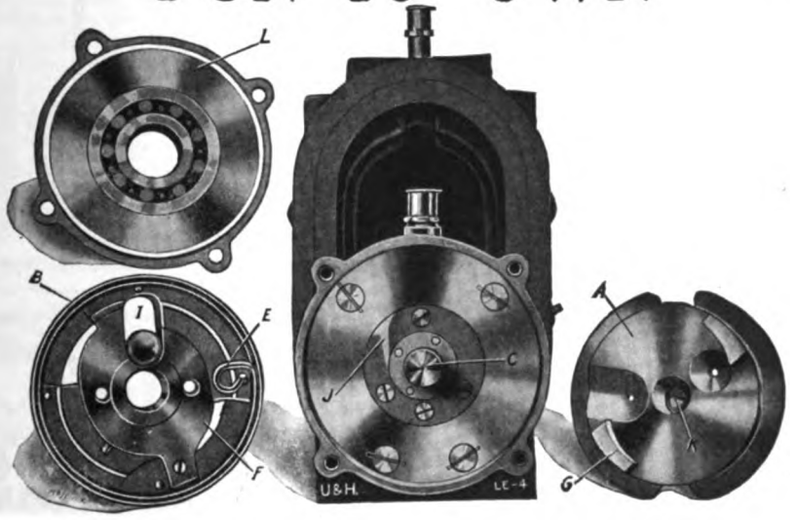
E. Ross Brookston, Ind., assignar to Ross Gear and Tool Company, La Fayette, Ind., a Corporation of Indiana. Filed Oct. 27, 1906. Serial No. 340,808.

1. In a device of the character described, a plurality of members, means common to said members for furnishing power for driving the same, means connecting said members whereby they may be driven at different speeds and devices for automatically increasing the driving torque of one of said members as the difference in their speeds increases.

895,205. Water Radiator for Automobiles. Charles F. Schell, Buffalo, N. Y. Filed Jan. 9, 1907. Serial No. 351,556.



1. A tube for radiators formed of a single piece of metal folded upon itself at opposite ends and thence bent at right angles to the folded ends into the form of a tube.

895,222. Multiple-Cylinder Two-Cycle Explosion Engine. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to The Winton Motor Carriage Company, Cleveland, Ohio. Filed April 13, 1908. Serial No. 426,875.

1. The combination with a multiple cylinder two-cycle explosion engine, of a single carburetter having a supply communication for each cylinder, and means for admitting air to said communications independent of the carburetter.

UNTERBERG & HELMLE

UNTERBERG & HELMLE

ACCESSIBILITY

reaches its highest development in the

Unterberg & Helmle Magneto

You don't have to imitate the India Rubber Man in the Dime Museum to get at the interrupter adjustment—you take the interrupter right out and adjust it at leisure. Undoing one screw takes it out, and you can't make a mistake in putting it back. The condenser is likewise removable by taking out the interrupter.

The distributer is disassembled by taking out three screws, and is cleaned by removing a spring-held cover.

The firing position is determined by inserting a removable pin through the armature casing. You can take the magneto off bodily and replace it yourself without fear of upsetting the timing.

Type LE—The SELF-STARTING MAGNETO.
Type LB—WITHOUT the self-starting device; used with separate battery system. Other types for special uses.

Will YOUR 1909 Cars Have The Remy Magneto?

If not, you will be with the minority.

Because more Remy High Tension Magnetos have already been sold for 1909 cars than all our competitors combined can sell. The total to date exceeds 15,000. There must be a reason for this remarkable popularity of the Remy. You will find it in the more than 15,000 Remy Magnetos now in use.

More Remy Magnetos have been sold to manufacturers for American-built cars in past seasons than all other magnetos together.

Years of test with all kinds of gasoline motors, under all kinds of conditions, have developed the Remy to the highest degree of efficiency and certainty. And it is the simplest magneto made. No brushes to cause trouble, wear out or be replaced.

We are the Oldest Manufacturers of Magnetos in America

Our magnetos were giving splendid service on motors, gasoline tractors, etc., long before the automobile became practicable. The Remy is used in the 200 h. p. gasoline electric steel cars manufactured for the Union Pacific by the McKeen Motor Car Co.

The Remy is used with the powerful engines that operate the big Gerling gangs of fourteen plows in the West. Its efficiency has been proved in many automobile contests, as for instance, by the Buick cars equipped with the Remy, at Lowell, Mass., on Labor Day, and at Indianapolis, Sept. 18 and 19; by the Cameron at the Dead Horse Hill Climb, Worcester, Mass., June 6th; in the Economy and Hill Climbing Contests at Baltimore, Aug. 8th; by Knox cars, equipped with the Remy, at Norristown, Pa., Hill Climb, June 27th; Arrowhead Hill Climb, New York, July 11th; Shingle Hill Climb, West Haven, Conn., May 27th; Rockville, Conn., Hill Climb, June 30th.

The Remy is used on all the Buick Motor Co., Maxwell-Briscoe Motor Co., Apperson Bros. Automobile Co., Overland Automobile Co., Cameron Car Co., Midland Motor Co., Nordyke & Marmon Co., Kissel Motor Car Co., Olds Motor Works cars—and more Remys are being specified every day for the cars of other makers. Write for illustration and full description of our new magneto. We build them in such large quantities that we can make you very attractive prices.

STEVENS-DURYEA

New Model X Limousines

A town car of the most luxurious type. Every detail suggests elegance and refinement. Among the points that contribute to its beauty of design may be mentioned the rounded back and extension front with bent glass windows, a combination giving those symmetrical lines lacking in Limousines not having these features. The luxurious upholstering and interior conveniences leave nothing to be desired in the way of comfort. A dome electric light with switch affords an instant and brilliant light, toilet cases with accessories are at each side, and a speaking tube connects with the driver. Seating capacity of body: five passengers.

PRICE COMPLETE, $3,750.

Locomobile

Establishes American Supremacy in Automobiles

Wins the Vanderbilt Cup

The Greatest International Road Race ever held in this country and the supreme test of reliability and endurance.

258 MILES IN 240 MINUTES

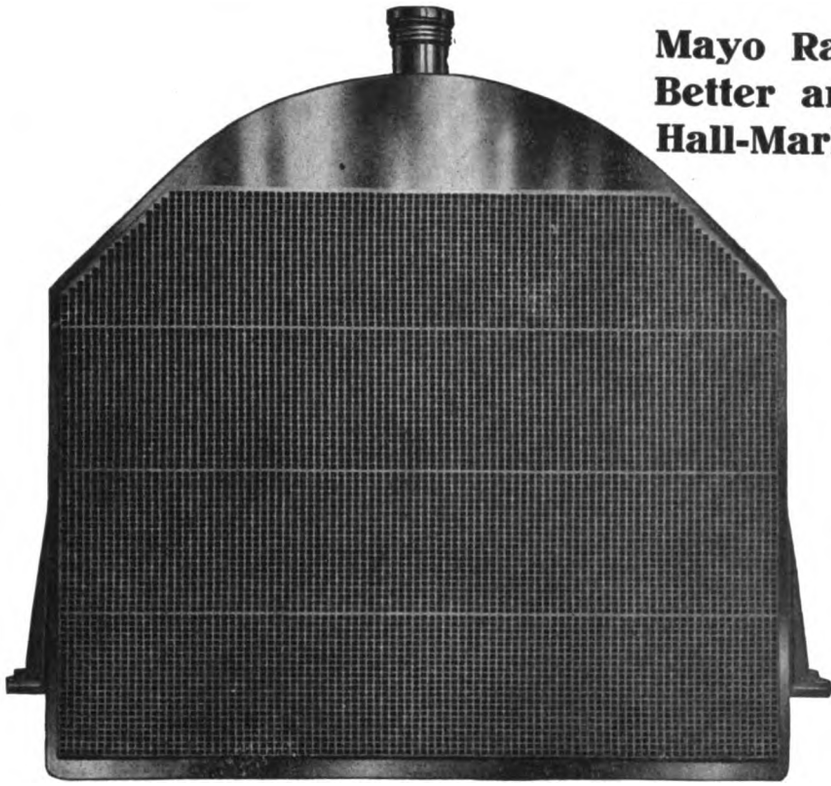
OVER A SLIPPERY COURSE

Locomobile No. 16 was first; Locomobile No. 1 would have finished in third place, but the race was called off after two cars had finished. At this unexpected announcement touring cars came out on the course, and as No. 1 Locomobile neared the Grand Stand on its last lap it came in collision with a car 25 YARDS FROM THE TAPE. The Cup Commission had notified the drivers before the race that five cars would be allowed to finish. Out of 19 entries, of which 7 were foreign cars, LOCOMOBILE RAN FIRST AND THIRD. Two cars placed. Something heretofore unknown in any contest for the Vanderbilt Cup. No trouble of any sort was experienced on either of the two cars except from the tires, which were of the anti-skid variety, necessitated by the slippery course.

Made the Fastest Lap

The Locomobile No. 16, driven by Robertson, made the fastest lap—23 45-100 miles—in 20 minutes and 17 seconds. It also ran 5 other laps in less than 21 minutes each. ITS AVERAGE SPEED DURING THE RACE WAS 64 3-10 MILES PER HOUR, INCLUDING ALL STOPS. THIS SMASHES ALL RECORDS FOR THE VANDERBILT CUP, no previous average reaching 62 miles per hour.

Both cars are of 90 h. p. and are substantially the same as our regular stock product, the difference being one of dimensions, so that the victory stands as a splendid triumph for Locomobile design and construction—a triumph for the Locomobile low-tension ignition system, the Locomobile magneto, the 4-cylinder motor, the selective transmission system and other features of the car. The material used in our regular product is everywhere as good and in some places even better than that used in the cars entered in the race AND WHICH WERE BUILT IN 1906.



The consistent performance of the two Vanderbilt Cup Locomobiles is but a repetition of the performance of the two entries in the great Founders' Week Stock Car Race in Philadelphia, October 10. This great race was won by a 40 h. p., 4-cylinder Locomobile, regular in every way.

Selden Motor Vehicle Co.

ROCHESTER, N. Y.

Member A. L. A. M.

Matheson

1909

Prices Reduced $1,000

And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for the best.

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still maintain the unequalled quality of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by doubling the factory output and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital has been increased by $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, at the makers' former prices to the agent or dealer; namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5 500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

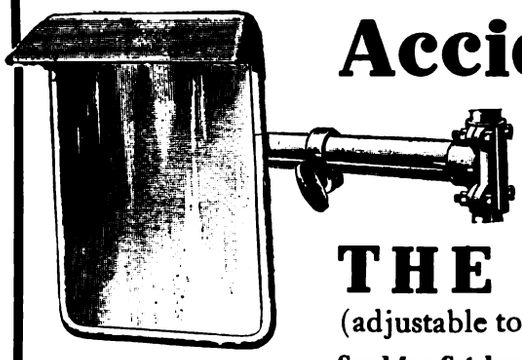
Franklin Automobiles

Certain manufacturers of water-cooled automobiles are advertising that light-weight is the greatest fallacy of the automobile age. In support of their contention that great weight is necessary in automobile construction, they compare their automobiles with railway locomotives and with Pullman passenger cars. This adds to the gaiety of nations.



H. H. FRANKLIN MFG. COMPANY
Makers of the light-weight, air-cooled Franklin Automobile.
Syracuse, N. Y.

Franklin seven passenger Model H, 42 H. P., six-cylinder, air-cooled motor, selective transmission, 127-inch wheel base, 36-inch wheels, Bosch high tension magneto. Finish, royal blue. Single or double rumble seat runabout, $3,600. Limousine, $5,000. Prices f. o. b. Syracuse.

The only light-weight large automobile. No other combines such extreme refinement and such flexibility of power with simplicity and great strength.

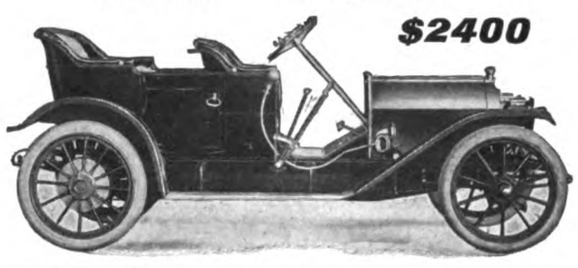
THE MARMON



"A Mechanical Masterpiece"

Marmon "Thirty-Two"

$2400

The Most Value Ever Offered In a Motor Car

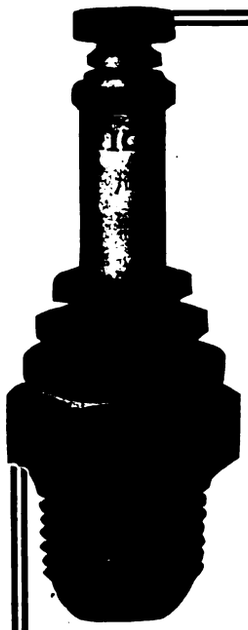
Before buying any car, take the detailed specifications and compare them—item for item—with the specifications of the Marmon "Thirty-two."

See what you actually get and what you pay extra for. Look at the size of tires and brakes, power, character of ignition, bearings, lubrication, etc.

You'll find that so-called cheap cars are not so cheap, and that no car at $3000 offers so much actual value as this car at $2400. Built as carefully as a fine watch, built to be durable and thoroughly dependable.

Genuine Krupp and Chrome Nickel Steel used in important parts. Bosch magneto and battery—dual system. Hess-Bright bearings. Weight (weigh it), 2,000 lbs. 32-40 H. P. Big Tires (34x4 all around). Fully equipped. Touring Car, Roadster, Four-Passenger Suburban with removable rear seat, or Limousine Town Car.

TO DEALERS: This car is a winner. Your competitors will have to take off their hats to it.



The superb Marmon "Fifty" (with Seven-Passenger or Four-Passenger Body), $3750.

The Value of the AJAX 5,000 Mile Guarantee

is known and appreciated by every individual **AJAX** user. It also finds substantial recognition at the hands of the automobile manufacturer who knows better than any one how vital the tire problem is to the motorist.

No wonder, then, that careful buyers and conservative manufacturers like the **Maxwell-Briscoe Motor Comapny** give to the **AJAX** the largest tire order ever received by a single tire firm.

Incidentally they give to their customers the benefit of the **AJAX five-thousand mile guarantee,** which insures the user against tire worry and gives him a security that no other tire maker can afford.

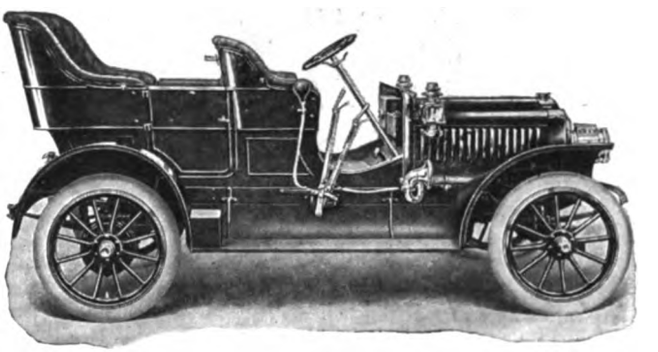
AUTOMOBILE FACTS

Will You Buy Dreams or Experience?

The car proved best in every test of moderate-priced automobiles— **THE MAXWELL**



The automobile universally recognized the reliable, durable, aristocratic, moderate-priced car, pre-eminent **THE MAXWELL**

The best equipped, the most extensive automobile manufacturing facilities now existing, are comprised in the three splendid factories, at New Castle, Tarrytown, Pawtucket, with floor area of over twelve acres with over $400,000 worth of equipment, with a capacity of 12,000 automobiles per annum—all founded on our confidence in the superiority of **THE MAXWELL**

Our output for the season of 1907-08 was over five million dollars—all represented by **THE MAXWELL**

In 1908-09 will be over eight million dollars worth of **THE MAXWELL**

We are proud of our success, and among the popular-priced cars, high and above all stands **THE MAXWELL**

THE FIVE-BEARINGS-MOTOR CAR
Maxwell Model DA, 4-Cylinder, 24-28 H. P., $1750

THE MAXWELL-BRISCOE MOTOR CO. never experimented on the public. Mr. Maxwell, instead of copying and skimping in his designs and producing a hodge-podge automobile, has created a true American car, for American roads and American touring conditions, with every possible regard to the demands of the average American motorist.

THE MAXWELL is the first and foremost utility car of America.

MAXWELL cars bought three, four or five years ago and in constant use since, are better cars to-day than the cheap freaks of even a year ago. Where are the two-year-old cars of some makes?

MAXWELL two-cylinder cars are the standard two-cylinder car of the world.

MAXWELL four-cylinder cars, the high-grade, moderate-priced car, has five main crank shaft bearings.

MAXWELL bodies are made of steel.

MAXWELL cars cost more to make this way, but they are five times as durable.

MAXWELL cars are of unit construction that no stress can unline.

The Maxwell-Briscoe Motor Company has found that it paid to have ideals, not to try to see how cheap it could make automobiles, but to make good automobiles, and sell them at a low price commensurate with small profits and a large output.

Advance literature now ready for distribution, showing complete 1909 line

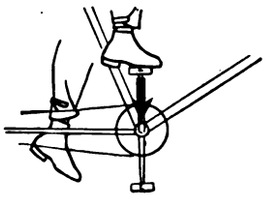
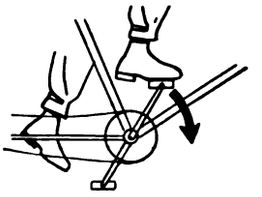
Rambler 1909

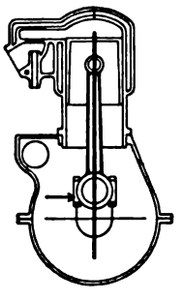


Model Forty-four, Price $2,250

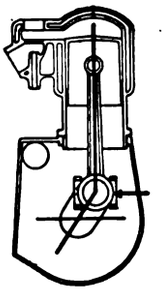


Spare Wheel, with Inflated Tire, Brackets, and Tools, $74

THE OFFSET CRANK-SHAFT



MOST automobiles develop sufficient power when they are traveling at a high speed. The greatest need is for power at slow engine speeds. Rambler Model Forty-four can be operated smoothly and steadily at three miles an hour on high gear. This is because of the offset crank-shaft.



Equivalent to position in ordinary engine of piston at explosion center. Illustrates energy wasted to overcome dead center.

Equivalent to position in Rambler engine of piston at explosion center. No energy wasted. Full power of explosion exerts turning effort to crank-shaft.

Ordinary engine Crank-shaft in line with connecting-rod, creating a dead center.

Rambler offset crank-shaft. Dead center eliminated.

How the Offset Crank-Shaft is an Advantage

Write for special information regarding the Rambler Spare Wheel, the offset crank-shaft, and other special Rambler features

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, November 12, 1908. No. 7

RE-ELECT A. L. A. M. OFFICERS

Northern License and Membership Transferred to E-M-F.—Record Attendance at Annual Meeting.

For the third time Charles Clifton has been chosen president of the Association of Licensed Automobile Manufacturers, together with Thomas Henderson as vice-president, and L. H. Kittredge, secretary. Colonel George Pope, who last summer succeeded H. H. Franklin as treasurer, was likewise re-elected to office, at the annual meeting held Wednesday, 11th inst., at the association's offices in New York City. One change was made in the executive committee, William E. Metzger being succeeded by G. H. Stilwell, the remainder of the committee being Charles Clifton, S. T. Davis, Jr., Thomas Henderson, and Herbert Lloyd.

Transfer of the Selden license and association membership of the Northern Motor Car Co., to the Everitt-Metzger-Flanders Co., of Detroit, Mich., which latter company has absorbed the Northern's business and property, was effected, thus dispelling such trade doubts and misunderstandings as may have existed concerning the E-M-F. company's relations with the association.

At the session, which was the most largely attended A. L. A. M. meeting ever held, numerous general and special reports were read and approved, and the show committee reported everything well advanced for the forthcoming Licensed show. During the day this committee gave a hearing to the motorcycle manufacturers' requests for more space. As an earnest of the association's interest in the good roads movement, S. D. Waldon was appointed the A. L. A. M. representative on the Good Roads Central Committee.

Those attending the meeting included: Elmer Apperson, Apperson Bros Automobile Co.; J. S. Clarke, Autocar Co.; W. C. Durant, A. H. Goss and C. R. Hatheway. Buick Motor Co.; W. C. Leland, Cadillac Motor Car Co.; Hugh Chalmers and R. D. Chapin, Chalmers-Detroit Motor Co.; M. S. Hart, Corbin Motor Vehicle Corp.; William E. Metzger, Everitt-Metzger-Flanders Co.; H. W. Nuckols and Herbert Lloyd, Electric Vehicle Co.; J. H. Becker, Elmore Mfg. Co.; H. H. Franklin and G. H. Stilwell, H. H. Franklin Mfg. Co.; E. W. Headington, Haynes Automobile Co.; E. R. Hewitt, Hewitt Motor Co.; A. N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Co. of America; Samuel Regar, Lozier Motor Co.; C. W. Matheson, Matheson Motor Car Co.; H. B. Joy and M. J. Budlong, Packard Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; Charles Clifton, George N. Pierce Co.; Col. George Pope, Pope Mfg. Co.; A. L. Pope, Pope Motor Car Co.; G. E. Mitchell, Alden Sampson Mfg. Co.; F. B. Stearns, F. B. Stearns Co.; A. H. Ackerman, Studebaker Automobile Co.; E. R. Thomas, E. R. Thomas Motor Co.; E. S. Church, Waltham Mfg. Co., and Thos. Henderson, Winton Motor Carriage Co.

The presence of W. C. Durant with two of his associates in the Buick company, despite the fact that the company is now being sued by the Electric Vehicle Co. for Selden royalties alleged to be due for the past year, was a matter of comment. The relations between the company and the association are described as being in "statu quo" for the present.

Pratt Joins the Pierce Forces.

J. Elmer Pratt, formerly associated with the Cadillac company and later with the Buick, has joined the organization of the George N. Pierce Co., of Buffalo, N. Y. His work will be in the sale and allotment of cars, a field in which he has had great experience.

Morse Resigns from Thomas.

E. C. Morse has resigned as commercial manager for the E. R. Thomas Motor Co., of Buffalo, N. Y. His resignation takes effect on the first of the year.

HOUPT TO HANDLE HERRESHOFF

Light Car at Popular Price is Promised—New York Thomas Agent to Undertake Its Sale.

The new Herreshoff car, made by the Herreshoff Automobile Co., of Detroit, Mich., is to come to New York under very favorable auspices, contracts having been signed with Harry S. Houpt under which the latter will handle it. Houpt is well known as the head of the H. S. Houpt Co., which has the Metropolitan agency for the E. R. Thomas Motor Co., while the Herreshoff company was organized last summer, to manufacture cars designed by Charles F. Herreshoff, formerly associated with the American & British Mfg. Co., of Bridgeport, Conn.

The forthcoming model is planned to be of the popular $1,500 order, having shaft drive, transmission mounted on the rear axle, and other features more or less common to this type. Houpt is said to have made tentative arrangements also with F. E. Moskovics, of the Bristol Engineering Co., for a large car to be made by the latter concern at its plant in Bristol, Conn., in accordance with designs to Houpt's special order.

Upon being asked for a confirmation of the details of his arrangement with the Herreshoff company, Houpt declined to commit himself. He indicated that he preferred to say nothing for the present.

"Do you deny the correctness of the news?" he was asked.

"Well," he replied, "I do not affirm it."

Castle Acquires an Atwood Interest.

F. E. Castle, formerly with Gray & Davis, of Amesbury, Mass., has again gone into the lamp business by acquiring an interest in the Atwood Mfg. Co., of Amesbury. As a result of the arrangement the name of the company will be changed to the Atwood-Castle Co., for the future.

In the Retail World.

Thomas Fassitt is building a garage and salesroom in Easton, Pa. He and his son will be the proprietors.

The Ohio Electric Car Co., of Columbus, O., has changed its name. It is now the Detroit Electric Car Co.

George P. Peterson has arranged to open a Buick agency in Joliet, Ill. It will be located at Clinton and Scott streets.

Milton Updyke's garage, on the Merrick road, near Seaford, L. I., was destroyed by fire on the 2d inst. His loss is about $5,000.

The Maple Place Garage Co., of Jamaica Plain, Mass., has opened an establishment in the rear of No. 4 Maple place. Bert Ross is in charge.

The Lone Star Auto Co.'s garage in Midland, Tex., has been totally destroyed by fire. The loss is estimated at $20,000, with no insurance.

J. W. Maguire, one of Boston's pioneer dealers, has taken enlarged quarters for the sale of Pierce cars. He is now located at 743-745 Boylston street.

Charles S. Howard will shortly open on establishment in Los Angeles, Cal., for the sale of Buick cars. His company has the State agency for the line.

Lee Richardson, a veteran automobile man of Redlands, Cal., is planning to open a store in Los Angeles. He will divide his time between the two places.

Daniel G. Meyer, formerly of Milwaukee, is opening a salesroom and garage at Green Bay, Wis., at Washington and Stuart streets. He will handle the Reo.

The Dietrich Motor Car Co., Franklin dealers in Allentown, Pa., are building a large fire-proof garage. The building will have a street front on three sides.

L. G. Martin, of Pittsburg, Pa., is adding a large fire-proof building to his present establishment at 3923 Forbes street. It will be equipped for garage service.

C. G. Layton, of Danville, Ill., has purchased property at 124-126 North Jackson street for his new salesroom and garage. The latter will have capacity for 100 cars.

Savannah, Ga., has been selected as a distributing center by the Studebaker Automobile Co., of South Bend, Ind. The Southern trade will be in charge of L. E. Ogden.

Following the opening of a New York branch, Gray & Davis, of Amesbury, Mass., have opened a Boston office for the sale of their lamps. It is located at 794 Boylston street.

Chicago headquarters for the Moline Automobile Co., of Moline, Ill., have been moved from Automobile Row. The new location is at 1220 Michigan avenue, where W. J. Boone is in charge.

Harry P. Branstetter, of 1337 Michigan avenue, Chicago, Ill., is to have charge of the Middle West distribution of Kisselkars for 1909. He has changed the name of his establishment from the Branstetter Motor Co. to the Kissel Motor Car Co.

The Weldon & Bauer Co., of Newark, N. J., has filed articles of incorporation, to do an automobile and garage business. The concern wil continue, as formerly, at 200-202 Halsey street.

W. H. Chase, plumber and automobile repairer, is fitting up a garage in Union Square, at Dover-Foxcroft, Me—the first in the twin towns. A complete repair shop will be a feature.

R. C. Hamlin, of Los Angeles, Cal., has under construction a large T-shaped garage on Olive street, a feature of which will be the entire freedom from supporting posts on the floor. The salesroom for the display of Franklin cars will have an area of 2,500 feet.

The American Locomotive Co., of Providence, R. I., has appointed Benjamin C. Day as manager of its Chicago branch, which will be located on Michigan avenue at Twelfth street, in the corner of the old Zion temple. In order to take the new position, Day resigned as Chicago manager for the Winton Motor Carriage, in which capacity he has been succeeded by J. F. Davis.

Show Luncheon and Headquarters.

The show luncheon of the American Motor Car Manufacturers' Association will take place at 1 o'clock, Tuesday, January 5, at the Hotel Manhattan. The hotel will be the Association headquarters during show week.

Burg Buggy Takes up Motor Cars.

The Burg Buggy Co., of Dallas City, Ill., has decided to make motor vehicles. Following the production of several experimental models the manufacture of quantities will be commenced very soon.

Organize to Make Automobiles.

The De Witt Motor Vehicle Co. has been formed to manufacture automobiles at North Manchester, Ind. The principal stockholders include Virgil De Witt, Mary J. De Witt and James S. Rose.

Hildebrand Visiting the West.

C. C. Hildebrand, general sales manager of the Stevens-Duryea Automobile Co., of Chicopee Falls, Mass., is visiting the western agents of the company. His trip will extend to the Pacific Coast.

Dale's Successor is Chosen.

To succeed the late Charles H. Dale as president of the Rubber Goods Mfg. Co., the choice has fallen on John J. Watson. He is also treasurer of the United States Rubber Co.

Havener with the Hartford Rubber.

L. C. Havener has become a New England representative for the Hartford Rubber Works Co., of Hartford, Conn. He will make his headquarters in Boston.

The Week's Incorporations.

White River Junction, Vt.—Miller Automobile Co., The, under Vermont laws. Capital, $5,000.

Indianapolis, Ind.—Marion Automobile and Manufacturing Co., under Indiana laws, with $10,000 capital. Corporators—Charles Rennaker, Frank Boyer and Clifford G. Rust.

Hartford, Conn.—Richardson Engineering Co., The, under Connecticut laws, with $10,000 capital. Corporators—D. A. Richardson, Victor F. Morgan, and P. L. Hewman.

Lynbrook, L. I.—Walton Motor Co., under New York laws, increase of capital from $10,000 to $20,000. Attorney—George F. Hickey, 78 Wall street, New York City.

Cleveland, O.—Zenith Motor Goods Co., The, under Ohio laws, with $25,000 capital. Corporators—J. J. Downey, L. B. Le Bel, K. C. Stewart, P. A. Iddings and A. S. Shearer.

Elyria, O.—Airless Puncture-Proof Tire Co., The, under Ohio laws, with $10,000 capital. Corporators—George E. King, B. Lighthall, W. J. Engel, S. C. Henderson and W. C. Marple.

Long Beach, N. Y.—Long Beach Garage Co., under New York laws, with $50,000 capital. Corporators—Dix W. Noel, William B. Davis and John Gerdes, No. 1 Broadway, New York City.

Plattsburg, N. Y.—Lozier Manufacturing Co., under New York laws, with $60,000 capital; to manufacture motors, etc. Corporators—John M. Weaver, George F. Tuttle and Samuel L. Wheeler, of Plattsburg.

Burlington, Vt.—Vermont Motor Co., under Vermont laws, with $5,000 capital; dealing and repairing. Corporators—F. A. Rich, Henry H. Hagar, Russell W. Taft, F. W. Chamberlain and Guy E. London.

Bucyrus, O.—Bucyrus Transportation Co., The, under Ohio laws, with $5,000 capital; to operate a motor transportation line. Corporators—C. R. Rowe, J. K. Myers, Jacob Bach, Charles Quantaine and F. A. Walther.

Codd is Fishing for a Site.

George P. Codd, a former mayor of Detroit, Mich., and at one time an official of the Northern Automobile Co., has been in Cincinnati, ostensibly seeking a site for an automobile factory. He indicated that a $250,000 company is being planned, to make light cars.

Cleveland Selects Its Show Date.

Cleveland's automobile show has been set for the week of February 15. It will be held in the Central Armory, under the management of a dealers' committee.

Digitized by Google

TO BE CHICAGO'S BIGGEST SHOW

Number of Pleasure Car Exhibitors Exceeds that of Last Year—List of Main Floor Spaces.

Spaces at the Chicago automobile show, which is to be held February 6 to 13, have all been taken, and the list of pleasure car exhibitors exceeds that of any of the previous years. Practically all of the prominent makers are included, together with a number of manufacturers who have never exhibited before. While last year the total number of exhibitors staging pleasure cars reached 90, the coming show will have 92, and there are quite a few on the waiting list, for whom provision will be made if possible. There will be at least 12 automobile exhibits in the basement of the Coliseum Annex, supplementing those already listed for the regular spaces.

The accessory makers are to occupy the galleries of the Coliseum and the Armory, the second floor of the Coliseum Annex, and a part of the basement. In this class there is a greater allotment than ever before. The motorcycle section is also to be an important feature of the show and will include 21 exhibitors, as against 11 in this class last year. The list of exhibitors of pleasure cars and motorcycles is as follows:

Coliseum—Main Floor.

Winton Motor Carriage Co., Cleveland, Ohio.
Pope Mfg. Co., Hartford, Conn.
E. R. Thomas Motor Co., Buffalo, N. Y.
Stevens-Duryea Co., Chicopee Falls, Mass.
Peerless Motor Car Co., Cleveland, Ohio.
Elmore Mfg. Co., Clyde, Ohio.
Woods Motor Vehicle Co., Chicago, Ill.
Thomas B. Jeffery & Co., Kenosha, Wis.
Babcock Electric Carriage Co., Buffalo, N. Y.
Baker Motor Vehicle Co., Cleveland, Ohio.
F. B. Stearns Co., Cleveland, Ohio.
Reo Motor Car Co., Lansing, Mich.
Packard Motor Car Co., Detroit, Mich.

Bendix to Build in Logansport.

After strenuous efforts to absorb $75,000 worth of the stock of the Bendix Automobile Co., the citizens of Logansport, Ind., are in joyful celebration of the fact that the Bendix factory is to be "in their midst." All but $3,500 of the $75,000 stock subscription demanded has been taken, and the Logansport Land and Investment Co., the local association of business men which seeks to draw manufacturers to the town, has secured a factory site for the company. The latter has generously indicated its willingness to "take a chance" on the small balance of the stock subscription being taken up in the near future, and will hereafter date its letters from its new address.

Truck Builders Seek Norwalk Capital.

The Commercial Truck Co., of Plymouth, O., has made a proposition to the Chamber of Commerce of Norwalk, O., which the latter body is seriously considering. If Norwalk will subscribe for $75,000 worth of the company's stock, the concern will move and build a big factory in the city. W. C. Gilder, general manager of the company, appeared before the chamber, together with A. M. Trego, and asa result of their statements a committee has been appointed to investigate the condition and prospects of the business.

Marseilles May Produce Motor Buggies.

Charles Keagle, of Kankakee, has been raising the hopes of the residents of Marseilles, Ill., by looking for a site for an automobile factory. Keagle is connected with the Waldron Car Mfg. Co., near Kankakee.

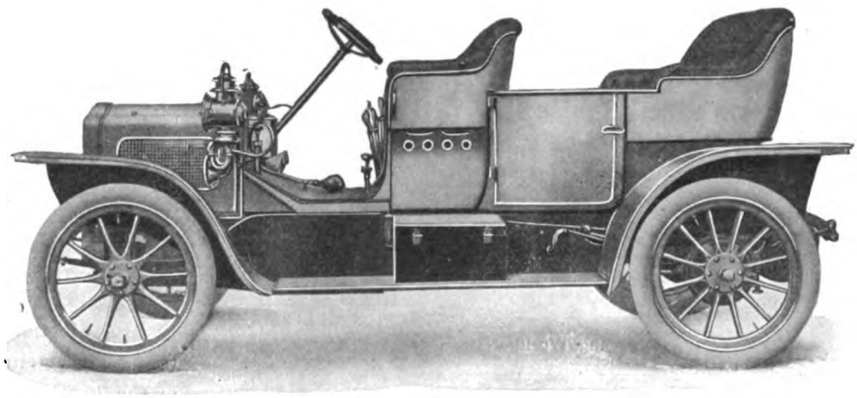
OPPOSES POPE RE-ORGANIZATION

Hearing Develops Objection from a Stockholder—Both the Hagerstown and Elyria Plants are Sold.

Opposition to the proposed reorganization of the Pope Mfg. Co., of Hartford, Conn., has arisen, objection to the terms offered by the reorganization committee having been made by Thomas H. O'Connor, of Jersey City, a stockholder, at a hearing on Tuesday, 10th inst., before Vice-Chancellor Howell, in Newark, N. J. The committee offers $1,500,000 for the assets of the company, exclusive of $800,000 cash in the hands of the receivers on August 1, the transfer to be post-dated to that time. In his objection, O'Connor wants the court to make certain that the committee's offer is the best that can be obtained. Following the hearing, the vice-chancellor announced a reservation of his decision until Thursday, 12th inst., but later set a date for a further hearing, which will be held on Monday, 16th inst., at which time the receivers and others will be examined under oath.

The sale of the plants at Hagerstown, Md., and Elyria, O., has been approved. For the Hagerstown factory the Pope company receives $57,500, while the Garford saddle factory at Elyria brings $35,000 to the Federal Mfg. Co., which the Pope company owns. Immediately the reorganization plan is consummated, the creditors will be paid their fourth and final dividend of 25 per cent. on approved claims, but should any material delay arise, which is at present unlikely, application will be made for the payment of the dividend without waiting for the completion of the deal.

Apperson Business is Incorporated.



The Apperson Bros. Automobile Co., of Kokomo, Ind., which has in the past been conducted by Elmer Apperson, has incorporated under Indiana laws, with $400,000 capital. It will retain its old name. Under the reorganization the following officers have been appointed: Elmer Apperson, president and general manager; Edgar L. Apperson, vice-president; and Alton G. Seiberling, secretary and treasurer. George H. Strout will continue as sales manager.

Still More Space for Firestone.

Not content with the expansion that will be provided by the new buildings and additions already under construction, the Firestone Tire and Rubber Co., of Akron, O., has made a further purchase, by which it takes over the plant of the Gloge Foundry & Machine Co., adjoining the present rubber factory. The property embraces several buildings and five large lots, which will be the site of another big structure in the spring.

A WHITE STEAMER FOR $2000!

Not since 1904 have we made a car priced at so low a figure as $2,000. The White—"the car in a class by itself"—has thus been brought within the range of a larger number of purchasers than has been the case in recent years.

The new $2,000 White car, known as our Model "O," has none of the attributes of the "cheap machine." It is simply a "smaller edition" of our $4,000 car. The new model "O" is rated at 20 steam horsepower, which means that it can do the work of gasoline cars rated at much higher figures. The wheel-base is 104 inches; the tires, both front and rear, are 32x3½ inches. The car is regularly fitted with a straight-line five-passenger body. The frame is of heat-treated pressed steel. The front axle is a one-piece forging of I-beam cross section.

The nature of the steam engine is such that the engine of small power has all the desirable attributes of the engine of high power. In other words, as the weights of our small car and of our large car are proportionate to the power of their respective engines, the small car can do anything that our large car can do

To summarize the features of our new Model "O" car—it is noiseless, odorless, smokeless and absolutely free from vibration. All speeds from zero to maximum are obtained by throttle control alone. The speed of the car responds instantly to the throttle; the engine can never be stalled. The directions for driving are summed up in the phrase, "Just open the throttle and steer." It starts from the seat—"no cranking." It is the ideal moderate priced machine. It is the best for the man who wishes to drive and take care of his own car. It is a result of our nine years of experience in building the White Steam Car—the only machine which finds a ready market in every portion of the globe.

Write for circular giving full details of this car.

Marketing the Multiple Product.

Much has been said of the advantages of manufacturing cars in big lots and of the benefits derivable from multiple production both in economy of construction and profit in marketing. But up to this time little or no discussion has arisen as to the relative advantages to the dealer of handling the larger cars, and those of medium and low prices which are built in great quantities. Superficially it would seem to be a question of a large pro rata profit on a small number of sales, or vise versa. Actually it appears that a number of other factors are involved which serve to render the question more complex.

Thus the small or medium car selling at a corresponding price, usually is sold fully equipped, or if with partial equipment offers only a limited market for accessories. Furthermore repairs are largely accomplished by replacing broken or defective parts which are strictly interchangeable so that the amount of labor involved in keeping cars of this class in order is considerably less than is necessary to the maintenance of the more luxurious types. Another point to be considered is that as the agent for the multiple product must handle a greater number of machines in his repair department than the agent for the more costly product, his facilities must be more ample. Again, the fact that the larger machine is usually cared for by a paid chauffeur while the less pretentious affair is more frequently attended to by its owner, also is noteworthy, as in the latter case not simply are the principles of economy apt to be more rigidly adhered to, but a greater share of the repair work is likely to fall on the shoulders of the dealer.

In a word, the profitable handling of the medium and low priced proposition depends upon principles similar to those which govern the production of machines of this type. It is not simply a matter of handling a large volume of business at relatively low profits on the individual machine, but also of handling all the details in such a systematic and expedient fashion that sources of waste shall be reduced to their lowest terms, costs cut to a minimum and the necessary fixed expenses distributed over the widest possible area.

On this account the dealer who has been accustomed to handling large, expensive cars and of catering to an exclusive trade, will find on turning to the "popular" type that a thorough reorganization of his methods must take place before he is enabled to realize the returns apparently promised by a given turnover. For such as are adapted to the administration of close and exacting systems, this transformation will be readily accomplished. To those who are not so constituted, the promised harvest will prove more difficult to garner.

Inferior Brakes on Used Cars.

Ample consideration is being paid by designers and manufacturers to the important question of fortifying the braking system against all possible weaknesses, and with effects which are certain to result beneficially to the industry as well as to the user. At the same time it has been overlooked in the flood of suggestion and advice which has poured in upon makers and dealers, that in the cars of older make a considerable source of peril exists because of their inadequate braking equipments, as well as from the fact that in many cases the owner or operator through long familiarity with the machine has become careless of its condition and has permitted the brakes to get out of adjustment to such an extent that they are little better than useless.

Indeed, from the standpoint of the man in the street, it is more important that the present owner be taught the proper care and handling of his brakes than that the manufacturer be advised to better the equipment of his newest product. The latter, with his own interest in view, and keenly alive to the requirements of the case may be depended upon from this time forward to take care of that phase of the situation. Users of old cars, on the other hand, outnumber those who drive new machines by perhaps four to one—the exact ratio does not matter—and though the proportion of those machines which are really dangerous in this respect is constantly decreasing, it yet constitutes a real menace to public safety.

Within the past few weeks a number of accidents attributable directly to improper braking have served to point the truth that the automobile owner must be made to learn the importance of keeping his brakes in as good relative order as his motor. Worn contact surfaces, faulty adjustments, worn connections, which are liable to give way at a critical moment, and most important of all, brakes which are not strong enough for their work; are points about which too many drivers require instruction. Their neglect means that every car answering to any such shortcoming is a potential source of accident, particularly in city use where it is quite as much a source of danger to the outside public as to the occupants of its seats.

Automobile clubs, dealers' organizations, groups of influential motorists from time to time have taken a hand in the suppression of current abuses of privilege which have tended to undermine the repute of the automobile. Here is an opportunity for a movement along similar lines, looking toward the safeguarding of their interests to a degree quite as important as those for the suppression of noise, glaring lights, reckless speeding. Incidentally it affects some of the oldest and staunchest supporters of all that is best in motoring practice, who still retain cars of several years use, which, however well constructed they may be in other respects, almost without exception

Digitized by Google

are weak in the braking equipment. On this account it should not be difficult to urge successfully the comparatively minor conversion involved in the complete renewal of present equipments or the substitution for them of more modern and reliable ones.

A Fault in Steering Wheels.

It is a comparatively rare experience for the driver to find that the rim of the steering wheel has suddenly separated itself from the spider and is lying idle in his hands while the machine is forging ahead without guidance. Yet this has been known to occur more than once, and several fatalities are chargeable to it, though the fact may have escaped the scent of the newspaper writers who are merely content to lay the blame to the steering gear and to omit a more rigid examination into the sequence of cause and effect.

It is easy enough to see how the difficulty may arise. The screws which are merely embedded in the wood or vulcanite of the rim, gradually become loosened through continual racking and possible shrinkage of the rim itself. Once permitted to become slack, they work back and forth as the wheel is used until finally they drop out altogether, or else are sheared off when a sudden strain is thrown upon them.

Obviously where the possibility of such a mishap exists it behooves the designer to improve upon the method of construction by devising some means either of locking the screws in place, or by substituting an entirely different method of uniting rim and spider. For the user, it may be suggested as a wise precaution that whenever the rim is found to have even the slightest perceptible amount of lost motion over the spider, the heads of the screws should be bared and the screws themselves tightened or replaced with new and larger ones. The risk involved is far too serious to be lightly overlooked.

Because of the decrease in automobile registrations in almost all of the states during October, it has been suggested that the motor car trade could not have been quite as brisk during the month as many of the dealers represented. The explanation, according to a prominent metropolitan dealer, lies in the fact that most of the orders given during October were for 1909 cars, which will not be delivered for some little time to come.

LOW FARES TO NEW YORK SHOWS

Trunk Line Grants Special Rate to A. A. A. Members—Applys to All Points Except New England and the South.

That members of affiliated clubs and individual members of the American Automobile Association desiring to attend the midwinter automobile shows in New York City will be given the benefit of a special reduced round trip railway rate of a fare and three-fifths over all lines controlled by the Trunk Line Association was announced from the National Headquarters of the A. A. A. this week. This benefit has been secured in order to permit members living at a distance to secure the benefits of the two show weeks in addition to attending the open meetings which the association purposes holding during the two periods of January 4-7, inclusive, and January 19-23.

In accordance with a plan already announced the association is perfecting arrangements for the meetings which are designed to strengthen the position of the A. A. A. and to further the interests for which that body is laboring. The gatherings will be held at the National Headquarters.

The first series will be coincident with the show in Grand Central Palace, held under the auspices of the American Motor Car Manufacturers Association, which opens on December 31st, and continues until January 7th. Tickets and certificates applicable to this period may be purchased not earlier than December 31st nor later than January 5th, for the trip to New York, which certificates when duly validated will entitled the holder, up to and including January 11th, to a continuous return ticket over the route upon which the going journey was made.

The second series of meetings will be held in connection with the show of the Licensed Association of Automobile Manufacturers which opens on January 16th and continues until January 23d. Tickets and certificates of the second series may be obtained not earlier than January 16th nor later than the 21st for the trip to New York. The certificates entitling the holder to a continuous return ticket over the same route on which the going journey was made, may be validated up to and including January 24th.

Only members of the clubs affiliated with the A. A. A. and individual members of the association will be entitled to these reduced fares. Motorists who are not members may obtain individual membership upon application to Frederick H. Elliott, secretary, 437 Fifth avenue, New York City. Membership must be secured prior to making the trip, however, in order to entitle the new member to the reduced fare privileges. By the concurrence of the Central and Western passenger associations the rate is made to cover all points east of Denver, but not including New England or the Southern States. Members traveling over the lines controlled by the Western Association will be granted the rate of a fare and three-fifths east of Chicago, Peoria and St. Louis. West of those points they will be given a special low rate in accordance with the regulations of the Western Association.

COMING EVENTS

November 14, Philadelphia, Pa.—Quaker City Motor Club's race meet, Point Breeze track.

November 25, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Baltimore, Md.—Automobile Club of Maryland's hill climb, Belvidere avenue hill.

November 26, Savannah, Ga.—Automobile Club of America's (New York), 400 miles race.

November 27, Denver, Col.—Colorado Industrial Exposition Association's race meet. Overland Park track.

December 31, Long Island Motor Parkway—Speed trials against time, auspices of the Long Island Motor Parkway, Inc.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

Traffic Experts to Confer.

For the purpose of still further enhancing the importance of its traffic department, the National Association of Automobile Manufacturers, Inc., has arranged for a series of meetings of the traffic experts connected with the various automobile factories. Under the arrangement recently made, the department now represents not only the National Association of Automobile Manufacturers, but the Licensed Association of Automobile Manufacturers and the American Motor Car Manufacturers Association as well, embracing a total of 93 members. Of these a large number take full advantage of the facilities offered by the department, which attends to classification matters, checking of freight bills, the proper classification of goods shipped to and from the factories, the preparation of and all other attention to claims, and kindred matters requiring expert attention.

James S. Marvin, manager of the traffic department, is at present in the West attending a meeting of one of the classification committees and as soon as that meeting is over, will hold meetings with the traffic managers in Cleveland, Indianapolis, Chicago and Detroit. Later on meetings will be held in eastern cities and it is not unlikely that general meetings will be held during the New York and Chicago shows.

LOCOMOBILE DAY AT BRIDGEPORT

City Makes Holiday in Honor of Vanderbilt Cup Victory—Banquet to Builders and Driver of Winning Car.

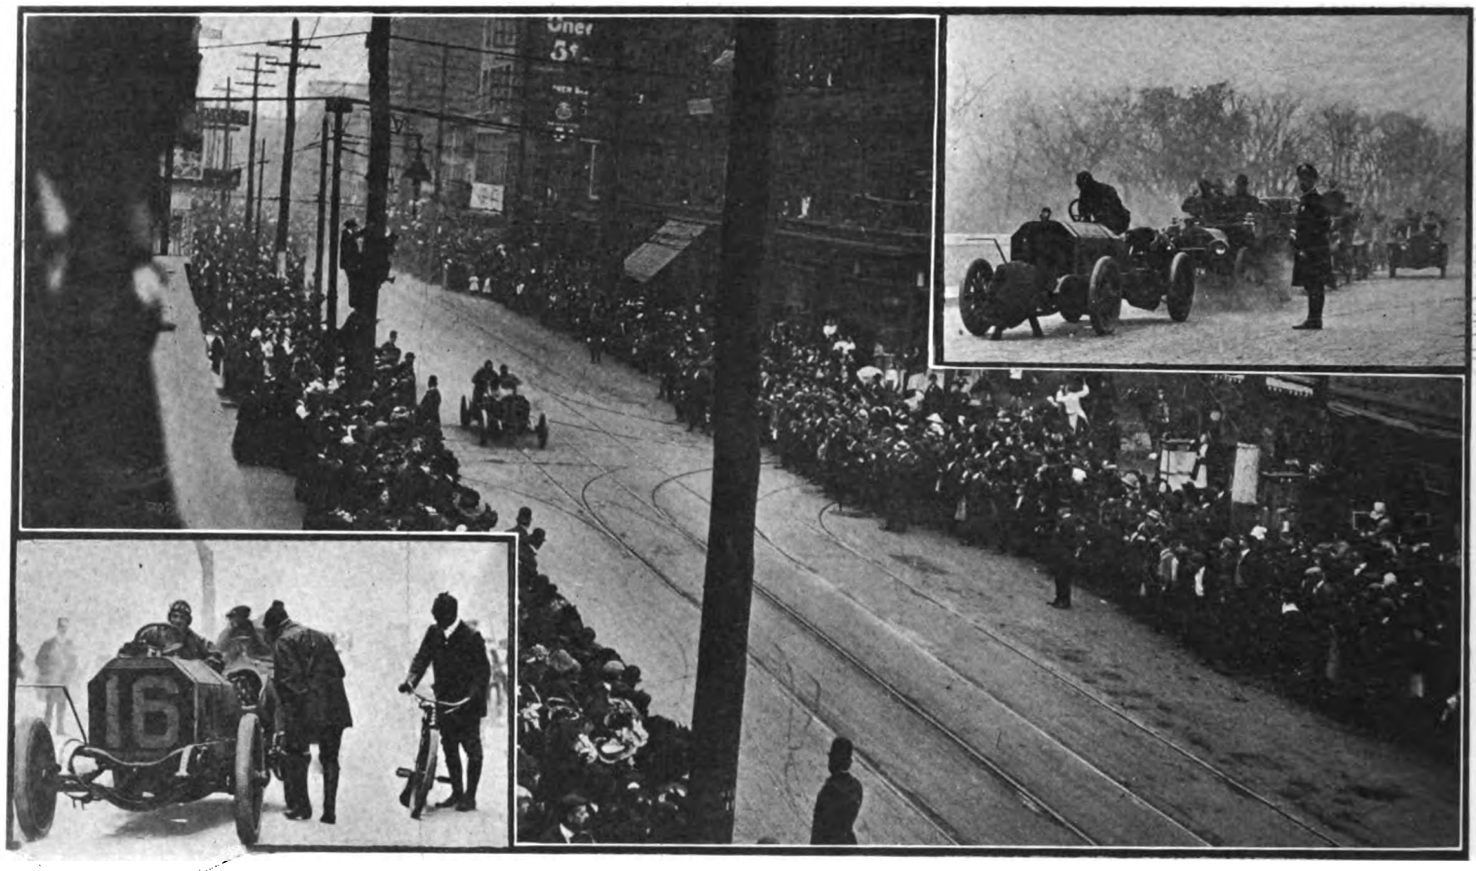
It is probably no exageration to say that seldom if ever has more sincere or enthusiastic tribute been paid to local enterprise than that accorded the Locomobile Company of America by the City of Bridgeport this week, in token of the victory of its car in the Vanderbilt Cup contest of two weeks ago. On Monday, 9th inst., a half holiday was declared in all factories, schools and local places of business, crowds thronged the streets to witness an exhibition performance by the car, and in the evening the celebration was crowned by a banquet tendered by the Bridgeport Board of Trade, the Manufacturers' Association and the Press Club, to the officers of the company and to George Robertson, driver of the winning No. "16" car. As an outburst of civic pride it was quite as conspicuous as in its avowed character of a flattering tribute to a significant achievement in the industry.

As a preliminary to the affair, the victorious car, which had been on exhibition at the New York show rooms of the company, made a triumphal progress to its home town on Sunday. Accompanied by an escort of a score of sister cars carrying representatives of the company and their guests, it made a scheduled run over the famous route across the Connecticut border. Along the way crowds were gathered at places where it had been announced stops would be made to enable the machine to be inspected. At least one stop not on the schedule also was made when, at 116th street, Manhattan, a motorcycle policeman halted Robertson and cautioned him against violating the speed law. As Bridgeport was approached the crowds and the enthusiasm increased until the streets were literally lined with people, many of whom had gone long distances to witness the passage of the car.

Monday's program was characterized by an exhibition of the car on the public streets, when apparently all of Bridgeport's 80,000 inhabitants and a few others from outside were packed along the course. Opportunities for a display of the true speeding capabilities of the car were somewhat limited because of the congestion, nevertheless, in traversing Main street, Bullshead, Meadow street and Washington and Madison avenues some little speed was attained, and in a flight the length of Main street, the distance of 5½ miles was covered in 7 minutes. The demonstration was such as is seldom called forth for any purpose, and probably has never been approached by any similar occasion attributable to the automobile industry.

The banquet of the evening was laid at the Hotel Stratfield, for 300 guests and was graced by the presence of a number of well-known motorists, as well as local celebrities, city officials, newspaper men and others. It was specifically tendered to the officers of the company and crew of the Locomobile which captured the Vanderbilt trophy. The guests of honor included: S. T. Davis, Jr., the president of the company; Amzi L. Barber, his father-in-law; A. L. Riker, designer; E. F. Russell, superintendent; T. H. Thomas, treasurer; J. A. Kingman, George Robertson and Glenn Ethridge, his mechanic. State's Attorney Stiles Judson served as toastmaster, introducing the speakers, and said that the winning of the race was a triumph for the country, for Connecticut, for Bridgeport; a triumph for Riker, the designer of the car, for the officers of the Locomobile company, and the mechanics who put their brains into steel in the making of the car; and for Robertson, the intrepid driver, and his mechanician.

In closing, he pledged this toast: "To the future of Bridgeport, and to the future of Bridgeport's citizenship and may her interests be forever confided to the care of such whole-souled and sterling business men, who through their organizations and aided by the Press Club, have contributed so much success to this occasion."



ROBERTSON, THE VANDERBILT CUP, AND THE WINNING CAR AT BRIDGEPORT

Laudations of the car and its makers constituted the chief theme of the speakers at the banquet, an exception being in the case of Barber, who was introduced as the father of the Locomobile company. After laughingly explaining that he had founded the company merely to furnish an occupation for his son-in-law, he devoted his attention to the subject of good roads. A somewhat important utterance was made by Frank G. Webb, vice-chairman of the Vanderbilt Cup Commission, whose remarks constituted the first public declaration of a plan for altering the rules governing the cup contest and forecasted their probable modification to conform to the regulations promulgated by the international congress of recognized automobile clubs.

In remarking that the Locomobile had won its last race and would be ineligible for future contests for the cup, Webb created something of a stir until he explained that in all probability the rules would be changed

Digitized by Google

HELD UP BY NEW YORK COP—ROBERTSON'S FLIGHT ON MAIN STREET, BRIDGEPORT—HALTED ON CITY ISLAND BRIDGE.

before another race was held, and that that particular Locomobile would therefore be ineligible to compete again. The bore of engines on competing cars will be restricted in future probably to 131 millimeters and perhaps the stroke as well. It will be remembered that a decision in this direction made early last summer, would in all probability have prevented the break between the American Automobile Association and the Automobile Club of America.

Others speakers of the evening were Police Commissioner George Hill, as Mayor Lee's substitute, and John C. Wetmore, representing the press; Fred Enos, president of the Board of Trade, and others.

One of the chief features of the dinner was the Vanderbilt Cup itself, which stood on the table directly in front of the proud Robertson. Its presence also was the occasion of the presentation to the company of a set of resolutions of appreciation suitably engrossed, by Judge E. K. Nicholson for the Bridgeport Board of Trade, while Andrew L. Riker was the recipient of a Board of Trade shield, in token of his skilful services as originator of the car. Later Robertson was presented with a cup emblematic of the spirit of the evening and bearing the significant legend:

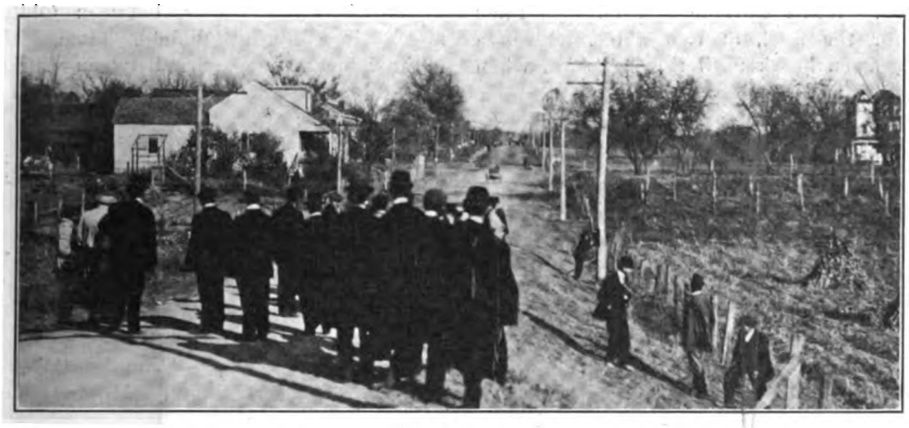
"Local Pride Cup, presented to George H. Robertson, by the Bridgeport Board of Trade, in recognition of his skill and courage in driving the Locomobile 'Made in Bridgeport' to victory and winning the Vanderbilt Cup, October 24, 1908."

Formal presentation of the cup to the winner will be made at the club house of the Automobile Club of America to-night (Thursday), when further tributes will be paid to the achievement. The presentation will be made by Jefferson De Mont Thompson, chairman of the Cup Commission, in addition to which a limited number of speeches will be made by men well known to the sport and industry. There will also be a lighter section of the program, consisting of an exhibition of moving pictures showing the contests for the Vanderbilt trophy and other recent events.

GREETINGS AT NEW ROCHELLE

In many respects the last has proved to have been the greatest of the four Vanderbilt races. Not only was it distinctive to the American because it was a clean victory for an American car, but also because of the fact that the average time of the winner was better than that made by the winners of any previous race. Some little confusion was brought about at the time owing to the fact that the account of the race published by the Motor World failed to emphasize the fact. This was due to an inadvertent comparison of averages for the race. Wagner's average for the 1906 race was 61.43 miles per hour instead of 65.13. As everyone now knows, Robertson's average time of 64.3 was faster than any previous average.

Club Formed to Run Special Trains.



The Twentieth Century Automobile Club, of New York City, has been incorporated under New York laws. with $500 capital. The incorporators include Horace B. Dobbie, Samuel D. Koch and Arthur C. Stafford, 302 Broadway. The club is to run a special train to the races at Savannah.

ST. LOUIS SEES ITS FIRST CLIMB

Baldwin Makes Best Time up Solomon's Hill—Then Oldfield, Christie and Soules Give Two Days Circus.

Motorists of St. Louis, Mo., and vicinity were treated to a dashing exhibition of hippodrome enterprise on Friday, Saturday and Sunday last. 6th-8th insts., when the conquering trio, Oldfield, Christie and Soules, together with a few local contestants and others performed on Solomon's hill, and on the old fair grounds track. Ostensibly—that is to say, according to the Oldfield posters—the meet was under the auspices of the "Auto Dealers' Association," though as a matter of fact this announcement was a source of some surprise to the members of the St. Louis Automobile Manufactures and Dealers Association.

VIEW OF SOLOMON'S HILL FROM STARTING POINT AT FOOT.

When E. A. Moross dropped in on St. Louis a few weeks ago with determination in his eye, the gods smiled on him; for that very night the members of the association were about to meet and talk over their hill climb and show plans. Moross, who is the manager of a theatrical company of thrillers, appeared at the meeting and made a modest little speech in which he said something about a three-day carnival and explained to the association what a fine thing it would be for them to have two days of track doings follow their proposed hill climb. The dealers refused all his blandishments. Moross, of the "Dare Devil Drivers" company, however, did not retire to the woods defeated. He ordered on his scenery props and actors, emblazoned the town with picture work of the beloved Barney and the dates of the two-day meeting at the old fair grounds race track, with some fine print underneath about the climb on Solomon's hill. In larger letters followed, "Under the Auspices of the Auto Dealers Association."

St. Louis had never had a hill-climb before, and lots of people owning nice automobiles did not know how uninteresting such things can be, so fully 500 of them drove out 14 miles on the Manchester road and lined up for the sights. About ten times as many more people got out there, too, although there wasn't any way to do it except a-foot or en automobile.

Keenly expentant, they waited an hour or so while an amateur adjusted the electric timing device. Then a motor buggy came up the one-sixth mile grade in 2 minutes 54 seconds.

Keenly expectant, they waited an hour they would figure out the percentages based upon piston area, and weight of the competing cars, the latter went home and retired without tackling the job. The next day the dealers said that it was "up to the judges." The judges haven't gone to work with the figures yet, and the indications are that they will not. Nevertheless it is pretty clear that Baldwin, driving a specially made Stanley steamer won the laurels in the free-for-all with a time of 40⅘ seconds. The best time for a gasolene car was that of the Apperson, driven by McClain, which covered the grade of six-tenths of a mile in 46⅖ seconds. In the class for cars with piston diameter between 65 and 90 square inches the Apperson, driven by McClain, beat the 30 horsepower Moon by a close margin.

The incline for the test has a bad turn and because Philip Wells, who piloted the made a vain attempt to regain the record but could not touch the steamer's mark. Once upon a time Oldfield made the old record of 0:59 for this particular course. 30 horsepower Moon, tried to take it at a 35-mile an hour clip, he came to grief. For a minute after the spectators at the top of the hill thought that car and driver had been terribly injured, but when the cloud of dust cleared Philip Wells was found sitting at the wheel of the car with a broad smile on his face. On account of three crazy turns that the machine made a rear wheel gave way, but otherwise the car was uninjured. The Moon was the first fast car to take the turn. Other drivers that followed profited by the accident and cut out their motors when they approached the dangerous spot.

The incline known as Solomon's Hill is the stiffest gradient within a radius of 100 miles of St. Louis. There are steeper turns in the Ozark foothills only. At first the grade is easy, but it grows steeper as the road leads on. The danger curve in the shape of an "S," is about the middle of the route; then the grade becomes stiffer and stiffer to the summit.

The 45 horsepower Stoddard-Dayton, driven by Tuttle, scored over the Packard and Stevens-Duryea stock cars. Tuttle negotiated the climb in 49 flat. The Packard's time was 54⅘ seconds. Oldfield and Soules both covered the distance in 46⅖ seconds.

The feature of the first day's program for the track meet was L. H. N. Baldwin's mile, which he covered in the Stanley steamer in the fastest time ever made by an automobile—on that track. The redoubtable Barney Oldfield made a vain attempt to regain the record, but could not touch the steamer's mark. Walter Christie also tried a circuit in his big "Record Breaker," but the best he could do was 0:59 flat, or two-fifths of a second better than the time made by Oldfield.

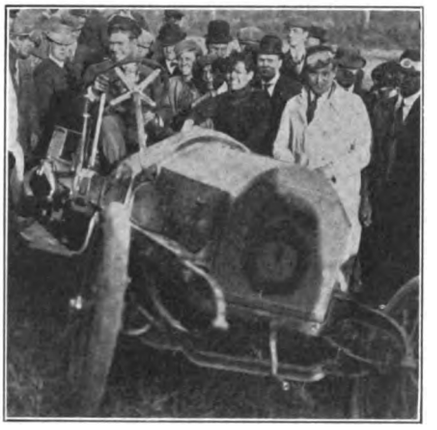
BAD TURN LOCALLY KNOWN AS "THE HAIRPIN"

Ollie Savin also performed and made a trial at the mile rocord, but failed to outdo the other exhibitors. Savin, it must be re-

Digitized by Google

membered, is none other than "The Great Savini, Champion Driver of Italy," of a year or two ago, and later said to be a chauffeur whom Oldfield had discovered in somebody's garage.

When a "sweepstakes" event was called, Oldfield had no trouble in taking the first heat of 2 miles from Savin in 2:21⅕. Later Christie beat Soules in the second heat in 2:08. This entitled him to try at the final of one mile with the intrepid Barney. The ensuing bout was described locally as the "greatest race ever seen in that part of the country." Christie drew the ragged edge and on the first jump, Oldfield slid along the pole and held it. But Christie was rubbing against his rear tire in hot pursuit, as they flew round, throwing up a surf of dust. In the last 50 yards of the stretch, Christie shot ahead and won by a carburetter's length in 1:04⅕.



The three miles handicap between Paul Caldwell in a 6 cylinder Pierce (25 seconds), Baldwin in a Stanley steamer (scratch), Jack Blincoe in a 30 horsepower Packard (25 seconds), Jack Taylor at the wheel of a Stoddard-Dayton (20 seconds), and Soules in the Stearns "Red Devil" (15 seconds), was run under a blinding dust cloud. As a result, the Pierce driver deftly won in 3:31, the others failing to catch him. Baldwin, however, passed all of the other contestants, except Caldwell, scoring second, with Taylor in third place.

Two "special" races followed, for Ford and Moon cars, respectively. Sluder and Britter scored first and second in the first of the two, the time being 3:27 for the two miles, while Philip Wells got away with the 2 miles Moonbeam spin in 2:31⅘, with Grinham second.

There was plenty of low comedy in a rough-house 5 miles "novelty" affair, that would be considered a little too strenuous by most law abiding citizens. The conditions provided that each operator should drive his car alone the first mile and at the end of this, pick up three passengers, discharging them at the close of the second mile; then in the third lap, pick them all up again and dump them after the fourth circuit and finish the last lap alone. None of the drivers bothered to slow down sufficiently to permit graceful unloading and as a result, passengers had to take flying leaps from the flying cars, landing all sorts of ways in the dirt. Some of the drivers lost their heads in their high speed efforts, the Moon pilot forgetting to take on a load of passengers on one round, and the Chalmers-Detroit getting away with only one instead of three passengers. F. Maynard, in a Maynard car, was the winner in 8:37⅗.

Two accidents marred the day: one to F. Bahnson, riding a motorcycle in a preliminary event, when he skidded and was thrown, and the other when William Igoe, driving a Moon, plunged through the fence at the far turn in a special trial. Dust blinded the latter driver, who pulled through very slightly damaged, although the car was smashed.

Sunday, the second day of the trackfest, saw Oldfield turn around and beat Christie in the final of another sweepstakes. In the first heat Christie disposed of Soules with ease, when he circled the mile course in 1:00⅗, leaving his opponent to admire the scenery. Then Oldfield and Savin went at it in the second heat, and, of course, the former won, making the two miles in 2:03¾. When Christie and Oldfield lined up for the final, at two miles, it was a fairly even break until the last turn, when

WELLS SURVIVES WRECK OF THE MOON

the latter out-generaled Christie and won by two lengths in 2:04 flat.

It was Baldwin in his steamer, however, who got the crowd enthused. The car went whistling around in a mile trial, and equalled its mark of the previous day, 0:54⅘. Oldfield and Christie performed second best in the mile trials, each doing a circuit in 0:58. Soules went around in 1:02, while Caldwell in his Pierce six did a lap in 1:04⅗.

The five miles handicap saw practically the same starters as the 3 miles handicap of the first day. Baldwin starting from scratch, won a really creditable victory, for in passing the others he had to tear through a veritable maelstrom of flying dirt and pebbles and blinding dust. One by one, he cut down Soules, Caldwell, Phil Wells, Jack Taylor, and demonstrated that in short bursts of speed, stock cars are not to be classed with the special steamer product. Baldwin's time was 3:34, or 3:04 net, and Taylor and Wells scored second and third, respectively.

Jack Taylor, Stoddard-Dayton, took a 2 miles special from Wells, Moon, without great effort in 2:21⅗; H. M. Paine, in a Chalmers-Detroit, being the also-drove. Caldwell piloting his Pierce spread himself by winning the event for comedians—the five miles novelty race. The summaries:

Saturday, November 7.

Two miles for Ford runabouts—Won by H. K. Sluder; second, P. Britter. Time, 3:27.

Two miles for Moon cars—Won by Philip Wells; second, Grinham. Time, 2:31⅘.

Two miles, open to Buick and Chalmers-Detroit cars—Won by McQuillan, Buick; second, Paine, Chalmers. Time, 3:01⅕.

Four miles novelty—Won by F. S. Maynard, Maynard. Time, 8:37⅗.

Sweepstakes event; first heat, 2 miles, between Christie and Soules. Won by Christie. Time, 2.08.

Second heat, 2 miles, between Oldfield and Savin—Won by Oldfield. Time, 2:21⅗.

Final heat, one mile, between Christie and Oldfield—Won by Christie. Time, 1:04⅕.

Five miles motorcycles—Won by J. H. Anderson; second, Frank Hazzard; third, Charles Cornwell. Time, 6:53⅗.

Sunday, November 8.

Two miles special—Won by Jack Taylor, Stoddard-Dayton; second, Philip Wells, Moon; third, H. M. Paine, Chalmers-Detroit. Time, 2:21⅗.

Five milesfi, novelty—Won by Caldwell, Pierce; second, Quinlan, Moon. Time, 7:42.

Exhibition mile—Won by Baldwin. Time, 0:54⅘; second, Oldfield, 0:58; third, Soules, 1:02; fourth, Caldwell, 1:04⅗.

Five miles handicap—Won by Baldwin (scratch); second, Jack Taylor (30 seconds); third, Philip Wells, Moon (30 seconds. Time, 3:04. Caldwell, Pierce and Soules, Stearns also competed.

Sweepstakes event—First heat, 1 mile, between Christie and Soules—Won by Christie. Time, 1:00⅗.

Second heat, 2 miles, between Oldfield and Savin—Won by Oldfield. Time, 2:03¾.

Final heat, 2 miles—Won by Oldfield. Time, 2:04.

Speed Indications for Savannah.

Results of the first practice spins over the Savannah course for the forthcoming Grand Prix race have enabled the prophets already gathered about the southern circuit to form the first estimates as to the times possible of achievement in the race. Although the course is smoothly laid at all points and the turns well banked, it is thought that the number of curves to be encountered will seriously affect the running of the cars. According to one estimate, however, the average may run as high as 68 miles an hour. There are 16 turns in the circuit so that the drivers will have to negotiate no less than 256 corners in the 400 miles race.

America's chances of winning were increased this week by the entry of a sixth competitor for the Grand Prix contest in the 50 horsepower Buick which Robert Burman is to drive. The American representation in full will comprise, in addition to the Buick, the Simplex, National, Lozier, Acme and Chadwick cars.

NEW ORLEANS EASY FOR STRANG

His Only Failures Caused by Grandstand Play and Tire Trouble—Honey Wins the Fifty Miles Event.

New Orleans' two days track meet held on Saturday and Sunday, November 7-8, at which Lewis Strang and Emil Stricker were billed as head-liners, turned out to be rather uneventful. At times it was very tame, while occasionally bursts of speed worked the enthusiasm of the crowd to a high pitch. Stricker made no sort of a showing, owing to motor troubles and as a result, Strang had no one of high calibre to give him any amount of argument. He took first place in a few races, in walkover style. Tire trouble, however, caused him to lose the big event of the meet, the 50 miles, and an unusual self-imposed handicap prevented him from scoring first in another race which might easily have been his. It is to be hoped that the next race meet held by the newly organized New Orleans Automobile Club will provide slightly better racing, although as a first attempt, this one was considered a success by the local enthusiasts.

On Saturday, the first day of the meet, Lewis Strang distinguished himself from the very start. He made his first appearance in a five miles three-cornered race, which was run in heats and pleased the expectant crowds by winning two out of the three. The first heat was between Herbert Conners in a car bearing the awe-inspiring soubriquet, "Red Devil," and Jack Racklyf, in a Thomas Flyer. The fire and brimstone in the Satanic car soon began to smoulder and in the fourth lap it withdrew, with all of its devilishness completely subdued. Racklyf's time was 6:45. In the second heat, Strang in his Renault, Emil Stricker in his "Green Dragon," and Charles Swaboda gripping the wheel of a Stoddard-Dayton figured. The Green Dragon had trouble with its radiator, and Strang worried no longer, but beat Swaboda by a small margin. Strang led easily through the fourth mile of the final, with Swaboda second and Racklyf third, and then when Swaboda's car broke down, Strang stopped and permitted his mechanician to assist the stalled car. In the meantime, Racklyf, in the Thomas, gained materially on Strang, but the winner of Savannah and Briarcliff soon recovered his lead. winning a victory none too brilliant in 6:29.

In a curtain raiser for cars selling at $1,500, at 5 miles, Thurber, piloting a Chalmers-Detroit, won the honors in 6:50⅕, the race being gingered up by A. L. Abbott's Buick smashing down a fence. Driver and mechanician were hurled out, but escaped injury. Only two contestants faced the starter in the five miles open—"Andy" Anderson with a Ford "Six," and M. F. McIntyre in a White steamer, the latter being protested at first on the ground that it was "specially built." Later when Anderson beat the White in a walkover, to the tune of 6:38⅕, the protest was withdrawn.

In the final event the piece de resistance of the first afternoon, Strang attempted a bit of grandstand play and sacrificed the event in consequence. The race was scheduled to run 50 miles, but on account of the lateness of the hour it was cut to 20. So sure was Strang of winning that he announced that he would stop in front of the grandstand at the end of the tenth mile and change a tire, giving a demonstration of how quickly it could be done. When the field started, Strang got the jump on the others—Racklyf in the Thomas, Anderson in a Ford Six, and McIntyre in a White steamer—and the Renault led for the first 10 miles. Then Strang stopped his car and took just three minutes to remove an old tire and substitute a new one. Meanwhile the Thomas Flyer had gained a mile and a quarter. The Renault driver then set out in an effort to regain the lead. One mile was caught in 58 seconds, which was the fastest of the day. But it was getting dark, and in consequence of this, perhaps, Racklyf finished first, doing the 20 miles in 25:13, and Strang crossed the line just a second after him. Strang's time for the 20 miles, with the three minutes taken out, during which the tire was changed, was 22 minutes and 16 seconds.

In the "feature" event of the second day, the postponed 50 miles race, Strang was a loser. He was leading Frank B. Honey, who was at the wheel of a 60 horsepower Thomas and the pair were making a good race of it when one of the Renault's tires punctured. Strang drove a lap on the rim and then lost three minutes making a change. Honey seized the advantage and made the most of it. the star of the meet failing to catch him before the tape was crossed. The winner's time was 1:01:40, Strang rolling in a natural second, inasmuch as the two other contestants had dropped out. One of these. Charles Swaboda, in a Stoddard-Dayton, broke an axle, which caused him to go crashing through a rail fence. Anderson in the sulphurous "Red Devil," was obliged to quit in the early stages of the bout.

Strang was quite disturbed over his defeat and challenged Honey to another contest at the same distance, agreeing to forfeit $500 to some charitable institution if the Renault could be beaten. The Thomas driver did not pick up the gauntlet, however.

Swaboda in the Stoddard took first in a five miles stock car event, in 6:37⅕, trailed by Anderson in a Ford "Six," and A. L. Abbott with a Buick. The Pelican Handicap at 5 miles, was easily won by Strang. He covered the distance in 5:42⅕, making one of his miles in 0:58⅕. Anderson played to second place, while the Ford and Fred Haack followed.

The wind-up was rather fizzlish. All of the "stars" were scheduled to start in the final five miles event, but at the last moment, the Honey Thomas was withdrawn, and as Swaboda's car was wrapped around a fence post, it was hopelessly barred. This left the fight to Strang and Stricker, and the latter playing in hard luck, broke down after leading Strang for a mile. Strang's time for the lone race was 5:53⅕.

The summaries:

Saturday, November 7.

Five miles, cars selling at $1,500 and under—Won by E. J. Thurber, Chalmers-Detroit (walkover). Time, 6:50⅕.

Five miles, cars selling at $3,000 and under—Won by Anderson, Ford; second, M. F. McIntyre, White. Time, 6:38⅕.

Five miles, Crescent City Sweepstakes—First heat won by Jack Racklyf, Thomas; second heat won by Lewis Strang, Renault. Time, 6:05. Final heat and race won by Strang. Time, 6:29

Twenty miles, open—Won by Jack Racklyf, Thomas; second, Lewis Strang. Time. 25:15.

Five miles motorcycles—Won by Arthur Redfern (N. S. U.); second, Russ Smith (N. S. U.).

Sunday, November 8.

Five miles, cars selling at $3,000 and under—Won by Swaboda, Stoddard-Dayton; second, A. Anderson, Ford; third, Abbott, Buick. Time, 6:37⅕.

Fifty miles open—Won by Frank B. Honey, Thomas; second, Strang, Renault. Time, 1:01:40.

Five miles, Pelican Handicap—Won by Lewis Strang; second, A. Anderson, Ford; third, Fred Haack, Pope-Toledo. Time, 6:37⅕.

Five miles motorcycle—Won by Russell Smith (N. S. U.). Time, 7:10⅕.

Swanbrough Wins Denver Economy Run.

Eighteen cars started out bright and early on Saturday last, 7th inst., on the Denver Motor Club's economy test and all survived the ordeal without swooning or stranding in ditches. The run from Denver to Greeley and return covered a distance of 112 miles, and E. W. Swanbrough, driving a Corbin car, won both of the prizes offered—the Ralph W. Smith cup and the Denver Motor Club cup. The first of these was awarded for scoring the highest percentage in accordance with a formula derived by dividing the weight of the car with passengers, by the weight of the gasolene consumed, as expressed in half ounces. The second prize was awarded to the car making the drive with the least gasolene consumption regardless of any figuring on weight or percentage.

Red Bluff Automobilists Organize.

Red Bluff, Cal., has a new automobile club. James Seeley has been elected president and F. W. Becker secretary.

LONG GRIND OF ROUGH RIDING

Page Wins Strenuous "Twice-Around-the-Clock" Race at Los Angeles—Rugged Track Causes Accidents.

Driving 21 hours out of 24, J. Murray Page, at the wheel of a 40 horsepower Locomobile roadster, won the "twice-around-the-clock" contest at Ascot Park, Los Angeles, Cal., on Saturday and Sunday, October 31-November 1, covering 916 miles. His nearest competitor, a Franklin, piloted alternately by Guy Irwin and Ralph Hamlin, rolled up 835 miles, and Harry Lord, handling a Studebaker, almost continuously, was third with 629 miles to his credit. The only other survivor of the seven original starters was a 10 horsepower Reo with Lee Garricke at the stem, who reeled off 474 miles, running practically all of the time.

Page, scoring the second big victory for the Locomobile within nine days, won the handsome Diamond trophy valued at $1,000, while Irwin and Hamlin, the Franklin drivers, and Harry Lord, the Studebaker pilot, were awarded gold medals.

The battleground of this affray—the old Ascot Park race track—was no path of roses or Long Island Motor Parkway, by any means, nor was it even a good mile of ordinary road. The circuit was a trail of furrows, ditches and bumps that made anything but pleasant work for the drivers and the rough course was wholly responsible for the accidents that occurred, though fortunately none of them resulted seriously.

Seven cars faced the starter at 4 p. m., on Saturday, Guy Irwin in a 6-cylinder Franklin; J. M. Page, in the Locomobile; Bert Dingley, intent upon holding up his reputation in the Chalmers-Detroit "Bluebird"; Lee Garricke jammed in the 10 horsepower Reo "Kiddo"; together with Frank Free's Sunset, Harry Lord's Studebaker, and Harold Stone's mixed mount, which is said to be partly Pope-Hartford and partly other brands, and known as the "Paris Pet." It was a fairly even start, all cars except the Franklin making a good getaway. Free was the one to nip the pole first, with Dingley and Page hot upon his rear tires, and for a mile they spun around in this order, Free flashing past the grandstand just a few feet ahead of the Bluebird. For a few minutes the pack found the Sunset about as hard to chase as a rainbow. Then Dingley inched up and by degrees eclipsed the leader, to the tremendous shouting of the 4,000 spectators, when he covered a mile in 1:09, the fastest lap of the entire race. Murray held his own in third notch, threatening Free constantly, while Dingley continued to take the curves at high speed of the sensational order. In the seventh round the latter lapped Lord in the Studebaker and during the eleventh he circled Irwin's Franklin "Greyhound." Before the fifteenth mile was completed Dingley's Bluebird had lapped every car on the course.

When he tried to drive a second ring around Irwin's Greyhound another race was on and the crowd went wild with delight as these two fought, taking turns at passing each other for miles.

Before long, Free, tiring of the hot pace, shut down slightly and was content to drop back to fourth place. Dingley had covered 29 miles during the first 30 minutes of the race.

The end of the first hour saw Dingley leading, followed by Page, Irwin, Free, Harry Lord, Stone with his Pope, which had experienced trouble, and the little Reo, which Garricke was joyously piloting. About this time, all of the contestants were obliged to stop and light their lamps, each being allotted the same amount of time for the purpose.

The cars had scarcely gotten well started with their head-lamps burning when Dingley's Chalmers came to grief and slowed down with a badly burned out main bearing, caused by clogged lubrication. This delayed the car for more than three hours while the motor was being torn down and gave the lead to Page and Irwin. The next thing to go wrong was at the end of the third hour, when the "Paris Pet," on its 147th mile, smashed its transmission with a loud rip and a crash, putting it out of the running for good. The break was such a bad one that part of its gear case dropped on the track, before Stone could stop.

At 11 p. m. the end of the first seven hours period, the contestants were called off the track for two hours, to give the course a good rolling. The contestants shot away again at 1 a. m., the Locomobile fighting hard in an effort to pass the Franklin that Hamlin and Irwin were driving alternately, while Free's Sunset was a close third.

Throughout the night and early morning hours Page kept fighting the Greyhound drivers and looked a likely winner when the sun arose on Sunday. Little by little he gained on Hamlin in the Franklin, and during the 15th hour passed that driver and secured the lead, which the Franklin never succeeded in overcoming. At this stage of the game Page's Locomobile had 613 miles to its credit; Hamlin's Franklin, 602; Free's Sunset, 451; Lord's Studebaker, which had developed engine trouble, 446, and the little Reo, 299—still running consistently.

In the 16th hour, Page increased his lead to 16 miles and in the 19th, he had run his mileage up to 781, leading the Franklin by no less than 21 miles—a margin that seemed safe enough. The Studebaker and Reo were trailing at a respectful distance.

Shortly after 1 p. m. Sunday, George Hart, who was Free's alternate in the Sunset, provided a thrill while ploughing over the soft course at a 50 miles an hour clip. Just as he rounded the three-quarter post, a steering knuckle broke and set the car spread-eagling. It described a snakey "S" in the center of the track; then faced about and came to a calm stop. The break was hurriedly brazed and the car rushed back into the race.

Page was relieved by R. J. Leavitt, the owner of the Locomobile, for about three hours during the third period of the contest—the contestants having been given another recess between 2 and 4 p. m. When Page returned to the wheel his victory seemed certain, for while he was chasing the Franklin at a dizzy pace, the former broke a spring and a piece of the leaf was run over by the Locomobile, cauisng the latter's rear to blow out with a loud report. The Franklin had to retire for two hours; then it reappeared and continued to limp along, game to the end.

Then the Sunset, running third, had a second accident; this time with Free at the wheel. He was letting the car out almost to its capacity, when the other knuckle snapped, sending the car directly into a rail post, upon which a boy was perched, The impact shot the youth through the air at meteor speed, landing him undamaged, however. Free and his mechanician, Kendall, were also thrown, but were not injured. The car, however, was reduced to scrap iron.

When the 22d hour was reeled off Page was leading by 74 miles, with the Franklin credited with 799 miles total, and the Studebaker with 591. Garricke's Reo was the only other car left in the race. Through the 23d hour, the Locomobile ploughed along steadily tearing up the loose dirt and when the long grind was called off its score stood at 916 miles, against the Franklin figure, 835, and the Studebaker 629 miles. Garricke and Oberlin, in the Reo "Kiddo," showed that the midget car could run twice around the clock and stand up on all four tires by chalking up 474 miles to its credit.

Date for Quaker City Endurance Run.

What will probably be the first automobile contest of the year 1909 will start in the cool drab dawn shortly after the New Year horns have ceased tooting on January first next, at Philadelphia, Pa. There may be other contests on this same day in other parts of the country, but the members of the Quaker City Motor Club are going to arise early and make an effort to be "first off" with their third annual endurance run, which is to occupy two days, and which will doubtless attract much interest in the scrapple belt. As there has been a change in the deed of gift of the McDonald & Campbell Cup, which formerly was a perpetual trophy, contested for annually, the next contestant will be a decisive one, as the trophy, under the new conditions, will become the permanent property of the winner. In the search for a clean score eliminating route, the contest committee has decided upon Walkes-Barre and return as the line of battle.

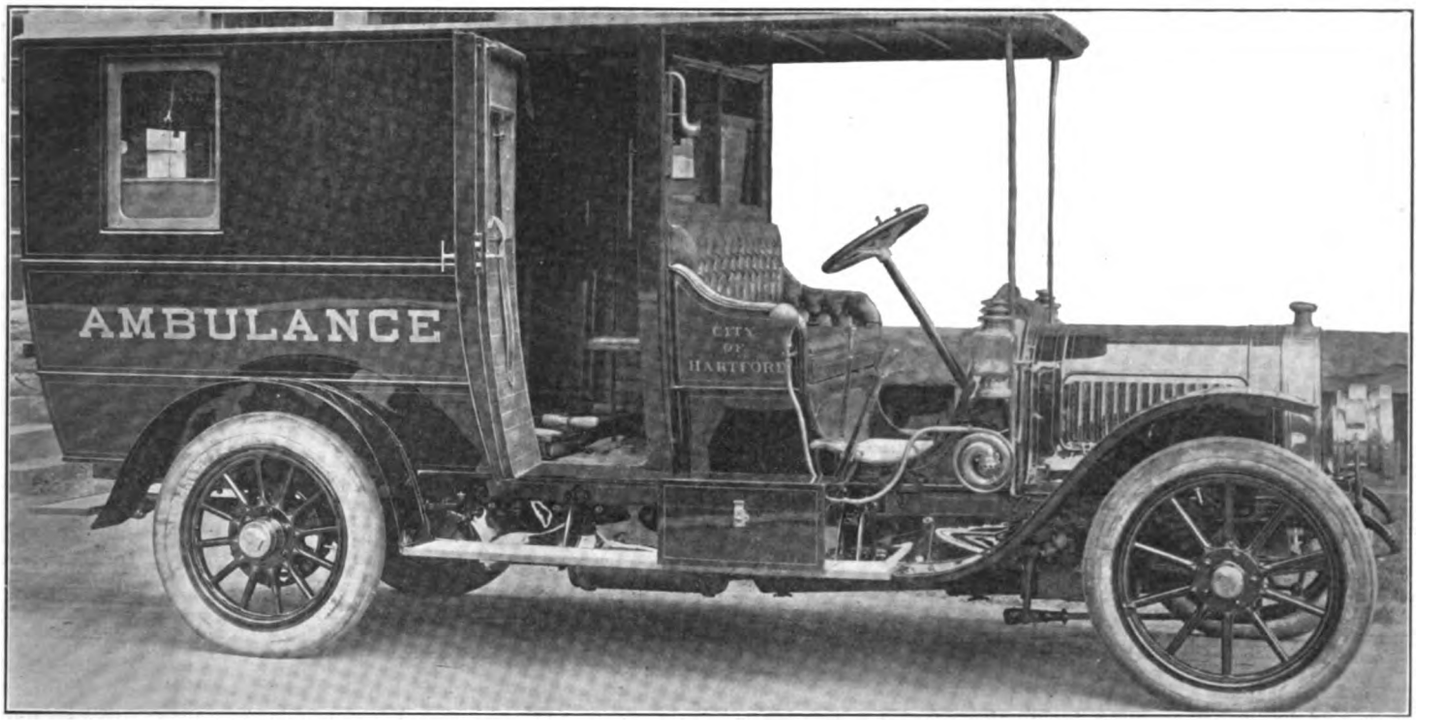
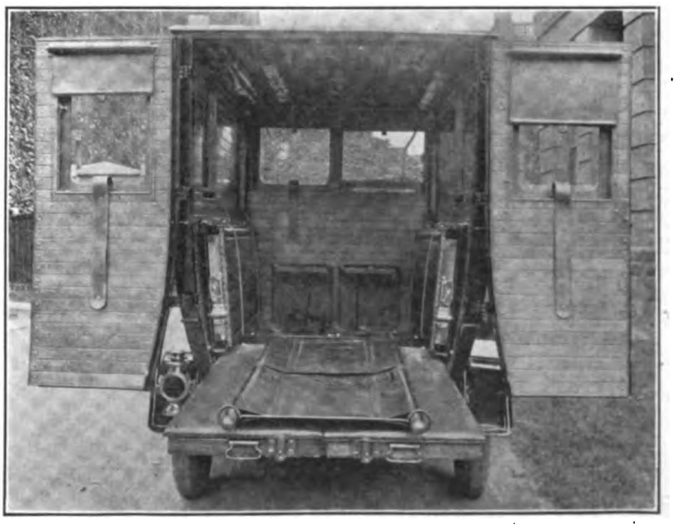
HARTFORD'S MOTOR AMBULANCE



New Pope Model Marked by Departures —Its Unusually Commodious, Accessible and Convenient Interior.

Considerable attention has been attracted locally by the new motor ambulance which was supplied to the City of Hartford, Conn., by the Pope Manufacturing Co., not long since, and which went into active service during the recent Bridge Celebration, on which occasion it gained distinction by accomplishing the successful transportation of no less than eight patients, six of whom were listed as accident cases. In a number of respects, both in regard to the size of the body and its appointment, the machine is a departure from previous practice in the design of motor ambulance, so that its construction is worthy of more than passing attention.



As will be seen from the accompanying illustrations, the body is extremely long, and is furnished with a side door on either side, just back of the driver's seat, in addition to the regular rear entrance for patients. The wheel base is very long, being no less than 130 inches, and the suspension is especially designed with a view to the unusually arduous work for which it is intended. The body is electrically lighted, is furnished with abundant window glass for daylight illumination, has the usual automobile lamp equipment for night work, and carries such tool and emergency equipment as may be required by the 30 horsepower motor.

The interior of the body is 60 inches high, by 36 by 80 inches in floor plan. As will be seen from the two rear views, it is equipped with four beds, leather-covered and arranged to slide in and out on suitable tracks, while by means of a locking arrangement, the beds may be secured when slid into place in the car. Four stretchers also are provided, suspension racks for which are carried on the roof.

The interior furnishings include among other things a medicine chest 31 inches long, fitted with compartments for the safekeeping of the physician's stock, while extra appliances are conveniently located within the interior. There is sufficient room

NEW POPE AMBULANCE IN COMMISSION AT HARTFORD, CONN., WITH VIEWS SHOWING INTERIOR ARRANGEMENT

Digitized by Google

for a physician and nurse to ride comfortably within the body, even when carrying the full quota of four patients, while in cases of extreme urgency this number may be increased without uncomfortable crowding. The convenience, controlability and celerity of the motor vehicle for such a purpose readily commends it for this class of work, while the equipment employed in this case and the method of mounting it proves particularly advantageous.

Flower Holders in Car Equipment.

To please the women who are so fond of flowers that they like to have them even when they are in automobiles, the latest fittings for touring cars and limousines are flower holders. They are graceful little crystal cornucopias with a circle of silver at the top and bottom from which the two attaching brackets project. Their form is such that they may be partially filled with water without danger of the latter slopping out on rough roads, and their taper at the bottom makes it possible to force the flower stems in firmly so that the flowers themselves will not jar out even with the most violent movements of the car. The larger sizes are big enough to accommodate bouquets of considerable proportions, such as roses, chrysanthemums, or wild blossoms that may be gathered by the road side, while the smallest sizes are intended for violets or lillies of the valley. The fancy of automobile flower holders had its origin in Europe, and has grown rapidly during the past summer.

Grotesque Design in a Foreign Horn.

Sharp competition for a lion's share of the horn business has led one foreign maker to the extreme of novelty in a design which has just been developed. The usual flare front is replaced by a fearful and "natural" representation of a dragon's head with protruding fangs, while the ordinary convolutions are replaced by a length of plain flexible tubing of tapering section which extends up to the bulb. The reed instead of being located at the throat just back of the bell, is at the base of the tapering flexible section, the latter thus furnishing the necessary resonance.

Butter as a Solvent for Tar Stains.

Butter, of the common or table variety, is alleged by a foreign expert to be the best possible solvent for removing tar stains from the delicate surface of coachwork. Such stains frequently result from driving a newly finished machine over a piece of road which has recently been treated with dust laying compounds, and more often than not, proves very hard to eradicate. For cleansing the upholstery of the car or the clothing of the passengers, the same authority recommends a knot of clean waste dipped in gasolene or benzine and applied by brushing with it the parts to be cleansed.

CRITICIZES THE GASOLENE MOTOR

Professor Kenerson Points Out Its Limitations—Possibility of Eliminating Its Inherent Weaknesses.

Not being at all satisfied with the present types of gasolene motors, Professor William H. Kenerson, head of the Brown University engineering department, made a wholesale criticism of some of their alleged defects, in an address to the members of the Rhode Island Motor League. While admitting that the present gasolene engine is superior to the steam reciprocating engine in comparative efficiency, he finds fault with many features of its construction and operation, among them being the fact that temperature limitations restrict the efficiency, that the impulses should be replaced with a more even flow of power, and that the transmission system in use cause a great loss of energy.

"The idea of the explosion engine was formed 50 years ago," he said, "and 30 years ago the engine took a form similar to the present style. At that time an engine of 2 horsepower weighed 1,400 pounds, or 700 pounds per horsepower. To-day engines of the same general type weigh, I mean those designed to be light, five pounds per horsepower. Notice the great improvement.

"The first traction experiment with an oil engine was made in Providence, on the Cranston horse car line, about 20 years ago. A 2 horsepower engine was tested out, and it was demonstrated then that it took 30 or 40 so-called horsepower to do the work of two horses. The trial was not satisfactory, because the engine was too weak and too heavy.

"Now an ordinary gas engine transforms about 20 to 25 per cent. of the energy into power at the fly wheel. A steam engine transforms 8 to 10 per cent. as an average. The thing which limits us in the transformation of energy into power in an engine is the temperature incident with the transformation. The metal parts of an engine will not stand heat enough to allow of a greater percentage of transformation. And yet we have the very highest grade metals.

"Another limitation is the degree of compression which we can obtain on the gasses. When you compress the mixture in the cylinder, you increase the heat a great deal. The more compression, the higher the temperature. If you compress too hard, you will get pre-ignition, and then you have to stop at once. I have personally seen an automobile engine run with the spark cut off, through pre-ignition.

"Now the reliability and smoothness of running are among the principal features of an engine. Reliability depends upon the proper mixture and its proper use. Smoothness depends upon the evenness of the impulses from the explosion. It is an inherent fault of the present type of gasolene engine, this very powerful impulse given to the piston at more or less regular intervals. Increasing the number of cylinders in an engine is a way to remedy this defect, but not a satisfactory way, for it is merely adding more trouble to a bad thing. The steam turbine and the electric motor, where the impulses are practically continuous and evenly distributed, are samples of the highest type engine for smoothness. A double action gasolene engine, or one where an impulse is given to each end of the piston is altogether too hard to keep cool in a small engine suitable for automobiles. And we must keep the cylinders cool.

"Transmission also is a defect in the present engine. A great deal of power is lost there. I have recently tested at Brown an engine rated 60 horsepower, and found but 35 horsepower delivered at the wheels. Now the metals we use, and the exactness of construction, are nearly perfect, so we can look for no great improvement in the engine from that direction. The designing is perfect, and the assembling.

"We must develop an entirely new type of gasolene engine in order to improve on the present one, and you will agree that there can be improvement in many directions. I believe there is an entirely different kind of gasolene engine which will be developed, still using the idea of internal combustion, or explosion. It will be found possible to remove nearly all the inherent weaknesses of the engines. . . . . And first of all, we must get an engine which will have a more even turning point, and will not deliver such a shock to the piston, with such a tremendous decline in pressure following immediately thereafter."

Concrete Construction for Garages.

Concrete construction for garages has two great advantages, according to an authority in this line. Reinforced concrete, he says, makes it possible to have the floors with few or no supporting columns, thus affording the maximum of free space for moving the cars about. In addition to its fireproof qualities, the concrete flooring is impervious to oils, gasolene or water, so that machines may be washed or stored on the upper floors without any drippings to the floors below.

Cheap Fuel for Pacific Coast Motorists.

As California distillate costs only 6 cents a gallon as against the usual Pacific Coast price of 25 cents a gallon for gasolene, there is much joy among prospective users of White steamers on the Coast over the fact that the 1909 models shipped to that locality will be equipped with burners capable of using the cheaper fuel. It is claimed for the distillate that in addition to its advantage in price, its thermal efficiency is greater than that of gasolene.

NEW IDEA IN THE DIFFERENTIAL

Application of Leverage System Dispenses with Gearing—The Principle Employed in Various Adaptations.

Many different forms of differential or compensating mechanism have been designed at one time or another, but with few exceptions designers have resorted to the use of toothed gearing for the purpose, practically the only known exceptions to the rule hitherto having been in the case of differential clutch systems. On this account no small interest attaches to a device which has been given some little notice in England recently, in which the usual balancing action is secured as with the ordinary forms of differential, but without the use of gearing of any sort, a simple system of leverage taking the place

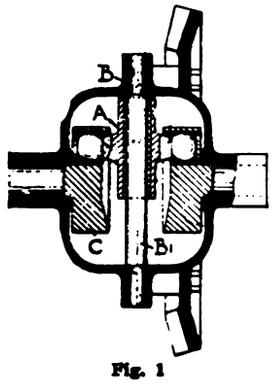

Fig. 1

which toothed gearing ordinarily fulfills in arrangements of the more conventional order.

The result is an unusually compact and simple device, comparing favorably in the matter of construction with the differential clutch and capable of a rather wide variety of application. In place of the usual jack shaft with its pair of bevel pinions meshing with corresponding pinions on the stub shafts, or the several pairs of small spur pinions meshing with larger gears on the ends of the shafts, as is commonly necessary with differential gears, the casing of the device carries a short shaft with its axis at right angles to the axis of the main shaft or axle, while upon it is mounted slideably a small lever which in some manner engages the faces of two discs which form the termination of the stub shafts. Variations in the arrangement are brought about by altering the method of connection between this intermediate member and the shaft ends. The principle is the same in any case.

The principle of action, though somewhat obscure at first, develops upon study. In its simplest form the arangement would comprise merely a short bar loosely mounted on the transverse shaft with its rounded ends engaging cylindrical depressions in the faces of the two discs keyed to the ends of the differential shafts. Power applied to the carrier or housing member, would of course cause both shafts to be driven uniformly so long as they presented equal resistances. As soon as differentiation commences, however, relative motion in opposite direction would be induced in the two shafts, which would be accommodated by the movement of the central and connecting lever or beam.

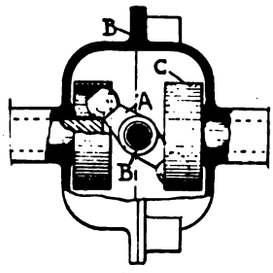

Fig. 2

In order to accomplish this, the beam would be given a combined movement of oscillation about its axis—the transverse shaft—and one of lateral movement along it. The intermediate member in its rocking and sliding motion thus secures exactly the same effect as that produced by the more familiar methods of gearing, and the complete characteristics of the regular differential in every respect are manifested in the complete device.

In the various adaptations of the principle which have been designed, the use of the connecting lever having rounded or spherical ends, is sometimes supplanted by the use of spherical crank webs or eccentrics, while the intermediate member is hollowed to corresponding shape to receive them. This variation also is employed with plain eccentrics on the axle ends, mounting bushings having spherical exteriors which fit the corresponding recesses on the intermediate connecting part.

Several of the possible arrangements are shown in the accompanying illustrations.

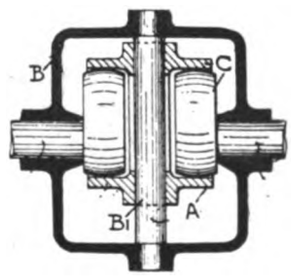

Fig. 3

In Fig. 1, the most elementary practical form is shown as adapted to the ordinary type of differential housing with bevel gear drive. The short transverse shaft, BB¹, is here shown mounted in the housing, while loosely mounted upon it is the connecting lever, A, the rounded ends of which interlock with corresponding recesses in the discs, C. The part A, is shown at one end of its travel. How its movement along its shaft is combined with a rocking movement about it in producing the desired balancing effect between the two shafts is seen to better advantage by reference to Fig. 2, where much the same arrangement is shown mounted in a different form of housing. The indices refer to the same parts as in the previous case.

In the variation shown in Fig. 3, the construction is changed to give heavier parts and more rigid and unyielding action by the reversal of the former design and the use of eccentric members on the shaft ends, which have spherical contours, while the connecting member is formed with large cylindrical openings to receive the eccentric members. While the action is the same in this case as in the preceding, the more massive design will be observed to be of advantage where very heavy vehicle work is in consideration.

In the arrangement shown in Fig. 4, the preceding plan has been followed with a little more elaboration by the insertion be-

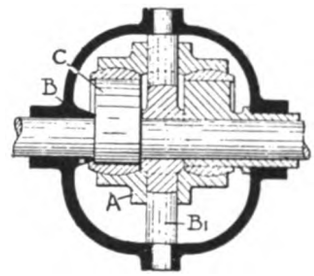

Fig. 4

tween the eccentrics and the openings in the connecting member, of bushings which are bored cylindrical inside, but shaped to the necessary spherical form externally. This arrangement, of course, serves to simplify the rubbing motion between the rocker or connecting link and the eccentrics, thereby tending to distribute the wear over an increased area of surface and prolong the life of the parts. The system is the invention of Reginald Donkin and was described in somewhat extensive detail in a recent issue of the Automotor Journal, London.

In this connection it is rather to be wondered at that with all the varied mechanical possibilities which might be aplied to the differential mechanism, so few, relatively speaking ever have been brought to notice in practical service. Indeed, saving the spur and bevel types, practically none have seen the light, while only a limited number of the possibilities of the differential clutch have been worked up into practical form. Were the differential in common use perfectly satisfactory, this would not be so remarkable. As it is, it would appear that designers as a class had been rather inclined in the past to let well enough alone rather than to "take chances" on mechanisms of unknown characteristics.

MAKING SMALL SALES PAY WELL

Enterprising Shoe Salesman Gathers Scattered Trade by Aid of an Automobile —His Story of Success.

Of the utility of the motor vehicle for the purposes of the traveling salesman, much has been said. Specific instances in which a saving has been secured in this way, however, are somewhat rare. On this account some little interest attaches to the experience of A. B. Brown, of Grand Rapids, Mich., salesman for a local shoe manufacturer. During the past six months, Brown has been using a Cartercar with a specially built body and in covering some 7,000 miles, has been enabled to keep his sales up to the average, despite the dullness of business in general, because of his ability to reach isolated customers readily and handle their trade with despatch. He says:

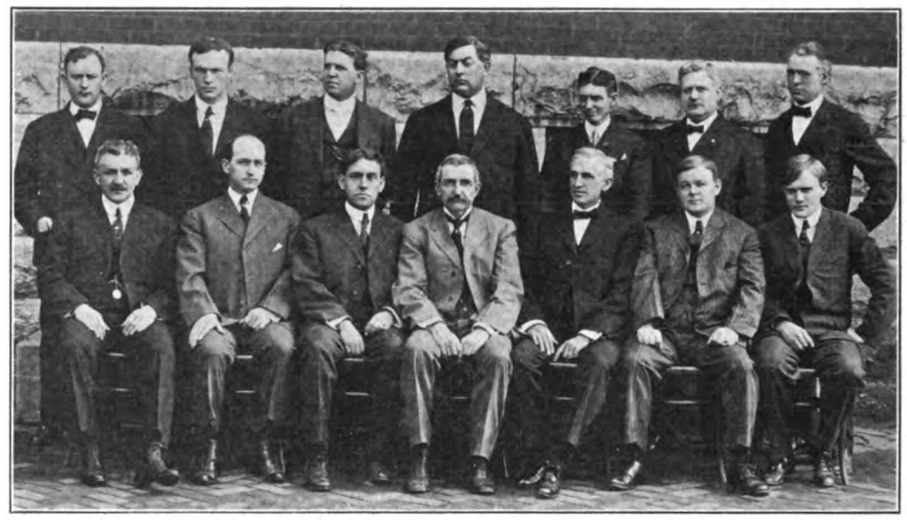
"I have been a salesman for a number of years, selling leather. I wanted to get to selling shoes and I wanted to sell in Michigan, but there was no territory that was not already covered, I was told. I believed that the company was mistaken, however. I secured a map and a gazetteer and proceeded to show them little dealers here and there, and proposed calling on them.

"The company was willing for me to go ahead, so I secured a team of horses, a wagon and a boy to care for them, and got busy. Orders came and I made it pay. I could get plenty of business, but the orders were all small. The only way I could increase my sales was to see more people.

"Finally the firm bought a car for me. I covered Michigan from lake to lake and from Indiana to as far north as the Saginaw valley. I make the territory with my car about every sixty days. I never stop for the weather.

"When I drove the team and kept the boy, my expenses ran $40 a week. With my automobile they do not average over $20 a week. My repair expense for the season has been a trifle less than $100, which includes two new tires which I now have. My automobile is far more reliable than a team of horses ever were. While no sale is large, I can call on a lot of small dealers in a short time and the total adds up nicely, showing a profitable business.

"In fitting up the car, I had the rumble seat removed and a case fitted on as shown in the picture. This is fitted with drawers, each containing a certain class of shoes. If the dealer is interested in a certain line, I take that drawer into the store and it takes about a minute to show him the entire line. In 15 minutes I have the order, the shoes replaced and am bidding him good-day."



SHOE SALESMAN'S SPECIALLY EQUIPPED CARTERCAR

WAVERLEY MEN IN CONFERENCE

Officers and Salesmen Meet at Indianapolis for Exchange of Ideas—Blending of the Old and New Elements.

This is the season of "conferences." They are being held all through the industry among the heads of firms, the heads of departments, among the members of the various subsidiary forces. Perhaps none of these assemblages are of more definite importance to the parent concerns than those occupying the attention of the selling forces. One such has just been held by the salesmen and officers of the Waverley Department of the Pope Mfg. Co., at Indianapolis, Ind. It was heralded as the most successful ever held, and assumed unusual significance because of the recent change in the status of the concern. It was a blending of the elements of the new and the old.

PARTICIPANTS IN THE WAVERLEY "CONFERENCE"

The accompanying picture shows the officers of the company and the members of the selling forces there gathered. Reading from left to right, those seated in the lower row are: H. W. Goodman, Charles M. McAlpin, purchasing agent; Herbert H. Rice, vice-president and manager; Carl von Hake, treasurer; William B. Cooley, president; Wilbur C. Johnson, secretary; Roy A. Potts, sales manager.

Those in the top row, from left to right, are: E. K. Shugert, R. T. Davis, P. W. Eigner, K. W. Brewer, H. W. Dickerman, E. R. Vincent, W. S. Gilbreath.

Bill Posting Firm Adopts Motor Car.

A unique application of the commercial possibilities of the motor car has just been brought to light in the recorded sale of a Franklin air-cooled truck to the C. J. Gude Co., a firm which handles a vast area of out-of-door advertising space for the education of suburban railway and trolley travelers.

AUTOMOBILE LAW COLORS POLITICS

Why Jersey Club and Trade Associations Entered a Senatorial Fight—Demand for Fairer Legislation.

No small stir has been created among the ranks of New Jersey motorists over a little incursion into politics undertaken prior to the recent election by a joint committee acting on behalf of the Associated Automobile Clubs of New Jersey and the New Jersey Automobile Trade Association. The incursion took the form of a circular letter sent out broadcast to motorists giving the views of Senator Colby and Harry V. Osborne, the Democratic candidate, on the question of a revision of the motor vehicle law. No doubt could be left in the mind of the reader as to which candidate the committee wished to favor, nor that Colby, who though he evidences an abundant sense of fairness in other matters, appears to have small idea of justice in matters where motorists are concerned, was subject to attack.

Immediately after the sending out of the letters prominent members of the federation began to issue denials of the committee's authority in taking its stand, a counter-current of newspaper criticism was induced and the inevitable factional movement sprung up. In answer to the criticism of the committee's action, W. C. Crosby, acting president of the associated clubs issued a defensive statement showing the underlying cause to be an earnest desire on the part of the motorists to secure a reformation of the present repressive law. He said in part:

"Senator Colby, in an interview prior to the exchange of the letters sent with circular letter to the automobilists, made the remark voluntarily, in response to an expression that the automobilists did not desire to enter into politics, but desired to get fair and equitable laws by personal representation and argument, 'the automobilists will have to go into politics in order to get what they consider right.' Senator Colby also voluntarily gave expression to the policy or spirit, 'that the automobilists were entitled to know where the candidates for office stood in connection with the several amendments desired by automobilists and would be pleased to give his expression on the various amendments'—which he did in response to the letter sent to him by the chairman of our committee, and the committee are unanimously of the opinion that Colby expected that the letter would be used for what it might be worth.

"The committee deemed it best, in view of the letter and the spirit of the interview, to place the matter squarely before the automobilists, that they might know where Colby stood—and we still believe that Colby wanted the automobilists to know where he stood—and leave the matter in their hands. No appeal for votes was made, but an honest, frank statement for the edification of the automobilists as to where the candidates stood on the desired amendments. . . . .

"As for the amendments we ask for, or are fighting for, they are concisely as follows: We want lights on all vehicles at night. We want reciprocal privileges extended to non-residents that non-resident automobilists may exercise their privilege to travel through or over the roads of a neighboring state without taxation. We want a speed regulation that when enforced will secure to all users of the highway safe and happy enjoyment of all privileges of the highway, and we do not want a law which makes every automobilist a criminal and subject to the pleasure or whim of every justice of the peace in the state who desires to arrest automobilists and filch from them small fines and large costs to his own pecuniary benefit.

"Regarding lights on vehicles there should be no discussion, yet we find our legislators, while favorably inclined personally, vote against it, but claim they are and will work for it." . . . .

A similar stand was taken by J. H. Wood, secretary of the joint committee who carried the argument even further.

"Politics has not in any way entered into the consideration of this committee," he declared. "Our demands upon the legislature have been made for principles and for policies which can only be called for by good business judgment. We believe that an industry, which according to statistics which have been gathered by the Trade Association has resulted in a business of over twelve million dollars in one year to the manufacturers and tradesmen of Newark, should receive every consideration at the hands of our legislators. . . . . Should not, therefore, our great manufacturing interests, such as leather, paint, varnish, drop forgings, radiators, battery supplies, wheels, tires, etc., be considered by our legislators in the making of such laws as will benefit them, as well as for revenue for the maintenance of the highways over which these materials are to be carried?

"While the New Jersey license on our cars will carry us from New Jersey to the furthermost point of Maine, entitling us to every courtesy and protection and right in the use of the highways of other states, the non-resident from these same states as soon as he crosses the line into our state is a criminal until he has increased the treasury of the state of New Jersey by paying $14, and is compelled to go in person without any identification to make this registration, and is furthermore compelled to appoint the secretary of our state his attorney. . . . .

"As to Mr. Colby's contention that there are 100 automobiles coming into this state to one going out of it, I take serious exception. Unfortunately, there is no way of getting at definite facts in this matter, but we might take one or two facts for illustration: There are probably no less than one hundred automobiles daily go from Essex and Hudson counties during the summer months to Coney Island. During the Vanderbilt cup race on Long Island over 2,000 automobiles crossed the ferry on Friday afternoon and evening from Jersey. Just imagine this vast throng of machines being held up when they crossed the ferry and compelled to make personal application for a license, pay $14 and give the Secretary of State of New York power of attorney. We not only believe that we are right, but we believe that the community in general agree with us that we are right in this principle that a limited tourist's privilege should be extended to non-residents to come into our state the same as is in effect in New York state and the New England States."

While motorists outside the state and others conversant with the situation will be likely to view the movement with no small interest and appreciation for the activities of the New Jersey owners and dealers, they will probably agree in regretting that this attack should have been centered upon such a man as Colby, while that star player to the galleries and author of the obnoxious measure, Senator Frelinghuysen, who maintains a home in New York City, but continues to vote in New Jersey, remains untouched and thus far, unaffected.

Ohio Law Bothers Kentucky Visitors.

Because Kentucky has no automobile license law a queer situation has arisen in connection with those of its residents who own machines and wish to operate them in Ohio. The law of the Buckeye State provides that residents of other States who conform to the regulations governing them at home will not be required to take out a license to use their machines within the Ohio borders, the registration and tag of the home state being sufficient. But when H. Clay McKnee arrived in Cincinnati from Sterling, Ky., he was stopped by the police. He explained his position satisfactorily there, but was again stopped at Dayton, O., after which he appealed to Dayton's mayor to know what he should do. He was advised to head for Columbus, the state capital, and get an Ohio license in order to avoid further trouble. Upon the understanding that he would do so he was permitted to proceed.

Kansas City Park Board Favors Motorists.

A liberal attitude toward motor cars has been taken by the authorities of Kansas City, Mo., and as the result of a recent meeting of the park board, automobiles will be allowed to go at 18 miles per hour. Furthermore, the machines may now use the Cliff drive, which has heretofore been reserved for horse-drawn vehicles.

COP CONVICTED FOR PISTOL PLAY

Glencoe's Celebrated Case Turns Against Special Policeman—Shooting at Automobilists Declared a Crime.

Shooting at motorists will no longer be one of the playful pastimes of Frank H. Moor, the special policeman of Glencoe, Ill., who on July 11 fired a bullet at the automobile of T. J. Henderson and struck a button on the dress of Miss Buena Stribling, a passenger in the machine. Moor has been declared guilty of assault with intent to do bodily harm and is now awaiting the outcome of his attorneys' efforts to get a new trial before receiving the pronouncement of his punishment from Judge Mack.

The trial took place in Glencoe last week, and after the evidence was all in, the jury took five hours to come to a decision. It is understood that almost half the jurors wanted to bring in a verdict that would have more serious consequences for the defendant, as he had been charged with assault with intent to kill. Moor, on his first arraignment before the local magistrate at Glencoe right after the shooting, was exonerated, but the state attorney's office took up the case with the result that it was brought before the grand jury, where an indictment was obtained.

Miss Stribling, who so narrowly escaped death from Moor's bulet, was one of four occupants of Henderson's car as it was passing through the town. The officer called upon Henderson to stop, on the ground that he was violating the speed ordinance, but Henderson refused to do so. Moor then took three shots at the machine with the purpose, he declares, of puncturing the gasolene tank. But the shots went into the woodwork of the tonneau instead, one of them striking Miss Stribling in the back, but being harmlessly deflected by a large button. The tonneau itself was exhibited in court.

In his defense Moor asserted that he was an expert revolver shot and that he could kill running rabbits at 100 yards with the pistol, so that he had felt safe in shooting at the gasolene tank. Furthermore, he said that the village attorney had advised him to shoot in case automobilists would not stop.

The trial made it clear that neither village constables nor officers of any other description have the right to shoot at a misdemeanant, or to throw clubs or commit other like assaults. A police officer many only shoot at a felon, and then only where there is grave danger of the latter's escaping. Exceeding a speed limit is a misdemeanor, according to the prosecution, and a policeman who shoots at an automobile party is as much liable to the law as any private citizen.

The case has become one of the most celebrated in the local history of motoring, because of its connection with the war waged by the Chicago Automobile Club against the town authorities of Glencoe for the maintenance of a system of trapping motorists, which was alleged to be unlawful.

Philadelphia Presses for Motor Bus Taxes.

Accused of owing Philadelphia from $6,500 to $10,600 for municipal licenses and pavement tax, the Auto Transit Co. of that city, which has been operating motor buses on Broad street, is threatened with legal proceedings which will stop the running of the machines. Under the law it is necessary that licenses be taken out every year, at the rate of $100 for each omnibus, which for the 25 machines operated by the company amounts to $2,500. It is alleged that no licenses have been taken out by the company for this year, the last payment being in July of last year for the 1907 period. In addition to the license charge the company is obliged to pay 2 cents per square yard per annum for each square of paved street on which its buses operate, which amounts to about $4,000 or $8,100 for the current year, according to how it is figured. The city claims that the charge should be for the whole width of the street, while the company maintains that the charge should only be for the side strips where its machines run, and not for the center. The city, however, has given official notification that the company must pay at least the smaller amount at once or its vehicles will be stopped. Peter J. Hughes, president of the company, intimates that a reorganization will take place shortly.

Interurban Wheel Tax Agreement.

Since both Evanston and Chicago, Ill., have recently instituted the collection of a "wheel tax" on all vehicles in their borders, several owners who divide their time between the two have been put in the position of having to pay in both places. Their indignation at having to pay a "wheel tax" in even one place was of considerable warmth, but the prospect of having to contribute to both municipalities brought it to an extreme temperature. Matters have been fixed, however, so that Evanston and Chicago will hereafter acknowledge each other's tax tags, so that the owner who has paid in one place will not be required to pay in the other.

Charlotte Refuses to Banish Garages.

If Alderman Chambers, of Charlotte, N. C., could have his way all the garages in town would have to move outside the municipal fire limits. He introduced an ordinance to that effect before the board of aldermen, but the latter, at a meeting on the 2d inst., rejected it promptly as too severe. The board indicated, however, that it will shortly pass a set of regulations governing the conduct of the local garages.

ENFORCING MASSACHUS

Highway Commission Deal Two Cases in Four Mont fenders Were Dealt

In explaining the work setts Highway Commissi licenses in the State, Co Sohier, a member of th cently reviewed the he commission together with their resu "During the four months of July, August, September and October," he said, "the Highway Commission has given 62 hearings in automobile cases. Eleven of these hearings related merely to the reissuing of licenses which had been revoked or suspended for various causes. There were eight hearings on the complaint that automobiles were going too fast around corners, two for not stopping when signalled by an officer, seven for improper operation, generally for passing upon the wrong side or crowding in between teams. Five complaints were because the automobile was taken out without the consent of the owner, and in all of these the license of the chauffeur was revoked. There were five hearings on complaints of reckless operation.

"The law in Massachusetts now provides that when death ensues from an accident in which an automobile is involved, the license of the operator shall be suspended and shall not be reissued unless, after investigation or upon a hearing, the commission determines that the accident happened without serious fault on the part of the operator. Eight licenses have been suspended under this statute and there have been only three hearings requested. In two of these the license was returned, as it was evident that the operator was without serious fault; one was refused, and no application for reissue has been made on the part of the others."

Movement to Check Glass Throwing.

Big posters announcing a $25 reward for the arrest and conviction of persons throwing or leaving glass or nails in the public highway are being distributed and pasted up by the New Jersey Automobile and Motor Club, of Newark, N. J. All of the garages are being supplied and the bills are also being prominently displayed at conspicuos places not only on the city streets, but on roads in the surrounding country.

Motor Cars Link Two Texas Towns.

Denton and Krum are glad that automobiles were invented. They are two Texas towns, which after long pleadings in vain for a connecting railroad, now have a motor vehicle line which links them. Dallas capitalists are back of the enterprise.

$25,000,000 ASKED FOR ROADS

Bill Providing for System of Trunk Highways Introduced in Vermont Legislature—Outline of the Plan.

An appropriation of $25,000,000 is being asked of the Vermont legislature for a series of trunk highways through the State. The bill has been introduced by Representative Howe, of Bennington, and has the strong support of all the automobilists. His plan provides for two main highways running north and south the entire length of the State and six intersecting lines running east and west. One line would start at Pownal, on the Massachusetts State line, and run through Bennington, Rutland, Addison, Chittenden and Franklin counties, touching the more important places, such as Bennington, Manchester, Rutland, Middlebury, Vergennes, Burlington and St. Albans. Another would start at Vernon, on the southeastern boundary, and follow the Connecticut river as far as Barnet, then branching off through St. Johnsbury, Lyndon and Barton to Newport.

One cross line would run from Bennington to Brattleboro, another from Manchester to Springfield, a third from Poultney to White River Junction, the longest one from Burlington along the Winooski valley to Montpelier, thence through Orange county to White River Junction; the fifth from Burlington through Lamoille county to St. Johnsbury and Lunenburg, and the sixth from Alburgh, in Grand Isle county, across the northern part of the State, through Richfield, Troy and Newport, to some point on the New Hampshire line.

The original plan for this system of roads was advanced some years ago by Dr. W. Seward Webb, of Shelburne, but at that time it evoked considerable opposition from the farmers on the ground that Webb wanted it simply as a means for getting better roads for his coaching parties, of which he was known to be very fond. Similar objections that motorists will be the chief beneficiaries are being made at present, but the agricultural interests as a whole seem well disposed toward the plan. Howe's bill provides for the expenditure of $150,000 a year until the roads are completed.

Kulp Held to be Very Culpable.

Imprisonment as well as a fine was imposed on Ellis H. Kulp, a demonstrator for a New York automobile concern, in the court of special sessions last week. The sentence was for 20 days in the city prison and the fine was $150. The severity of the sentence was due to the fact that after being arrested for speeding, Kulp twice escaped the motorcycle policeman and tried to run away. His first dash for liberty was in Van Cortlandt Park, where he was caught and held up at the point of a revolver. After apparently surrendering, he again started his car at full speed, leaving the policeman in the lurch. He was finally captured the second time and taken to jail by force. Simon R. Weil, who was in the car with two women, made an affidavit to the effect that in trying to get away, Kulp drove so fast that the women became hysterical. This affidavit, together with letters from Commissioner Bingham and the Automobile Club of America, asking that Kulp be made an example of, were read to the court before sentence was passed.

Demands Enforcement of "Lights" Law.

Enforcement of the ordinance passed ten years ago in Chicago through the efforts of the cycling clubs and requiring all vehicles to carry lights at night, is being sought by the Chicago Motor Club. The ordinance has never been enforced so far as horse drawn vehicles are concerned, but the club thinks that it should be, as many accidents of recent date are directly due to the fact that wagons and buggies have been without lamps. Carl J. Metzger, chairman of the grievance committee, will undertake the work of compelling the city to see that the ordinance is lived up to and also that the rules of the road, as set forth by Chief of Police Shippy are observed by horse drivers. It is Metzger's idea to oblige all vehicles to carry both side lamps and a red light in the rear.

Automobile Club Improving Streets.

When the citizenry of Galesburg, Ill., see a few of their streets being relaid with the most modern concrete pavement in place of the present rough succession of bumps and mud holes which now exist in some parts of the municipality, and learn, further, that the new pavement is not costing the city government a cent but is being paid for by the Galesburg Automobile Club—perhaps they will feel kindly toward motorists and will be shamed into putting the balance of the pavements in such good order that cars may go back and forth on them without risk of damage. At any rate, the club has it all figured out that way and is circulating a subscription list among its members and some of the property holders, to carry out the plan.

Springfield Club May Establish Traps.

Hinting to visiting tourists that they should "be good," the Automobile Club of Springfield, Mass.. has printed cards for display in hotels and garages calling upon all motorists to use the highways in a safe and sane manner. It is pointed out that failure to observe the request will result in the establishment of speed traps by the club. Upon their own initiative the directors of the club have decided that this the the only alternative, and they are preparing to put such a plan into action unless the warning notice takes effect.

JOYLESS END OF JOVIAL RIDE

Taximeter Cabby's All-Night Job Results in Sensational Shake-Down—Tires and Passengers "Busted."

Having carefully schooled himself in taximeter cab drivers' etiquette, such as never looking back to see what his passengers are doing, never being surprised at anything, and never expressing complete satisfaction with the tip, Pat Shields felt qualified to range New York City as the real thing, particularly as he had a shining new machine. Upon driving up to the curbstone to take his stand he was hailed by three jovial visitors from Center Moriches, L. I., whose uncertain legs were hardly capable of heavy transportation service for the rest of the evening. They piled in and told Shields to keep going and show them the town. Frequent tappings on the glass instructed him to pull up with equal frequency before brilliantly lighted entrances where good cheer and carelessness in a variety of liquid forms and an equal variety of enticing combinations, were bought as so much per round.

As the white milk bottles began to appear on window ledges and steps, the cab whirled uptown, toward the all-night gaiety resorts near 110th street, the upper boundary of Central Park. The machine ran along the western side of the park, until the jovial visitors insisted that Shields turn in at an entrance gateway that appeared. With a swerve that sent the unsteady passengers in a heap to the floor, the driver headed through the gate, into the park blackness, and after a moment of smooth running the cab leaped out into empty space. Its flight was brief, however, and the heavy machine came down with a bump that burst three tires, and continued to pound its way down to the bottom of the broad flight of stairs which Shields had mistaken for the road. Shields was knocked from his seat and the passengers were shaken out, one by one, on the stone steps, later gathering themselves up in a flower bed into which they had rolled. The cab disappeared over the roadway and across a lawn, and while Shields went looking for it, the visitors, with arms about each other's necks, stumbled toward a distant white light corner. There it was that the driver later found them, drinking champagne and hailing his appearance with joy. He did not want wine opened in honor of his being alive, but demanded $20 fare. His passengers said he had shaken them down enough already, and compelled him to take them to the police station. Shields related his trouble and said that $20 would not even cover the cost of the tires that had burst, but the good offices of the police sergeant finally induced him to accept the trio's remaining $11 and to let it go at that.

The Week's Patents.

895,030. Spark Plug. James Lang, Cavalier, N. D. Filed Nov. 25, 1907. Serial No. 403,774.

1. A spark plug of the character specified, comprising an outer casing, formed at its inner end with a laterally extending finger, a central tube arranged within the casing, the outer end of the tube being screw threaded and projecting beyond the outer end of the tube to retain the same in position, a sleeve of insulating material arranged between the casing and tube, the outer end of the sleeve being formed with an out-turned flange to engage the adjacent end of the casing, a central conducting core extending longitudinally through the plug, the inner end of the core being formed with a laterally extending finger, a sleeve of insulating material arranged between the conducting core and tube, and electrical connections for connecting the spark plug with a source of energy.

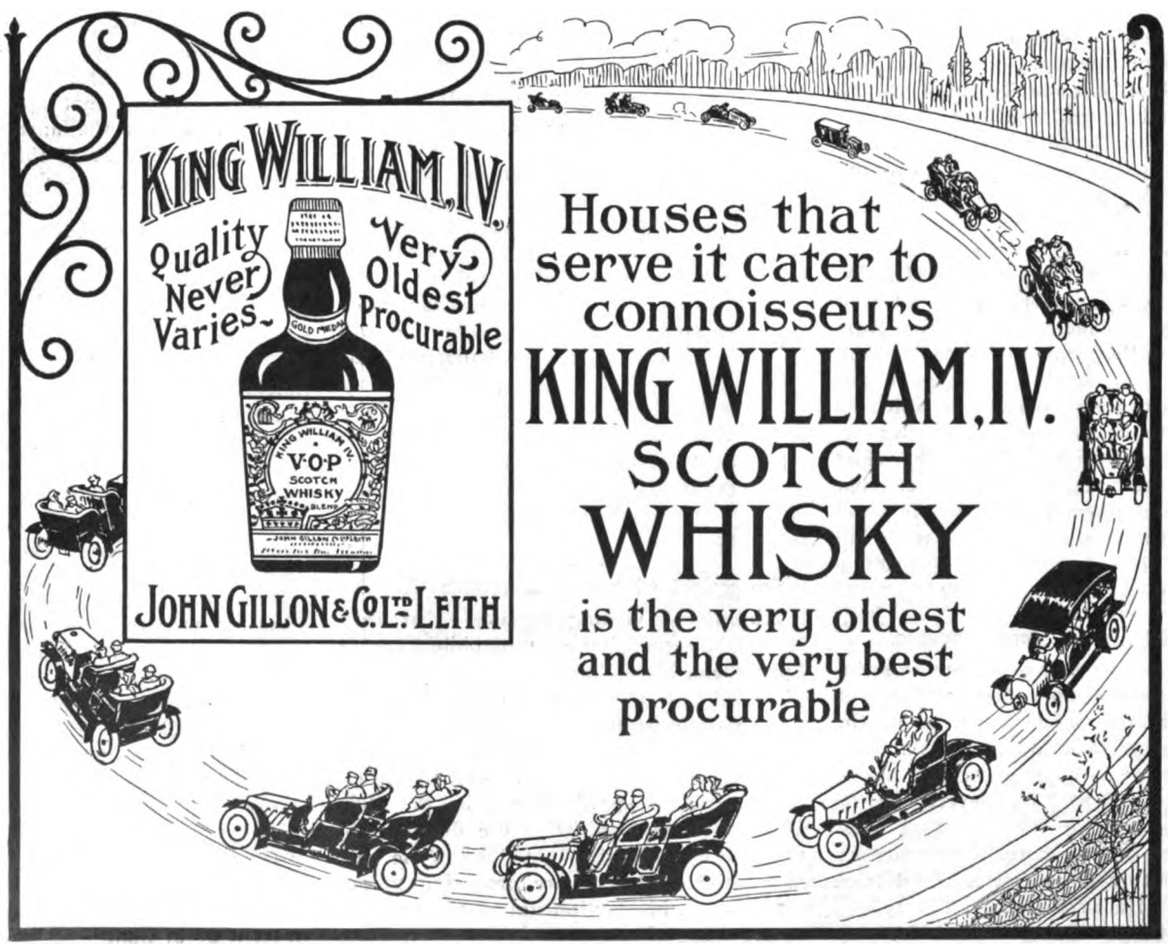
895,111. Vehicle Wheel. Nicholas Schenk, St. Louis, Mo. Filed Dec. 22, 1906. Serial No. 349,039.

1. A vehicle wheel comprising a hub, an inflated tube located upon said hub, plates located on each side of the inflated tube, a solid rubber tire supported by the plates, rollers carried by the plates to be adjusted to contact with the tube and means for imparting motion to the rim to coact with the movement of the hub, substantially as specified.

895,127. Vehicle Wheel. Gabriel G. Trannoy, Charenton, France. Filed May 31, 1906. Serial No. 319,633.

1. A vehicle wheel comprising a rim portion having side members projecting inwardly around it and spaced apart to produce a chamber between them, a hub having a disc-like member projecting in annular arrangement from it and fitted for edgewise sliding movement in said chamber, springs affording connection between said disc-like member and the rim portion, said disc-like member being of less thickness than the chamber between the side members, and wearing plates of anti-friction metal held upon and projecting from the opposite faces of the disc-like member and contacting with the inner faces of the side members to hold the disc-like member out of contact with said side members.

895,113. Shock Absorber. James A. Scott, Los Angeles, Cal. Filed April 11, 1907. Serial No. 367,704.



1. A shock absorber comprising a pair of concentric non-revoluble conical discs, a rock arm having a hub conically recessed in opposite sides and lying between said discs, a washer between each disc and the adjacent conical recess of the hub, yielding means for contracting the space between the discs to produce the desired pressure between the washers and hub and discs, said discs being supported by one of the relatively moving parts of the vehicle, and a cushioning link connected at one end to the end of said rock lever and at the other end to the other relatively movable part of the vehicle.

895,225. Spark Plug. Willis L. Ash, Lansing, Mich. Filed Oct. 11, 1905. Serial No. 282,244.

1. A spark plug embodying an insulator, an electrode having threaded ends extending through an opening provided therefor in said insulator, a cap having a closed end and formed with a threaded opening receiving one end of said electrode, a sparking point projecting beyond the outer face of said closed end, said cap at its open end being formed with an annular cup shaped recess which merges into said threaded opening of the cap whereby a downwardly hanging protecting flange is formed an elastic cushion seating in the said recess, a second cap having an opening through which the opposite end of said electrode passes, an annular dish shaped spring washer perforated and receiving said insulator and disposed between the last named end of the insulator and the end of said second cap, and a securing nut on the electrode bearing against said second cap.

895,245. Elastic Suspension for Vehicles. Claude L. Le Duc and Louis Garchey, Paris, France. Filed June 18, 1906. Serial No. 322,296.

Boxes for the elastic suspension of vehicles which leave the body of the carriage free to displace itself in any direction serving merely to limit and weaken the displacements of the body, comprising in combination a box rigidly connected with the axle, a cross bar rigidly connected with the body of the carriage, traversing said box, discs fixed to the upper and lower surface of said cross bar inside the box, segments forming ball bearings, vertically arranged on the periphery of the piston formed by the two discs, balls in said bearings running on the inner surface of the box, elastic means between the segments and the cross bar and elastic buffers between the upper cross bar disc and the top plate of the box on the one hand and between the lower cross bar disc and the bot-

Digitized by Google

tom plate of the box, substantially as described and shown and for the purpose set forth.

895,542. Transmission Gear. James F. Duryea and William M. Remington, Springfield, Mass., assignors to Stevens-Duryea Company, Chicopee Falls, Mass., a Corporation. Filed July 15, 1907. Serial No. 383,772.

1. In a sliding gear transmission mechanism a casing, sliding gears mounted therein, a gear sliding lever having forked arms, the spread of which is greater than the diameter of one of the sliding gears, there being an opening through the casing inclosing the gears through which said lever may be dismounted from its bearing, whereby it may be passed over one of the gears with which it engages to remove it from the casing.

895,554. Vehicle Wheel. Andrew Graff, Wellington, Kan. Filed April 16, 1906. Serial No. 312,027.

1. A vehicle wheel having a helical rim which is wrapped with a small gage wire fitted in the spiral channel formed between the whirls of the helix.

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.

¶ SUPPLEMENTARY SPIRAL SPRINGS take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.

¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

SUPPLEMENTARY SPIRAL SPRING CO.

Motor Mart, New York — 4555 Delmar Ave., St. Louis, Mo.

STEVENS-DURYEA NEW MODEL X

supplies the demand for a four-cylinder car, a little larger and more powerful than the Stevens-Duryea four-cylinder Model R, which has been discontinued. The owner of the Model X can feel that the well-known features of the Model R are embodied in his car together with the advantages of more room and power.

The Model X is an enlargement and refinement of the Model R, representing the most advanced ideas in automobile designs together with Stevens-Duryea construction and workmanship which have been proven absolutely correct.

Price, with standard finish and equipment **$2,750**

HAYNES 1909

Cars That Go Are the Cars That Sell

Haynes cars run. They always run. In the agents' parlance they "stand up."

Dive into the Haynes mechanisms and you will see why.

There's a clutch that is really jerk-proof, working like a contracting band brake, metal to metal, so that you cannot convey a shock to the motor if you try. That means long motor life.

No leather to renew on the clutch—long clutch life.

A ratchet in the gears preventing stripping—long gear life.

Brakes water-cooled, non-burning—long brake life.

A unique direct drive system that saves wear, friction, thrust and noise and solves the old rear axle problem. Long life there.

Solid, substantial construction all over—long life all over.

No wonder the two Haynes cars were both among the five that won perfect scores in the great Chicago Motor Club Reliability Run.

The Haynes always makes a perfect score.

AGENTS!

Do you realize what such facts mean to you? Your profits are not eaten up by efforts to keep the cars running after they are sold.

And when the result of a big Reliability Run is telegraphed to every paper in the country with Haynes Perfect Scores always sticking up in the record like the proverbial sore thumb—do you see where you get off if you have the rights in your territory? We're ready to talk business.

Digitized by Google

To give genuine, unadulterated satisfaction it is absolutely necessary that a speedometer be equipped with a strong, properly constructed Flexible Shaft and Swivel Joint

Always on the Job service

can not otherwise be guaranteed. Motorists who have had long experience with speedometers know that the wire core and riveted type of flexible shaft can not be considered the equal of the famous Stewart link type of shaft, the result of twenty years' experience as the largest manufacturers of flexible shafts, and that no flexible shaft can possibly give continuous service unless used in connection with a swivel joint. **The small, compact, internally-locked Stewart Swivel Joint** is not to be confounded with clumsy, complicated non-swivel devices being used to fill the demand our Stewart Swivel has created for a device to protect users of speedometers against the shaft breakages and annoyances caused where this swivel is not used.

The famous Stewart Flexible Shaft and patented Swivel Joint are used on all Stewart Models at $40, $25 and $15. We don't sacrifice quality to make price. Our $15 instrument includes an Odometer and has the same shaft and swivel as used on our $40 model

Our instruments are complete and guaranteed for five years

"Ready for the Road"

AND

TRUE TO ITS NAME

"JEWEL"

40 H. P. and COMPLETE $3000

¶ A suggestion of its completeness:

Rutenber motor, Bosch magneto and battery; selective transmission; platform spring suspension; Hartford shock absorbers; best grade Timken axles with Hedgeland equalizer; 36-inch wheels, Diamond tires, 4-inch front, 4½-inch rear; full top and wind shield; complete lamp equipment, with large size Prest-O-Lite gas tank; extra tire holders, etc.

¶ Sounds a lot for the money and it *is* a lot for the money. We have pride in our product, which is limited, and practically no overhead expenses. We have got right down to earth and put together the best car we know how, with every part of standard material that can be purchased anywhere.

¶ There isn't any guess-work in the Jewel car.

¶ There wouldn't be any guess-work in the mind of any honest agent who aims to give his customers the most he can for the money.

¶ There's a lot of honest agents, too, whose business we can't handle—for, as stated, our output is limited. To the few who speak quick enough, we'll offer an attractive proposition and we'll make good on everything we say. Try us.

WINTER SUGGESTIONS

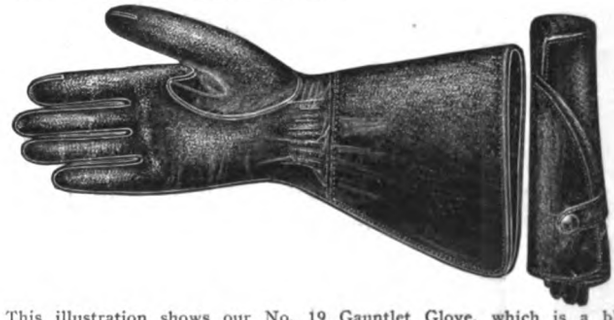
We have a large line of Leather Clothing, Caps, Gloves, Wool Vests, Wool Boots, Ways Mufflers, Storm Coats, Lap Robes, Etc.

ARGYLE AUTO BOOTS

Worn over Shoes for Comfort in Cold Weather Motoring.

The ARGYLE Auto boots are designed to give the motorist's feet complete protection from the elements during winter weather motoring. They are worn over the ordinary shoes and can be pulled on or off very readily. They will keep your feet warm and dry during the longest ride in coldest weather. You cannot realize the comfort they give in frigid weather, till you have worn a pair.

Every man, woman and child who motors in cold weather needs a pair of ARGYLE Auto Boots, no matter whether the time of exposure is a half hour or a whole day.



They are made of fine flexible leather, have strong leather Goodyear welted soles and are warmly lined throughout with genuine lambs-wool.

Made in all sizes, with long or short leg. Length of the long leg is 13½ inches,, and the short 10½ inches.

PRICES:

Long, per pair $9.00
Short, per pair 8.00

NO. 19 AUTOMOBILE GAUNTLET GLOBE

This illustration shows our No. 19 Gauntlet Glove, which is a black, seamless knit lined Automobile Gauntlet with extra large flexible cuff with 2 fastenings. This Gauntlet is made from the best selected imported black cape leather. It has a 7-inch Gauntlet with extra large cuff, 20 inches in circumference, which may be adjusted to smaller sizes. The cuff is lined and is guaranteed not to crack, and is stitched with genuine silk.

It will also be noted from the illustration, that the wrist is fitted with an elastic band, which will keep the Gauntlet tight, and comfortable on the wrist, and prevent it slipping down over the fingers.

The cuff is also flexible, and can be rolled into a small space, as shown in the small illustration, for carrying in the pocket. This is the finest Gauntlet Glove on the market.

Price, seamless knit lined, per pair $3.50

SUPREME FROM COAST TO COAST!

THE WARNER AUTO-METER

Demanded Wherever Autos Are Used!

IN THE EAST

Sweepstakes Races

Four of five of the winning cars depended on Auto-meters. Here are the winning cars all equipped with Auto-meters. Nassau Sweepstakes, Buick, driven by Hugh Easter. Jericho Sweepstakes, Chalmers-Detroit, driven by W. R. Burns. Motor Parkway Sweepstakes, Isotta, driven by Herbert Lytle. Meadow Brook Sweestakes, Allen Kingston, driven by H. Hughes.

MIDDLE WEST

Chicago thousand-mile endurance run

Four of five winning cars relied on Auto-meters. On the two Haynes cars which finished with perfect scores the Auto-meters varied only $\frac{1}{10}$ of a mile each. A wonderful performance in a thousand mile run.

IN THE WEST

Los Angeles twenty-four hour run

Six of the seven cars that entered, and those that finished first, second and third, all were equipped with Auto-meters.

The winning drivers knew beforehand the Auto-meter could be relied upon under the most trying conditions of weather or track.

The Warner Auto-meter is the speed gauging instrument which is indorsed by the leading automobile manufacturers, famous drivers, and the elite of motordom. It was used on the Thomas Car in the great New York to Paris Race.

The Glidden Tour Pathfinders and Route Makers always use the Auto-meter when laying out their routes. They accept the Auto-meter's record because they know its authority.

The Auto-meter has won its way to supremacy because in its construction, quality, accuracy, reliability, endurance, and dependability is more of a consideration than a concession in price.

Write for catalog explaining why it is the authority on speed and distance.

The Value of the AJAX 5,000 Mile Guarantee

is known and appreciated by every individual **AJAX** user. It also finds substantial recognition at the hands of the automobile manufacturer who knows better than any one how vital the tire problem is to the motorist.

No wonder, then, that careful buyers and conservative manufacturers like the **Maxwell-Briscoe Motor Comapny** give to the **AJAX** the largest tire order ever received by a single tire firm.

Incidentally they give to their customers the benefit of the **AJAX five-thousand mile guarantee,** which insures the user against tire worry and gives him a security that no other tire maker can afford.

MAXWELL-BRISCOE MOTOR CO. NO. 2146-T

MANUFACTURERS OF "The Maxwell"

THIS NUMBER MUS APPEAR ON INVOICE

TARRYTOWN, N. Y., 9/19, 1908.

Matheson

1909
Prices Reduced $1,000
And the Reasons Why

Heretofore the Matheson Car has been considered the highest priced as well as the highest grade American car on the market.

Millions of dollars worth of these cars have been delivered to customers who could afford to pay the higher price for the best.

Many other purchasers have been persuaded that some of the lower priced cars have been "just as good." Matheson owners who have used other makes of cars have answered that question satisfactorily. Send for their letters, which we have done up in a book.

In order, therefore, to still maintain the unequalled quality of the Matheson Car and at the same time give customers this magnificent car at the price of the cheaper cars, the makers have figured that by doubling the factory output and selling at a much closer margin of profit, the price of the Matheson Car equipped with Touring, Landaulet or Limousine bodies, could be cut $1,000, and the same chassis, equipped with Roadster or Tourabout bodies, cut $650.

Accordingly, the Company's working capital has been increased by $350,000, and after October 11, 1908, the purchaser can buy a genuine Matheson Car, the very finest of all motor cars of either European or American make, at the makers' former prices to the agent or dealer; namely:

	New Price	Former Price
50 H. P. 1909 Touring Car	$4,500	$5,500
50 H. P. 1909 Roadster	4,350	5,000
50 H. P. 1909 Tourabout	4,350	5,000
50 H. P. 1909 Limousine	5,500	6,500
50 H. P. 1909 Landaulet	5,500	6,500

VICTORIES

The great string of Matheson victories in the important speed, hill climbing and endurance contests of the past seasons, in competition with the greatest cars of Europe and America, can leave no room for doubt that the Matheson car has no peer on any market to-day.

GUARANTY

Every Matheson is guaranteed for 365 days. (Notice that most other cars are guaranteed for 60 to 90 days only.)

ATTENTION MR. PELLETIER

Everitt-Metzger-Flanders Co.,

Detroit, Mich.

Gentlemen:

Referring to the E-M-F Ad. in the Automobile of November 5th, we wish to compliment you on it's get-up. It certainly "hits the nail on the head". While we have not been mentioned among those of the successful E-M-F dealers we do not believe it would be amiss to advise that we have up to date taken deposits and have them safely in the bank on 50 cars and have contracts signed and expect deposits to reach us in the near future on 42 additional cars making a total of 92 sales out of possibly 150 our present allotment. This does not include 50 cars contracted for by the Willis-Haywood-Holcomb Co. retail dealers here at Indianapolis, so out of the 200 cars alloted to Indiana there has already been contracted for 142 leaving us 58 cars yet to dispose of.

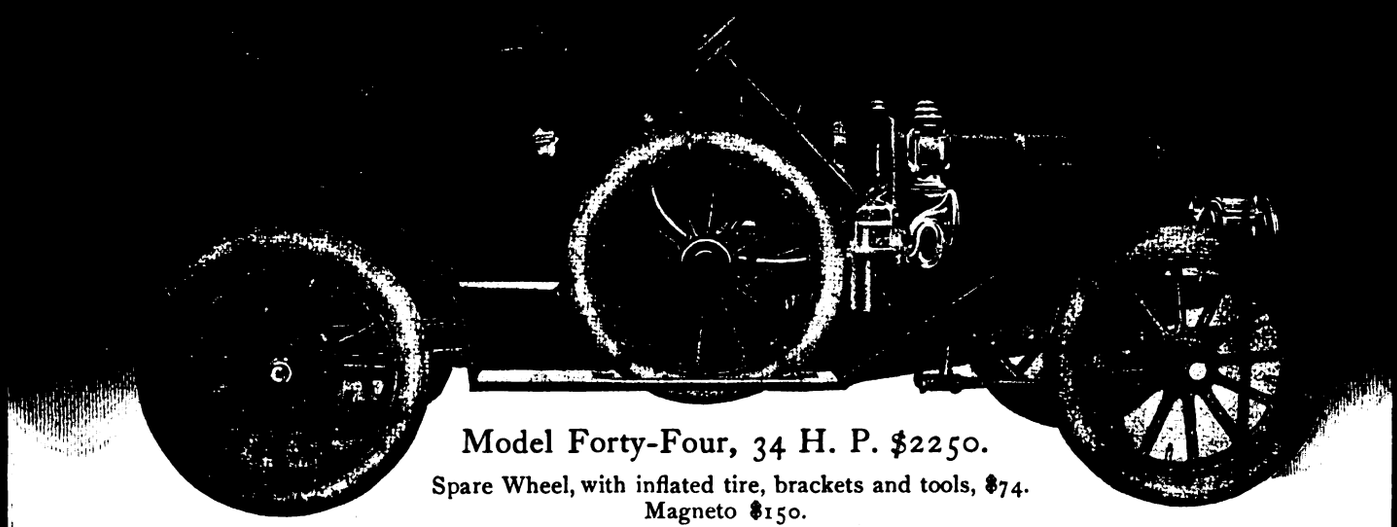
Believing that this information will be of interest to you and assuring you that we will be pleased to have you use it as you deem best for the interest of the E-M-F Motor Cars, we are

Yours very truly,

THE MOTOR CAR SALES CO.,

B. W. Twyman

Mgr'



BWT/ES

P. S. Even in the Hoosier State we find very little trouble in selling a good quality of "Blue Sky" as you will note by the above.

Ray - Sorry Twymans name wasn't mentioned, but tell him if we tried to include all the good ones it would take six pages.

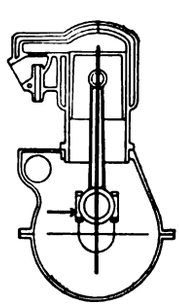
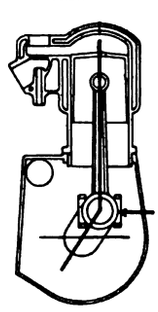
Model Forty-Four, 34 H. P. $2250.



Spare Wheel, with inflated tire, brackets and tools, $74.
Magneto $150.

THE OFFSET CRANK SHAFT



Most automobiles develop sufficient power when they are traveling at a *high* speed. The greatest need is for power at *slow* engine speeds. Rambler Model Forty-Four can be operated smoothly and steadily at *three* miles an hour on *high* gear. This is because of the offset crank shaft.

Rambler

The Car with the Offset Crank Shaft

How the Offset Crank Shaft is an Advantage

Ordinary Engine. Position of piston at explosion center. **Explosion exerts no turning effort to crank shaft. The dead center wastes energy. Shock falls on bearings.**

Rambler offset crank shaft. Position of piston at explosion center. **Full power of explosion exerts turning effort to crank shaft. Dead center eliminated. No energy wasted. No shock to bearings.**

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, November 19, 1908. No. 8

EXPLOITING POPP'S TAXIMETER

American Business and Patents Bought from French Owners—How the Probable Profits are Figured.

To exploit the Richard Popp taximeter in the United States and Canada, a company capitalized at $1,500,000 has been launched, under the title the Franco-American Taximeter Co., with headquarters at 112-114 West Forty-second street, New York City. Francoin Ducasse has been chosen president. Practically all of the English and French directors of the company are in New York at the present time, conferring with the American directors.

The rights and titles to the American and Canadian patents have been transferred to the new company by the Societe Generale des Compteurs des Voitures, of Paris, which owned the patents for all countries. The French company has already developed considerable business on this side of the water with cab companies and individuals, and such contracts as it has for the rental of the machines, together with the instruments themselves, are turned over with the patent rights. In payment the Franco American company has agreed to give the French company half of its common stock and $100,000 in cash.

The capital of the concern consists of 25,000 shares of 7 per cent. preferred participating stock, of the par value of $20, and 50,000 common shares at $20 par. It is planned to manufacture 10,000 taximeters which will be rented at an average of $60 per year and the average expense of which will be $20 per year, giving an estimated net profit of $400,000.

Haynes Doubles Its Capital.

Control of the Haynes Automobile Co., of Kokomo, Ind., has been placed in the hands of a stock voting trusteeship for five years, accompanying a reorganization of the company by which its capital stock has been raised from $300,000 to $600,000. With the increase of capital a number of Kokomo investors have taken shares, while in the past the majority of the stock has been owned in Portland, Ind. The trustees selected include H. C. Davis and Richard Ruddell, of Kokomo, and C. C. Cartwright of Portland.

Satterlee Denies Plans for Merger.

Further agitation and rumor concerning the alleged combine of the Maxwell-Briscoe, Olds and Buick interests have brought forth a denial from Herbert L. Satterlee, a son-in-law of J. Pierpont Morgan, and who has been credited with being the prime mover in the negotiations. When asked concerning the probabilities of an immediate combine, he said: "The report is absolutely untrue. I can state positively that the concerns mentioned do not contemplate figuring in any such deal."

Rainier Factory Will Continue.

Jesse Watson, the receiver for the Rainier Motor Co., of New York City and Saginaw, Mich., announces that in spite of the receivership the factory at Saginaw will continue in operation. The 1909 models will be put on the market as originally intended.

Henry Goes with Inter-State.

David W. Henry has become sales manager of the new Inter-State Motor Car Co., of Muncie, Ind. The company's cars, which will be known as the "Inter-State," will be ready about the first of the year.

Syracuse Aluminum Plant Burns.

The Syracuse Aluminum & Bronze Co.'s plant, at Syracuse, N. Y., was visited by a disastrous fire on Tuesday, 17th inst. The conflagration resulted in an almost total destruction of the buildings.

Crescent Removing to Goshen.

The Crescent Motor Car Co., of Detroit, Mich., has decided to remove to Goshen, Ind., and the transfer is now under way. The Cosmo soap plant has been taken.

POPE HEARING PROVES A QUIZZ

Objecting Stockholder's Attorney Puts Receiver Through Long Cross-Examination—Discrepancies Explained.

Apparently alone in his opposition to the reorganization plans for the Pope Mfg. Co., nevertheless Thomas H. O'Connor, of Jersey City, holder of 100 shares of the preferred stock, did not recede from his position, at the special hearing before Vice-Chancellor Howell, at Newark, N. J., on Monday, 16th inst. In support of his contention that the offer of $1,500,000 for the assets of the company is "grossly inadequate," and that the receivers should not be given permission to accept it, his attorney put Receiver Albert L. Pope through a long ordeal of cross examination, in an endeavor to establish discrepancies between the latter's present estimates of the values of the various properties and the appraisal made last May. In his examination, O'Connor's attorney, Willard C. Fiske, pointed out that the appraisers' valuation of the assets was $2,600,000, while the receivers now regard the committee's offer as a liberal one, and declare the total value of the assets to be only about $1,250,000.

In explanation, Receiver Pope took up the items one by one, and also gave an account of the payments that have been made on claims since the first appraisal was rendered, and which have resulted in a corresponding reduction in the assets. He also showed that a difference in estimate occurs when the assets are regarded as "in liquidation" or as those of a "going concern."

As one of the three receivers for the company, the witness testified that it would be difficult to get $500,000 net for the Hartford plant "in liquidation," while $200,000 would be an outside price for the Westfield (Mass.) plant at a forced sale. The company's Thompsonville plant he appraised at $10,000, with the explanation that the company had tried to sell it for five years,

Digitized by Google

without getting a bid for it. The estimate, he said, was a fair one.

The Hagerstown (Md.) plant, Receiver Pope went on to tell, would eventually net about $125,000, inclusive of the $57,500 already paid for the factory premises, "if the reorganization scheme should carry." Otherwise, $75,000 would be the outside amount that could be realized. The Pope Mfg. Co.'s claim against the Pope Motor Car Co., the witness estimated, is worth $350,000 at the outside. The stock of the latter company, which is all owned by the Pope Mfg. Co., he said would bring nothing.

Two plants of the Federal Mfg. Co., whose stock is all owned by the Pope company, the receiver estimated might net $50,000. One, at Elyria, O., he explained, has already been sold for $35,000 cash, and the other, at Cleveland, was worth as much. From the aggregate sum of $70,000, he deducted the sum of $19,000, a claim for that sum being in litigation in the Ohio courts.

When the enumeration was completed Attorney Lindabury said: "These several valuations total about $1,250,000. Is it your opinion that $1,500,000 is a fair offer for the Pope company's assets?"

"Yes, sir," the witness answered, with emphasis.

Attorney Fisk, in the course of a long cross-examination, quizzed Receiver Pope about appraisals reported by the receivers at divers times, which were seemingly at variance with the valuations as stated by him on the stand. The witness explained that since the appraisals cited by Fisk were made, $379,000 had been taken out of the assets to pay a third dividend of 25 per cent. to creditors, while $80,000 had been paid in settlement of the Unzicker claim.

Fisk called the witness's attention to a statement in the published plan of the reorganization committee, to the effect that the committee expected to realize enough from the Pope plants, outside of the Hartford and Westfield plants, which the new company would operate, to pay off the $800,000 in notes which it was intended to issue, and asked him how he could reconcile such a statement with the valuations he had just put on the properties involved.

To this the receiver answered that the committee's statement was made in May last, and that since then one property, that of the Columbia Steel Mills, had been sold for $180,000, and the proceeds used in the payment of dividends to creditors, while $250,000 had been taken from assets in the Maryland jurisdiction and used in the same way. The assets, aside from those in Hartford and Westfield, would now no longer suffice to meet the proposed issue of $800,000 of secured notes, and earnings would have to be used to eke out.

In his argument, Fisk pointed out that creditors of the Pope company were not interested, the only ones concerned being the stockholders, and he urged that it was the duty of the court to protect the interests of stockholders, whether great or small. He contended that the Pope company's various plants were worth much more than the price offered, and that to permit the sale would be in effect a summary condemnation of his client's holdings in the concern.

The creditors, however, took a hand in the hearing, and Percy S. Bryant, of Hartford, Conn., counsel for the creditors' committee, urged that the court give permission for immediate acceptance of the offer. "We want to get our money," he said. Although he was present, neither O'Connor nor any witness for his side was put on the stand. Colonel George Pope and Frederick C. Billings, one of the appraisers, were present to testify for the receivers.

No decision was announced by the court after the hearing. It was indicated, however, that a final decision would probably be made in a few days.

Death of George A. Burnham.

George A. Burnham, general factory manager of Morgan & Wright, of Detroit, Mich., was instantly killed last Saturday, 14th inst., while duck hunting on Baltimore bay, near Pearl Beach, Mich. Standing in a skiff after firing one barrel of his gun, Mr. Burnham attempted to lay the weapon back of him in the bottom of the boat. In doing this he held it by the barrel, and the stock of the gun, instead of going into the boat as he had intended, went over the side, where the trigger caught and discharged the second barrel. The entire charge lodged in the back of his head. Although accompanied to the bay by three other officials of the Morgan & Wright factory, none of them was within hailing distance at the time of the accident, the only witness being a young man who was punting the skiff.

Except for one year's service in the Spanish-American war, Mr. Burnham had been with Morgan & Wright continuously since 1893, when he first obtained employment in the bicycle tire department. He advanced rapidly, becoming superintendent, and later factory manager. When the factory removed from Chicago to Detroit, a large part of the planning of the arrangements for the immense new plant devolved upon Mr. Burnham, a work which he accomplished with signal success. He was recognized as an expert and authority on tires, and personally was as affable and companionable as he was able and unassuming. Mr. Burnham was born in Portland, Me., October 1, 1874, and his early youth was spent in Boston. In Detroit he was prominent in automobile circles, and as a member of both the Knights Templar and the Mystic Shrine had a wide acquaintanceship and prominence. He leaves a wife and three children.

Brandt Becomes a Rambler Manager.

Ernest H. Brandt has resigned as general manager of the Detroit-Cadillac Motor Car Co., of New York City, to accept the management of the eastern distributing depot of Thomas B. Jeffery & Co., of Kenosha, Wis. He will have charge of Rambler territory in Virginia, Maryland, Delaware, New Jersey, Pennsylvania east of Altoona, eastern New York State and western Connecticut, making his headquarters in the Rambler building, 38 West Sixty-second street, New York City. Upon the purchase of the Detroit-Cadillac Co. by Inglis M. Uppercu, recently, Brandt was elected secretary and general manager, so that he might continue along the same lines as when he was the manager under the Cadillac Motor Car Co.'s ownership of the concern. The Rambler offer, however, presenting a larger field, induced him to make the change, while preserving pleasant relations all around. He will take about half a dozen members of his former organization with him in the new work.

The Week's Incorporations.

Detroit, Mich.—Ford Motor Co., under Michigan laws. Increase of capital from $150,000 to $2,000,000.

New York City, N. Y.—United States Motor-Cab Co., under New York laws, with $50,000 capital. Corporators—G. Duell, M. Sussman and T. J. Bell.

Newark, N. J.—Cope Co., The, under New Jersey laws, with $50,000 capital; to manufacture automobiles and carriages. Corporators—M. M. Dodd, G. G. Conley and A. Church.

Waterbury, Conn.—W. B. S. Automobile Co., The, under Connecticut laws, with $50,000 capital, $1,000 subscribed. Corporators—Charles S. Woodward, Ira F. Bachelder and Henry Stackman.

New York City, N. Y.—Cameron Motor Co., under New York laws, with $150,000 capital. Corporators—Ernest Stauffer, Jr., Arthur F. Gotthold and Harold B. Elger, 2 Wall street, New York.

Philadelphia, Pa.—Travelers' Garage and Auto Co., under Delaware laws, with $25,000 capital. Corporators—C. R. Calhoun, Philadelphia; G. W. Smith, Jr., Germantown,; J. D. Calhoun, Omar.

New York City, N. Y.—Steam Motor Co., under New York laws, with $25,000 capital. Corporators—John Magee Ellsworth, Henry C. Cryder and Theodore A. Havemeyer, 583 Park avenue, New York City.

Washington, D. C.—Electric Speedometer and Dynamometer Mfg. Co., The, under Delaware laws, with $500,000 capital. Corporators—C. E. Munroe, W. M. Kimball, N. M. Hopkins, K. Woods, C. M. Remey and W. T. Bingham.

New York City, N. Y.—Kayton Taxicar and Garage Co., under New York laws, with $100,000 capital; to manufacture and deal in automobiles. Corporators—E. M. Leventritt, J. F. Jacobs, W. F. Tracy, F. G. Braun and C. J. Heermance.

GRANTS REBATES ON PARA RUBBER

Bill to Lower Export Duty for Brazilian Syndicates—Foreigners File Protests Against Preferences.

Para rubber trade will undergo a violent readjustment if a recent legislative act of the Para state legislature affecting the exportation of this product is signed by the governor. The new law, which has passed the local chamber of deputies, provides for a rebate of 4 per cent. of the 22 per cent. export duty, to Brazilian syndicates founded under the law of 1903 and recognized by the state government, on fine and medium grade rubber exported abroad directly by such syndicates. The rebate would be made on the basis of weekly averages. Its effect would be to give the Brazilian syndicates a monopoly on the exportation. The foreign houses established in Para could not operate in competition with them, because of having to pay the higher export duty. Strong protests have been presented through the State department at Washington to the Brazilian Federal Government, against this action on the part of one of its states, and the British and Portuguese houses engaged in the trade are also stirring their respective governments to similar representations. The annual export of Para rubber amounts to over 38,000 tons, or almost $60,000,000.

Turns Over Selden Royalty Excess.

Among the chief October disbursements of the receivers of the Electric Vehicle Co., of Hartford, Conn., according to the reports filed for the month, was the turning over of $76,580.41 to the Association of Licensed Automobile Manufacturers, representing Selden patent royalties in excess of the $150,000 per annum maximum which the company is allowed to keep under the terms of the new agreement with the association and its members. Of the $150,000 which it retains, a maximum of $60,000 per year goes to George B. Selden, and the balance of $90,000 to the company itself, this amount having been recently set aside by the court's order for the benefit of the creditors as the company's share in the royalties for the past year.

The receivers' report for October discloses an increased factory activity, the purchases amounting to $23,208.37 as against $9,371.54 in September, and the pay roll being $24,780.12 as against $17,262.67 in the previous month. The balance on hand November 1 was $175,834.28, as against $208,188.46 on the first of October.

Freight Concessions in the South.

Important freight concessions have been obtained from the Southern Classification Committee by the traffic department of the National Association of Automobile Manufacturers, representing also the Association of Licensed Automobile Manufacturers and the American Motor Car Manufacturers Association. A lowering of rates in the Southern States south of the Ohio and east of the Mississippi has been effected, and the concessions also in some instances reduce the through rates to points in the South from points in the Central Freight Association's territory, lying between Buffalo and Chicago, and rates from points east of Buffalo on shipments routed via southern despatch lines.

New Location for Philadelphia Show.

Instead of holding Philadelphia's show in the First Regiment armory as on the past two occasions, the Second Regiment armory has been chosen, being a much larger building, located at Broad and Susquehanna avenue. The event will take place from January 27 to February 3, inclusive, and will be under the management of J. H. Beck, who has managed former shows.

Cleveland Postpones Its Show Dates.

Cleveland's automobile show has been postponed a week from the date originally set. The time now selected is the week of February 22, at the Central armory. The management will not be in the same hands as formerly, having been given to a committee of the Cleveland dealers.

Albany Concern in Receivership.

The Albany Automobile Co., which for a time undertook to manufacture cars in Albany, Ind., has gone into a receiver's hands. The proceedings are before the U. S. Circuit court in Muncie, Ind., where Judge Leffler has appointed the Muncie Trust Co. to act as the receiver.

Goshen Gets a Rubber Company.

The Goshen Rubber & Tire Co. has been organized by Dayton (O.) capitalists. The plant will be located in Goshen, Ind., and is expected to be in operation by the first of the year. It will include the old buildings of the Goshen Rubber Co.

Rider-Lewis to Move to Anderson.

The Rider-Lewis Motor Co., of Muncie, has made arrangements to move to Anderson, Ind., on the first of the year. A new factory in the latter city is being hurried to completion by that time.

Changes Name to Rome-Turney.

The Long-Turney Mfg. Co., of Rome, N. Y., which makes radiators and automobile specialties, has changed its name. It will hereafter be known as the Rome-Turney Radiator Co.

Gilbreath Goes with Oakland.

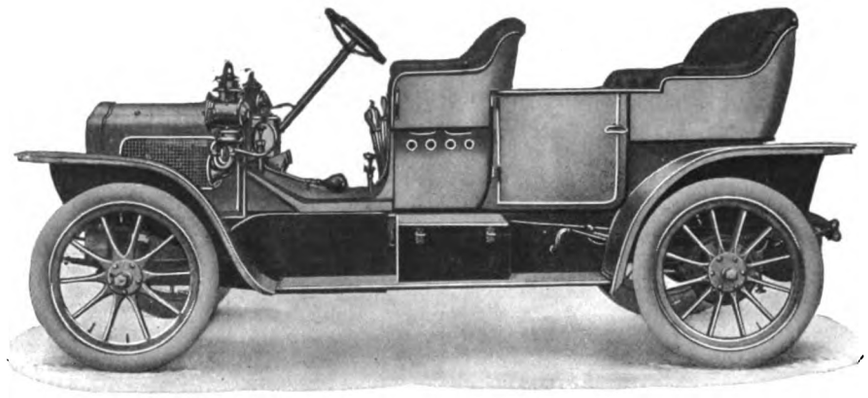
W. S. Gilbreath has severed his connection with the Waverley Co., of Indianapolis, Ind. He is now with the Overland Automobile Co., in the same city.

TO DROP THE 1909 PARIS SALON

French Makers Signing an Agreement not to Exhibit—Heavy Bond Forfeitures for Violation.

Having tired of the burden and expense of annual shows, the French makers, according to advices from Paris, are signing a general agreement, the effect of which will be to abolish the Paris Salon for the year 1909. The agreement provides that the makers subscribing to it shall not exhibit at any motor show which may be given in Paris during the coming year, under penalty of a forfeiture of 50,000 francs. The signatures of practically all the larger makers —those making over 100 chassis per year— are said to have been obtained already, and the circular will be presented to the smaller makers, as well.

The object to be accomplished is not the complete extinction of the Paris show, but to bring an interval of at least two years between the forthcoming event and the one to follow it, after which the shows may be held biennially, annually or not at all, as conditions may suggest. The fact that a year's time no longer develops changes or improvements of any very striking character in the French models has lead to the belief that the time has come when a show once in two years would be sufficient, being of more interest by reason of the greater length in the intervening period and presenting an economy to the chief participants in such affairs.



Last year the subject of biennial shows had considerable agitation, but was not carried to the point of concurrence which it now receives. The agreement which is being circulated does not affect the 1908 Salon, except that the makers are being urged to do their utmost to make the this year's show a success because of the prospect of its being the last for two years. If it be deficient in interest or returns, however, the exhibitors will be the more ready to turn to the biennial plan, which now enjoys every likelihood of adoption.

Shawmut Factory is Destroyed.

Fire consumed the factory of the Shawmut Motor Co., of Stoneham, Mass., on the 13th inst., causing a loss estimated at $100,000, of which the Shawmut company's share is given as $75,000. The company carried $42,000 insurance. The plant, a three-story wood structure, located at Kidd and Pine streets, was seen to be in flames shortly after midnight, and burned so rapidly that the efforts of the firemen were unavailing. Frequent explosions of small quantities of gasolene endangered their work. Several finished cars and some in process of construction were destroyed, together with much valuable machinery.

A WHITE STEAMER FOR $2000!

Not since 1904 have we made a car priced at so low a figure as $2,000. The White—"the car in a class by itself"—has thus been brought within the range of a larger number of purchasers than has been the case in recent years.

The new $2,000 White car, known as our Model "O," has none of the attributes of the "cheap machine." It is simply a "smaller edition" of our $4,000 car. The new model "O" is rated at 20 steam horsepower, which means that it can do the work of gasoline cars rated at much higher figures. The wheel-base is 104 inches; the tires, both front and rear, are 32x3½ inches. The car is regularly fitted with a straight-line five-passenger body. The frame is of heat-treated pressed steel. The front axle is a one-piece forging of I-beam cross section.

The nature of the steam engine is such that the engine of small power has all the desirable attributes of the engine of high power. In other words, as the weights of our small car and of our large car are proportionate to the power of their respective engines, the small car can do anything that our large car can do.

To summarize the features of our new Model "O" car—it is noiseless, odorless, smokeless and absolutely free from vibration. All speeds from zero to maximum are obtained by throttle control alone. The speed of the car responds instantly to the throttle; the engine can never be stalled. The directions for driving are summed up in the phrase, "Just open the throttle and steer." It starts from the seat—"no cranking." It is the ideal moderate priced machine. It is the best for the man who wishes to drive and take care of his own car. It is a result of our nine years of experience in building the White Steam Car—the only machine which finds a ready market in every portion of the globe.

Write for circular giving full details of this car.

NEW YORK, NOVEMBER 19, 1908.

The Rise in Rubber and Its Effects.

Unexpected developments in the crude rubber market have brought about a condition which, taken in conjunction with other industrial conditions have wrought no little disquietude among the tire makers. In fact it has become recognized pretty generally throughout the trade that a combination of high prices, a reputed shortage in the crop and a strong demand on this and allied markets are so endangering the future of the tire industry as to render the advisability of long continuing the present listings a matter of grave question. Indeed after investigating present conditions, the Motor World has no hesitancy in predicting that barring unforeseen contingencies the present prices for automobile tires will be abandoned by the first of next January and a new and higher scale adopted, thus reversing the movement of last August when a general cut in prices was agreed upon by a number of the makers.

That the effect of increasing prices demanded for crude rubber already has been felt abroad is evidenced by the fact not generally known, that two of the largest foreign makers have announced a 10 per cent. increase in price within a few days. In America, following a year of general curtailment in all lines, rubber manufacturers are universally short of stock. With prices for the raw material at low water mark and the market well supplied, they have been buying conservatively and in many instances producing only sufficient finished material to supply the current demand. With the closing in of fall, however, a sharp and continued rise in price has set in, the visible supply has dwindled, and as a final blow it has become impossible to contract for deliveries after the first of the new year.

The present low prices were based upon the conditions existing last summer when the rubber market was in an unusually favorable condition. The prospect of a heavy demand, the general resumption of business in all lines, together with the fact that the upriver fine Para rubber was then selling at 89 to 90 cents a pound as against $1.08 and $1.22—the minimum quotations for August markets in 1907 and 1906, respectively—tempted the makers to reduce their own quotations to a uniform extent.

With the last of September, however, prices had risen toward the figures of 1907, the last of October saw them at $1.03 and $1.04 as against $0.99 and $1.00 a year ago, and reports of the Brazilian market published this week give an authenticated maximum of $1.30, with unconfirmed reports of trading at $1.32, still referring to the upriver grade of fine Para. Other grades have followed the trend in descending scale. Local buying is in moderate amounts only among both dealers and manufacturers.

Foreign markets also are reported as feeling the pressure, and in at least one instance, the "American demand" was mentioned as exerting a strong influence in boosting the prices. That the market may soar to $1.40 by the first of January is far from improbable.

At the same time, other lines of rubber manufacture are beginning to evidence recuperative tendencies with the improvement of business conditions following election, this also tending to increase the agitation, while in the tire market itself the outlook for a prosperous season for the automobile industry tends to encourage plans for production on an increased scale. For the most part the automobile manufacturers are pretty well covered by contracts made at current prices. The increased demand of the early spring induced by the general refitting of cars in the hands of private owners therefore, is the contingency against which the tire makers are now anxious to provide.

About "Going into Politics."

According to one of the New York "auto editors," who, like Senator Frelinghuysen, and so very many other alleged Jerseymen, earns his livelihood in New York, all sorts of things are likely to happen to the New Jersey Automobile and Motor Club for the part it played in the defeat of Senator Colby in the recent election; disruption and the formation of a rival club are among the several dreadful things that are likely to occur.

Because Mr. Colby stands for the New Idea—for a higher order of politics than that practised by the wardheeler and grafter his defeat may be somewhat regrettable, but because of his very high-mindedness and reputation for intelligence and righteousness, the automobilists were justified in expecting not a narrow view, but a square deal at his hands. When he failed to give evidence to this end, he courted opposition and as he received what he courted, he should have small fault to find with his defeat. It was high time that the automobile conscience of New Jersey was quickened. The manner in which the legislature has assumed a stand-and-deliver attitude and picked the pockets of all who use automobiles in the state, is not short of disgraceful.

The New Jersey club performed a much needed public service in directing attention to the fashion in which $14 is extracted from the pocket of even the non-resident who enters the state but once, and to other iniquities of the Frelinghuysen law. It is bad enough for a resident to be compelled to pay for the supposed right to use the public highways, but it is infinitely worse when one state in the union undertakes to issue "passports" and exact what is practically an admission fee from the residents of all other states in the Union, and requires that they shall stop on demand that their "passports" may be examined. It is contrary to the American notion of republican institution and republican government. It is directly opposed to the American notion of a union of states. It is legislation of the narrow-minded and offensive sort.

As Mr. Colby stands for that sort of government it was right and proper that his

Digitized by Google

victims and their friends should turn on him. It is to be hoped that they will turn on the Colbys and the Frelinghuysens wherever they may exist. Apparently it is the only way that the victims ever will be able to obtain a square deal. "Going into politics" was the only way the cyclists nearly a quarter century ago obtained their full measure of legislative fair play. They obtained exactly the same freedom accorded other road users and the automobilists should not remain content with less. All they need to do is "knock out" a few more Colbys and a Frelinghuysen or two, and to upset the results at a few precincts or wards in an occasional state. They now are strong enough to do it and it should be done. The news will spread fast enough. Politicians do not squeal unless they are hurt. The squeal from the Colby camp is evidence that the automobilists' work was effective. the fear that Colby may seek revenge in legislative halls which has depressed some timorous souls, need cause no great concern if the men with backbones who led the New Jersey fight let it be known that any attempt of the sort will visit on the parties to it the same sort of treatment accorded Mr. Colby.

As for the New York-New Jersey "auto editor," who is anybody's press agent, his efforts to stir up strife in the New Jersey automobile club well may be discounted. He possesses a small commission from the state and is anxious to hold it. If he really desires to turn the light on anything he might turn a few rays on the late New York-Montauk efficiency run, in which he himself had such a large hand, as according to some accounts, the real reasons why the participants were lodged on an uncomfortable boat when a comfortable hotel was available, will make unusually interesting reading.

Electricity for Car Lighting.

Considering the amount of attention which has been paid to the subject of car lighting, it is somewhat to be wondered at that no more effort has been made to introduce electricity for this purpose. As applied to electric vehicle useage it has proved the unquestionable servicability of incandescent lamps for this purpose when properly made and installed—this being the chief point in doubt as to the general practicability of the system. The only other question, that of its relative expense and ease of maintenance, remains to be solved. But its solution must depend in part on the relative convenience of the three possible systems quite as much as upon their first cost or upon other factors which are involved. For limousine cars the use of interior electric lighting is almost universal. To a limited extent it also is applied in machines of this type to tail-light and dashboard work. Its extension to the field of pleasure cars should be by no means the difficult and unproductive task it may appear.

The continued vogue of the acetylene searchlight has led to so many abuses that its use in cities is now pretty generally frowned upon by considerate motorists. Yet no form of tempered light has been advanced to take its place, so that a majority of the machines in night use about the great cities, are driven with only the insufficient service of the oil dash lamps. These for the most part, serve only the purpose of warning signals, and have no practical value in illuminating the road in front of the machine, which, though it may not be necessary for ordinary city work, yet is an advantage when traversing poorly lighted streets, or when running during stormy weather. The powerful acetylene lights, despite their advantage for work in the open country, are ill-suited to driving under such conditions and at times constitute a source of positive danger, both to pedestrians and drivers of other vehicles, because of the confusion wrought by their blinding glare. Systems of shading these lights, or deflecting their beams have been devised, but for some unaccountable reason have failed to come into general use.

The electric light has the marked advantage over other systems that it requires no trimming, always is ready for use, and gives a soft glow which, by properly proportioning the size of the lamp to the requirements, may be as strong or as mild as may be desired. It is as certain in a high wind, or when the car is being tossed about on a rough road as when it is standing in the garage, is free from all taint of fire risk, discharges no combustible oils or gases in the event of accident, and may be lighted at will without taking the driver out of his seat.

Apparently those most intimately concerned with it are not aware of the real immensity of the automobile industry. Its magnitude just has been made plain by a concern which makes a specialty of selling "representative mail lists," of the various trades to those who are not wholly free from guile. Among many others, it has for sale lists of 819 "auto manufacturers and assemblers," 347 manufacturers of "autos driven by gasolene," 70 "electric automobile manufacturers," 31 "automobile buggy manufacturers," and 69 "auto lamp manufacturers."

If the Society of Automobile Engineers desires to be accepted seriously and not merely as a medium for personal exploitation, it might risk something more than an eye on the advertisements of the gentleman who is serving as its president. Perhaps he is not using his office for personal benefit and means no harm in attaching his official title to the advertising of his business, but it is such an unusual procedure as to give rise to varied impressions.

Whenever a milkman breaks one of his bottles, he is quite apt to throw the broken pieces out on the pavement. Automobile clubs in various cities are awakening to the fact and it is probable that this class of offenders will be given special attention in the near future.

COMING EVENTS

November 25, Savannah, Ga.—Automobile Club of America's 200 miles light car race.

November 26, Baltimore, Md.—Automobile Club of Maryland's hill climb, Belvidere avenue hill.

November 26, Savannah, Ga.—Automobile Club of America's 400 miles race.

November 27, Denver, Col.—Colorado Industrial Exposition Association's race meet. Overland Park track.

December 5, Long Island Motor Parkway—Speed trials against time, auspices of the Long Island Motor Parkway, Inc.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

ART FEATURES FOR PALACE SHOW

Early English Decorative Scheme Adapted to Demand of Exhibitors for Space—Aerial "Extras" Crowded Out.

So great has been the demand for space at the Grand Central Palace show, which opens in New York on New Year's eve, that the exhibits of balloons, aeroplanes, gliders and other aeronautical contrivances which have been an "extra" in the past, will be crowded out entirely to make room for the regular exhibitors. Of the latter there are 75 car makers and about 250 accessory makers, making an aggregation which is claimed to be "by far the largest numbers of exhibitors ever congregated under one roof at an automobile show."

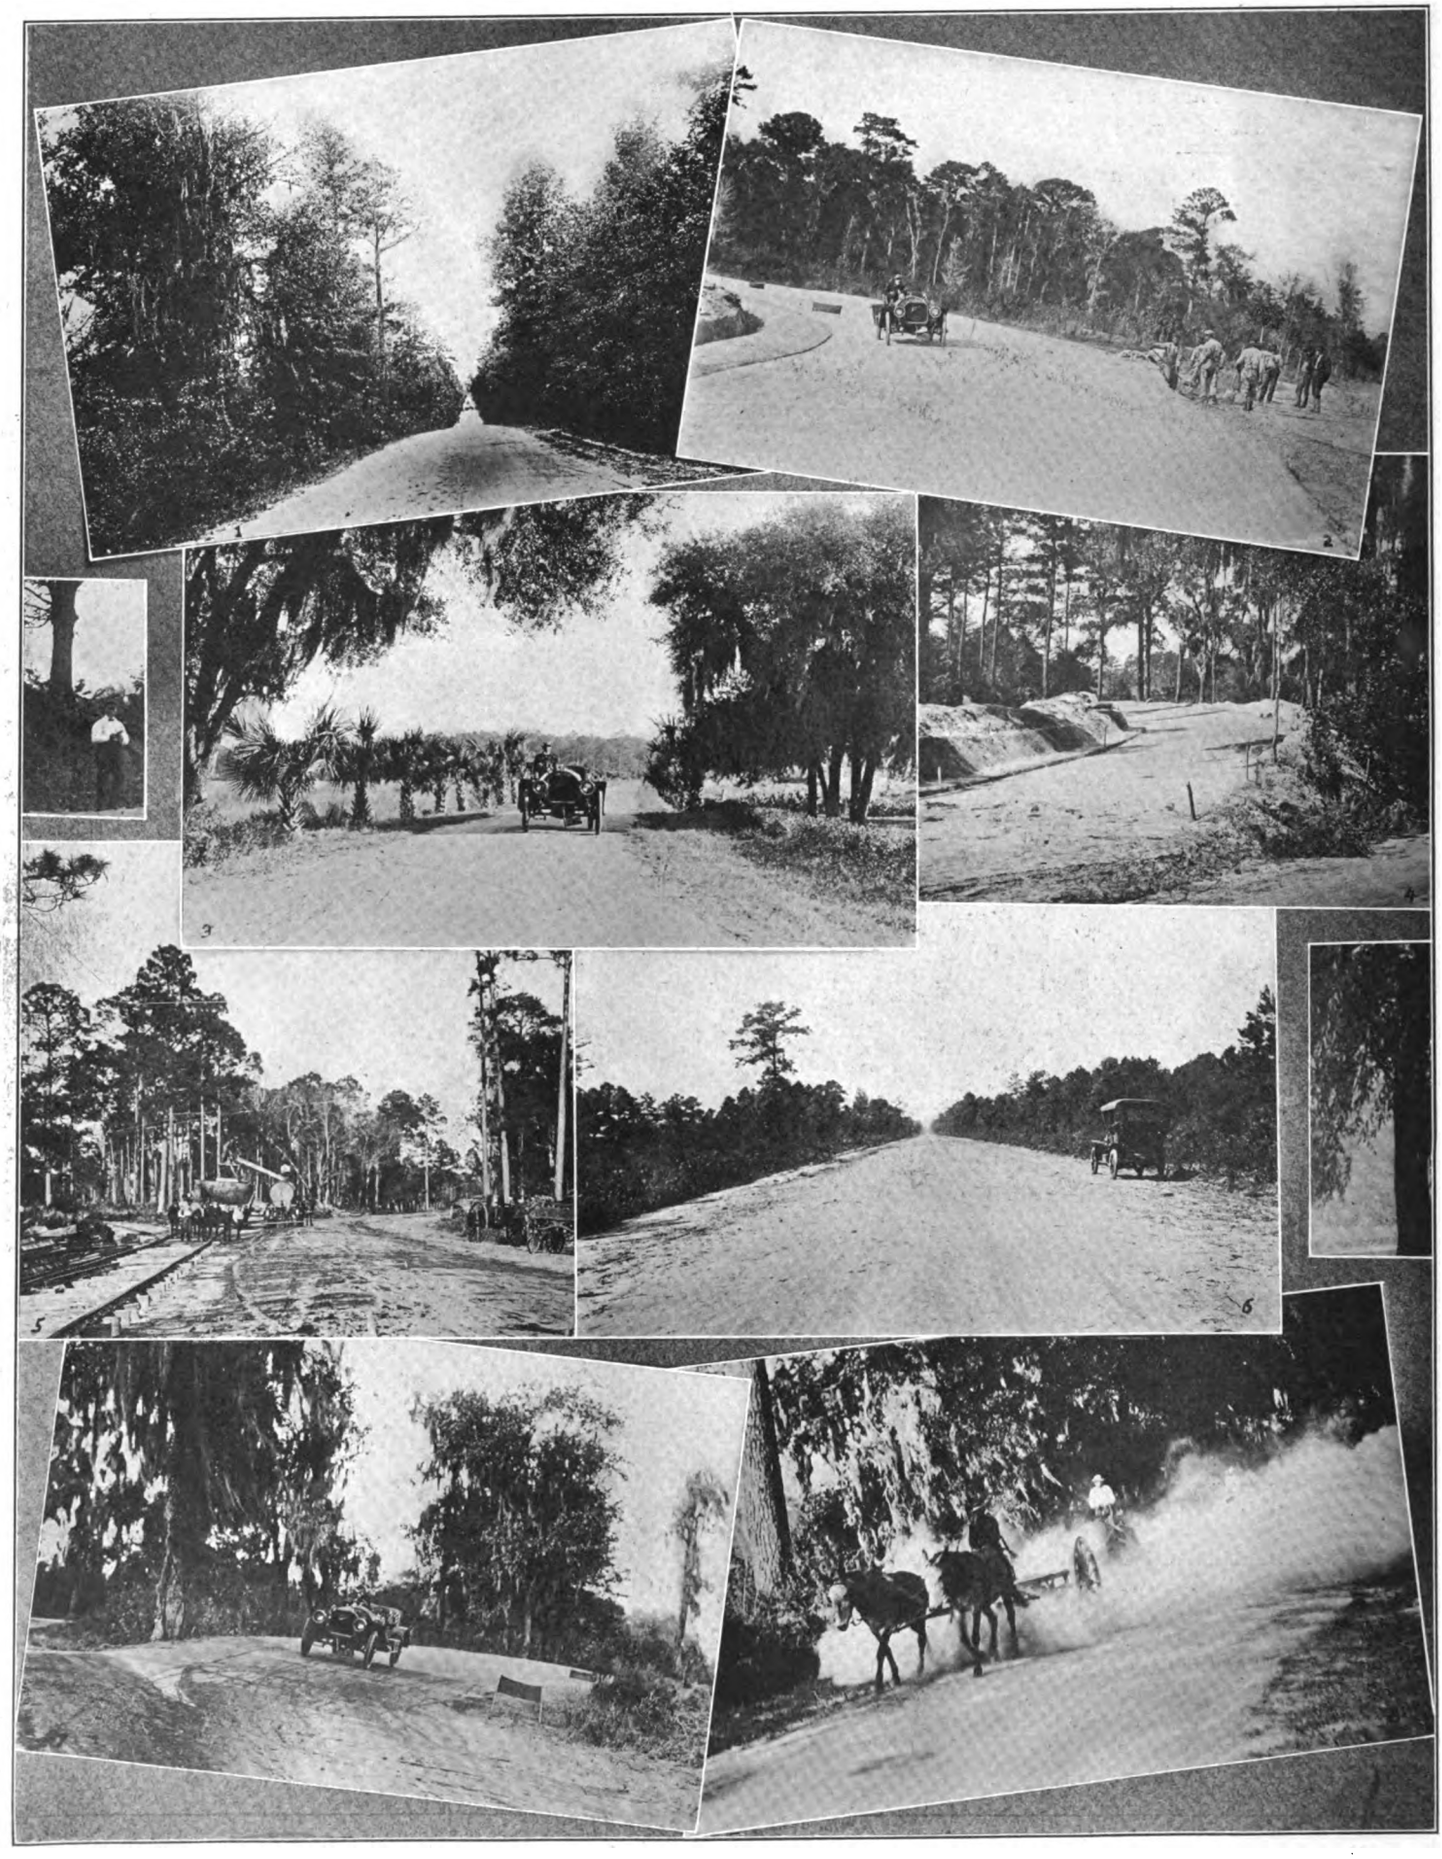
Even the decorations have had to yield to the necessary economy in space, and while sacrificing nothing in artistic beauty, will be on the "sheath gown" order of slimness as far as possible, so that no bulky masses or protuberances will encroach on the area available for the space holders. The work on the decorations is progressing to a point where everything is available for the purpose. As indicated by the illustration presented herewith, they will form a suitable setting for the affair without obtruding on the vital displays of the exhibition.

EARLY ENGLISH SETTING FOR THE "GREAT WHITE SHOW."

Demonstrations of cars will remain as one of the features of the Palace show, it being the belief of the American Motor Car Manufacturers Association that dealers and buyers still find them a valuable aid in determining the running qualities of a car and in judging the advantages of the various control systems. When the question of abolishing demonstrations was presented to the show committee, the representations as to their value and desirability were so strong as to insure their continuance.

In accordance with the policy of giving the affair "tone," the catalog which is to be issued in connection with it will be kept free of advertising. The catalog will contain a complete list of the evhibitors, together with a directory of their spaces and a summary of their products, being in the nature of a handsome souvenir and record of the occasion.

The difficulties of the show committee in providing space for all those desirous of obtaining allotments have been very great, indeed, and have made it necessary to use every nook and corner of the building. "It has been a case of trying to make two feet grow where one grew before," according to H. O. Smith, chairman of the committee. The fact that the exhibits include not only cars of American manufacture, but a number of the famous foreign cars as well, has swelled the aggregate of displays in this class, and the growth in the number of taxicab models which the makers are desirous of displaying has made the taxicab division one of considerable magnitude and importance. Furthermore, the accessory makers have increased in numbers, with no diminution in their respective lines, so that their requirements for room in which to stage their devices to good effect have become greater than in the past.



Double Date for Engineers' Meeting.

As is customary, the Society of Automobile Engineers will hold its annual meeting in New York City during the show season. In order to accommodate its various members who are likely to be in attendance at one or the other of the two shows, however, it has been decided to adopt a dual date. The opening sessions will be held beginning Tuesday, January 5, and adjourning to Tuesday, January 19, one of the two gatherings thus falling into each of the two show weeks. In addition to the usual technical program the fourth annual business meeting and election of officers will be held.

Newark Dealers Determine on Show.

Despite a refusal from the Motor and Accessory Manufacturers, Inc., to grant a sanction for their proposed show, the automobile dealers of Newark, N. J., have taken courage again and plan to hold the affair anyway. It is thought that the accessory lines handled by the dealers themselves can be displayed advantageously without the manufacturers' assistance.

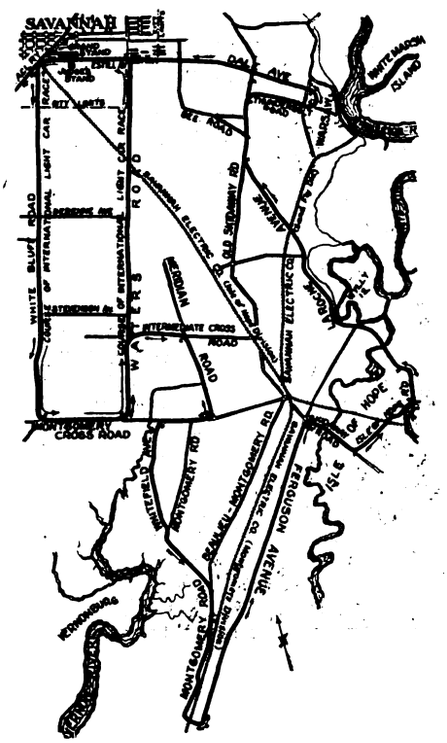
SHAPING UP FOR THE GRAND PRIZE

Turns and Stretches of Savannah Course—Drivers Draw Positions—Preparations for Handling Mighty Crowd.



With the Savannah meet but one week off, arrangements are going forward on a large scale to make it a success, and with every prospect that from the competitive point of view at least, it will carry a fulfilment of all the hopes which have been held out for it. Originally conceived by the Automobile Club of America as a foil for the Vanderbilt Cup contest, when that event was ruthlessly shorn of its international character and promoted savagely during the heat of the now forgotten controversy with the American Automobile Association, the peaceful settlement of that difficulty has secured for the Grand Prize race of Thanksgiving Day and the introductory light car race of the day before, recognition which it could have obtained in no other way and practically secured its patronage by such of the northern enthusiasts as care to sever the home ties on the great national home day.

Last April when Savannah saw its first road race, the course was in splendid shape, with the exception that it was narrow in stretches, with one or two rough spots. Inasmuch as $30,000 or more has been spent to widen and bank the circuit and that it will be made as nearly dustless as possible by thousands of gallons of oil, with which it has been soaked, it can be considered without the least hesitancy the finest road course in America, and can rank with the best of European circuits. The Grand Prize course measures 25.13 miles, which will mean that 16 laps over it will make the race 402.08 miles in length. The shorter circuit, or "course within a course," for the light car race, is 9.8 miles around, and will be traveled for 20 laps, or 196 miles.

The setting of the race is highly picturesque. Bordered with the tall pine trees characteristic of the section, which are bearded with great quantities of silver gray Spanish moss, a series of vistas are presented that delight the eye, as the course is toured at moderate speed.

From the grandstand which is within the city limits of Savannah, a well banked turn leads into an absolutely straight stretch some five miles long, known as the White Bluff road. At Montgomery cross roads the route turns into Waters road, and presently is headed back in the direction of the stand. At the end of a short stretch, an abrupt, heavily banked turn to the right is the continuation of the Grand Prize course, while straight ahead is the ten miles quadrilateral which will be used for the light car race. This leads directly back to a right angle turn near the start and finish, over a new laid piece of road.

Following the longer course, the Intermediate cross road leads into Meridian road at a second right turn, and the Vernon River, with its semi-tropical vegetation surrounding it, is approached. Then a third right turn, abruptly made, furnishes a complete reversal of direction momentarily until a right-angled left turn leads into Whitefield avenue and the Montgomery road, where the new part of the course is encountered—60 feet wide and smooth as a billiard table. Two well constructed turns, forming practically a hairpin, lead into Ferguson avenue, where the return journey to

the starting point begins. This section will permit some of the greatest speed of the race when throttles may be thrown wide open and held until a capital "S" turn through the aptly named Skidway road to Isle of Hope road, where six turns, all of which are heavily banked, lead into La Roche avenue. A turn to the right, leading towards the village of Wasson, gives a second hairpin loop back to Delaware avenue, which completes the course back to the grandstand by easy stretches.

Some of the picturesque points on the course are shown on the opposite page, the two upper pictures showing stretches of both ordinary and special road; the latter being the banked turn where the intermediate cross-road turns into Meridian avenue at the county farm, with convict laborers at work. The third panel gives an idea of the stumpy palmettos and the enormous spreading trees along the new stretch of La Roche avenue, while No. 4 shows where a special bank 6 feet high is intended to eliminate the skidding danger. Ferguson avenue has just been oiled, the fifth and sixth panels showing its uniformity. Sixty-two feet wide, and with less than a foot grade, it presents the speediest stretch of the whole course. The two bottom pictures are views of Montgomery cross road where it switches into Whitefield avenue, and the White Bluff road with the final brushing of the surface in progress preparatory to oiling.

Regular practice by the prospective competitors began last Monday, and the course is patrolled daily by 100 flagmen, who keep it clear of invading traffic between the hours of noon and 4 p. m. Between 12 and 1 o'clock, the light cars have the use of the course, while during the remainder of the alloted practice hours it is at the disposal of the drivers of the larger machines.

On Monday of this week, the drawing of numbers for the order of starting in both races took place, there being 20 contestants in the Grand Prize, 6 of whom are Americans, while the light car race numbers 17 contenders. The complete list is as follows:

Grand Prize.

	Driver.	Car.	Country.
1.	Rigal	Bayard-Clement	France
2.	Michener	Lozier	America
3.	Seymour	Simplex	America
4.	Burman	Buick	America
5.	Haupt	Chadwick	America
6.	Nazzaro	Fiat	Italy
7.	Zengle	Acme	America
8.	Hemery	Benz	Germany
9.	Duray	De Dietrich	France
10.	Szisz	Renault	France
11.	Harding	National	America
12.	Cagno	Itala	Italy
13.	Hautvaust	Bayard-Clement	France
14.	Wagner	Fiat	Italy
15.	Hanriot	Benz	Germany
16.	Strang	Renault	France
17.	Fournier	Itala	Italy
18.	De Palma	Fiat	Italy
19.	Erle	Benz	Germany
20.	Piacenza	Itala	Italy

Light Car Race.

	Driver.	Car.
1.	J. Juhasz	S. P. O.
2.	Wm. Hilliard	Lancia
3.	L. G. Bergdoll	Chalmers-Detroit
4.	K. I. Manville	American Aristocrat
5.	F. T. Cameron	Cameron
6.	.....	Isotta
7.	Geo Robertson	Gregoire
8.	Robert Burman	Buick
9.	Arthur See	Maxwell
10.	L. B. Lorimer	Chalmers-Detroit
11.	E. A. Hearne	Buick
12.	Thomas Costello	Maxwell
13.	W. R. Burns	Chalmers-Detroit
14.	Hugh Easter	Buick
15.	Joseph Muntweiler	Maxwell
16.	Earl Jeffers	Buick
17.	C. W. Kelsey	Maxwell

In the big race, Leonard Zengle has been substituted for Patschke as the Acme driver, while the driver of the Isotta in the light race has not been decided upon; Herbert Lytle, who was scheduled to pilot it, having been taken ill with typhoid fever.

Announcement was made late last week that the A. C. A. had decided to award the winner of the light car race a $500 bronze or silver trophy made after one of several designs which the contest committee then had under advisement. This dispelled some

Digitized by Google

anxiety which had been manifest lest the winner of this event fail to receive some token of recognition comparable with that awarded the winner of the Grand Prize. In addition to the major trophies, ample inducements are held out to the successful drivers by tire and accessory makers.

Prizes to the extent of $5,000 have been offered by the Michelin Tire Co. for drivers gaining places with that make of tires in the Grand Prize and light car races. In the long race, the winning driver will be awarded $2,000, the second $1,000, third $500, fourth $300, and fifth $200. Prizes in the light car contest for placed drivers using Michelins will be $500 to the winner, $300 to the second, and $200 to the third. The Continental Caoutchouc Co. offers $2,000 to the winner of the Grand Prize, provided his car is equipped with Continentals; with $1,250 and $750 as second and third prizes. In the light car race $500 will be distributed under the same conditions—$250 to the winner, $150 to the second, and $100 for the third. Likewise the Bosch Magneto Co. has offered ample inducements to drivers who carry a Bosch equipment; $500, $250 and $100, are the bonuses offered for first second and third.

Arrangements for the management of the race are probably as complete as have been made for any race ever held in this country. It will be remembered that one distinguishing feature of the stock car race of last spring was the excellency of the policing arrangements. Savannah intends to outdo itself in this respect just now. Complete telephone service, military guards, strict observance of rules as to the maintenance of a clear course, will serve to give the competitors every advantage in the race and also to enable the spectators at the grandstand in keep in close touch with the progress of the events.

A novel feature of the arrangements is the establishment of fire patrol stations at four different points on the course. These stations will have telephone communication with all parts of the course, and be in readiness to send out an automobile equipped with extinguishers, in case a car should catch fire, repeating the incidents of the last Vanderbilt contest.

Twenty or more physicians will be stationed around the course, with fully equipped red cross tents, prepared for any emergency. Arrangements also will be made for a staff of motorcycle couriers.

Arrangements for the accommodation of the visitors have been carried out with equal elaboration. In anticipation of a throng of out-of-town spectators, hotels, lodging houses and private dwellings have been canvassed and listed, and all Savannah is preparing to reap a harvest from the occasion. At that, many of the sojourners will bivouac in the numerous special trains which will be sidetracked "near the grandstand," or, in the case of the A. C. A. delegation, on board the specially chartered steamer, City of Savannah.

A number of railroad and tourist agencies have arranged special excursions to the race and have cut each other's rates ruthlessly in an effort to get the southbound business. In consequence, either one of two things will happen; an amazing number of people will go to witness the race, or else numerous "all expenses covered" and "parlor car special" tours will be financial losses to the agents who are advertising them so profusely. The Pennsylvania, Atlantic Coast, Seaboard Air and other lines will run excursions, while these roads will carry numerous car parties from various cities booked by the tourist agencies. Several large automoblie clubs will send representatives, the Cleveland and Quaker City Motor Clubs being among the number with chartered cars. The "Wall Street Special" and "Business Men's Special," starting from New York City, expect to carry quite a crowd of persons whose business affairs demand that they make a quick trip, in which connection it is promised the latter train will make the jump to Savannah in an even 22 hours.

The Savannah line will provide a pleasant means of making the trip by water, while the Automobile Club of America's chartered steamer will start on Saturday evening, November 21, with perhaps the most elaborate scheme of entertainment of all.

VISTA OF LONG STRAIGHT STRETCH ON LA ROCHE AVENUE

Stricker Killed at Birmingham.

While attempting to make a new 24 hours track record at Birmingham, Ala., on Tuesday, 17th inst., Emil Stricker was thrown from his Renault mount and died shortly afterward. Leon Barrows, his mechanician, was also thrown and badly injured. Stricker had been driving at a rate close to a mile a minute on the mile oval and was alternating with Lewis Strang at the wheel. Strang's explanation of the accident is that when the car skidded on a turn, Stricker's long coat caught in the rear wheel,, pulling him from the seat. Tire failure was not the direct cause, as at first reported, he states. Stricker was a native of Alsace-Lorraine, unmarried, and when in New York lived at the Professional Chauffeurs' Club.

LOCOMOBILE RECEIVES THE CUP

Festivities Attend Presentation of Vanderbilt Trophy—President Davis Tells the Origin of the Winning Car.

Enthusiasm ran high when the formal presentation of the Vanderbilt Cup was made to Samuel T. Davis, Jr., president of the Locomobile company, at the home of the Automobile Club of America, Broadway and Fifty-fourth street, New York City, on Thursday evening last, 12th inst. Before a gathering of some 300 or more invited guests, Jefferson De Mont Thompson, chairman of the Vanderbilt Cup Commission, presented the trophy on behalf of the donor, William K. Vanderbilt, Jr., accompanied by loud, ringing applause.

"We have waited for five years," he remarked, "for an American car to win this prize that now stands as the one great automobile trophy. We have the car now—American from top to bottom, designed by an American and driven by an American. We have had much to be proud of this year, but nothing more so than this."

In his response, Mr. Davis gave a most interesting chapter of Locomobile history in describing the origin of the car. In 1904, he said, a young Chicago enthusiast, (Dr. Julian P. Thomas, of aeronautic and medicinal fame), who owned a whole fleet of Locomobiles, wanted the Bridgeport company to build him a racer that would beat the world. When the company demurred, the man declared he would have another manufacturer build the car and buy no more Locomobiles. "The customer was too good to lose," continued Mr. Davis. "and he was so insistent that we finally decided to place a prohibitive price on a car we did not want to build. We named $18,000, and he accepted without a murmur, and deposited $6,000 forthwith. Then we had to make good, and we did build a machine for him.

"That first Locomobile didn't beat the world. In fact, it only started in one big race—the Gordon Bennett Cup. It started—that was all it did do. Nevertheless, from that first effort, developed the winner of this year's Vanderbilt race. In 1906 we constructed two racers and the recent winner was one of them."

He then expressed his appreciation of A. L. Riker, the designer, the mechanics who constructed and assembled the car, and last, but not least, George Robertson, who piloted the car to victory, and his mechanician, Glenn Ethridge; mentioning that without a driver of superior caliber, success would be impossible with the best car ever built.

After Riker had said a few modest words, there were loud shouts of "Robertson!" for the gathering wanted a speech from the driver. But while the shouting was at its height, Winthrop E. Scarritt sprang to his feet, and began to deliver his stock speech, harking back as far as the days of the Roman empire and also declaring boldly that the automobile is no longer an experiment—that it has come to stay, and furthermore, that his prophecy of some time ago to the effect that American genius and American brains in building American cars, would some day beat the world, had been fulfilled Again the guests yelled for the winning driver, but again Mr. Scarritt arose; this time to introduce John J. Hayes, winner of the Marathon race at the Olympic games in England.

Hayes received a thunderous ovation, but the Robertson speech that had been anticipated, was not delivered. The modest driver had been "snowed under" by the others.

Ex-Police Commissioner McAdoo delivered an absorbing address on the question of police and motorists, with numerous brilliant touches of humor. Incidentally he made the disconcerting statement that automobilists and the Burglars' Union were on the same par—both bodies forever trying to dodge the police. Also he told why he had inaugurated the scheme of having cycle police wear white caps. At that time people used to observe with a smile that no arrests would be made, because a driver could "spot" a cop a mile away and would slow down; to which the commissioner invariably would reply that that was exactly what he expected. He was not trying to make a record of arrests; he was attempting to make motorists drive at a safe speed. Nine out of every ten accidents in New York City are caused by the failure of drivers to observe and obey the rules of the road, McAdoo declared, incidentally scoring the habitual recklessness of the average taxicab driver. That corners are turned too sharply and in a dangerous manner by many drivers is evidenced by the way so many curbs are worn down at street crossings.

Evidently the peaceful incidents of the past few weeks have resulted in the arrangement of a truce between Jefferson De Mont Thompson and Robert Lee Morrell. That the hatchet has been buried, at least temporarily, was made clear when the chairman of the commission, in a burst of geniality and enthusiasm, proposed three cheers for one who was "unable to be present, a true sportsman—Robert Lee Morrell." With waving arms, Thompson led the cheering in person. Others, absent ones and those who were not, also were lustily acclaimed, but in the exuberance of the moment no one remembered to honor the Cup donor, and about the only name familiar in connection with the contest which was not cheered was that of William K. Vanderbilt, Jr.

A. R. Pardington, vice-president and general manager of the Long Island Motor Parkway, Inc., when called upon, recapitulated the history of the early Vanderbilt Cup contests and stated with no little pride that work on the Motor Parkway would proceed, so that next year would see its completion. Judge E. H. Gary, president of the A. C. A., was another to say a few cordial words. Then entertainment of the combustible variety was distributed, a searchlight photograph was taken following which an Ethiopian singer in a loud pink Prince Albert coat, entertained briefly. Then came the moving pictures.

Results of St. Louis Hill Climb.

After several days of worry and delay, the judges of the hill climbing contest held at St. Louis on Friday, 6th inst., at last reached a decision regarding the winners of the various events. Emulating the example of the Algonquin and other slope tests, the committee of the St. Louis Automobile Manufacturers and Dealers Association in charge of the affair, took the advice of some one who told them that the contest should be decided according to a piston area formula. This was done, but it seems that after the times of the contestants had been duly recorded, the judges did not know just how to plunge into the mathematical part of the game to determine the winners.

They decided that Baldwin, who drove the specially built Stanley steamer, was entitled to the Times trophy and the free-for-all prize cup. Following is the report of the percentages officially given out, showing the order of positions awarded in each class as determined by the formula:

Motor Buggy Class.

Driver.	Car.	Time.	Per Cent.
Allen	Eureka	2:12	10.82
Oliver	Victor	1:53	11.05
Siddway	Success	2:11	19.30

Cars with Piston Area Under 50 Sq. In.

Paine	Chal-Detroit	1:05⅗	5.92
McQuillan	Buick	1:04⅘	6.90
Delaney	Jackson	1:21⅗	8.41

Cars with Piston Area Over 50 Sq. In., and Under 65 Sq. In.

McLain	Apperson	1:00⅗	6.05
Igoe	Moon	1:03	6.85

Cars with Piston Area Over 65 Sq. In., and Under 90 Sq. In.

Tuttle	Stod-Dayton	0:49	6.19
Blumcoe	Stev-Duryea	0:55⅕	7.62
Lewis	Packard	0:54⅘	7.88

Cars with Piston Area Over 90 Sq. In.

Soules	Stearns (4-cyl.)	0:46⅗	7.42
McLain	Apperson	0:44⅗	8.03
Caldwell	Pierce	0:49⅗	8.75
Oldfield	Stearns "6"	0:49⅗	9.00

Free-for-all Event.

		Time.
Baldwin	Stanley	0:40⅘
Baldwin	Stanley	0:43⅕
Woodward	Stanley	0:45
McLain	Apperson	0:46⅗
Cull	Stanley	0:46⅗
Tuttle	Stoddard-Dayton	0:49
Oldfield	Stearns	0:49⅗
Caldwell	Pierce	0:49⅘
Woodward	Stanley	0:55

FENNER FIRST IN DESERT RACE

Los Angeles-Phoenix Run a Real Test of Endurance—All Four Contenders Survive—Their Exciting Adventures.

One of the most strenuous and unusual contests that ever took place in the West was the "great desert race and sand battle" between Los Angeles, Cal., and Phoenix, Ariz., which started at midnight on Sunday, 8th inst., and finished the following Tuesday. It was won by F. C. Fenner, who drove his White steamer "Black Bess," with H. D. Ryus as alternate, covering the 455 miles in 30 hours 28 minutes net running time. Leon T. Shettler's Kisselkar, driven by Bert Latham and H. Hanshue, was the second contestant to reach the goal, but second prize was awarded to A. J. Smith, who was the third arrival in an Elmore, owing to a time allowance made for delay caused in crossing the Colorado River on a raft. The latter pilot was the only contestant to drive the entire race without relief at the wheel, and covered the distance in 32 hours, 52 minutes actual running time. The Kisselkar was given third place with 35 hours 52 minutes, and Ralph Hamlin's Franklin was fourth. In addition to some side wagers, Fenner won the Republican cup which was offered by a Phoenix newspaper as first prize. This was presented to the driver at a dinner tendered by the Maricopa Automobile Association at Phoenix the following Thursday. Smith was also presented with a silver cup.

The race possessed unusual interest, inasmuch as there were as many distinct types of power plant in use as cars. Gasolene cars of two cycle and four cycle patterns; water-cooled and air-cooled, and one steam car made up the field of contenders. Such a variety in a contest of only four competitors was quite unusual.

From the very start, the contest was most trying. The route led through El Monte and San Bernandino, to Beaumont, where the first stage of desert driving through sand and loose pebbles commenced. Pulling through Palm Springs, Indio, Mecca, and a few other spots on the map, the contestants reached Dos Palmos, 170 miles from the start, where the first checker was located. Hamlin in the Franklin was in the lead up to this point, having gotten that far in 8 hours 61 minutes, with Ryus in the steamer, second in 9 hours 43 minutes, Latham third and Smith fourth.

From Dos Palmas to the Colorado River, the worst part of the trip was encountered. Latham and Hamlin experienced tire trouble and the former had a strained rear axle. At Ehrensburg, where the stream had to be crossed, it was swollen by early melting snows and had to be negotiated on a rather uncertain raft propelled by a quartet of drunken Indians, who had no great desire to work very hard. They managed to get the several contestants into Arizona in separate trips at $8 per trip. Time consumed in crossing this "felly" was noted by appointed observers and later deducted. Just before reaching the ferry all of the contestants strayed from the road and got lost in an irrigation ditch, losing hours in retracing their way.. When Hamlin, the Franklin driver got astray in the pitchy darkness, he decided not to attempt to retrace his steps, but slept until dawn, when daylight helped him to get his bearings. When he at last found his way back to the Los Angeles-Phoenix trail, after losing four precious hours, he hastened on, but in the mean time, the other contestants had secured a lead too big for him to cut down. Fenner and Smith had both halted on the Arizona border after a risky trip across the turbulent river and spent an almost sleepless and uncomfortable night beside a roaring campfire, finally starting on at dawn. Fenner had experienced trouble shortly after leaving Dos Palmas. At that point sand clogged his engine and prevented him from getting up any steam at all. His burners simply got red hot without having the desired effect of making the necessary steam. Two pipes of the car which lay one upon another were melted, and a delay of an hour was occasioned in making a repair.

In order to secure better traction, Smith, who drove the Elmore, rigged a plank on the rear of his car, upon which he made his mechanician sit and it was said to have worked like a charm, from the driver's standpoint, though the mechanic had a different view of the matter.

From Ehrensburg it was a long plug over many miles of sand and rocks, through Quartsite and Salome, until Buckeye was reached miles beyond,where a guide led the way and marked the trail into Phoenix.

Hamlin's "Greyhound" Wins at Phoenix.

Following the desert race from Los Angeles, Cal., to Phoenix, Ariz., the Maricopa Automobile Association held a track meet at the latter city on Wednesday, 10th inst., in connection with the Territorial fair. This was the first track meet Phoenix had ever witnessed and several thousand persons attended. The "feature" event of the day, which was a 10 miles brush open to the four contestants who had driven in the desert race, was disappointing, inasmuch as only two of these started, Hamlin in the Franklin "Greyhound," and Latham in the Kisselkar. A Reo was entered to help fill out. Hamlin, who won the long endurance run of the previous two days, got the Greyhound working well and succeeded in ripping off ten miles in 10:41, and winning the event from Latham.

In a ten miles match between a Buick and a Tourist car, Fremeau, handling the latter, easily disposed of his opponent, lapping him before the finish.

DISQUALIFIED FOR USING DOPE

Denver Endurance Award Altered Because of Ether in Swanbrough's Fuel—Colburn Gets the Prize.

As a result of an ill-advised effort to win the economy test promoted by the Denver Motor Club on November 7th by means of fuel which had been "doctored," E. W. Swanbrough, who was first announced as the winner, was later disqualified and set down at the foot of the list of the 18 survivors. As told in last week's Motor World, Swanbrough, driving a Corbin car, covered the prescribed distance of 112 miles from Denver to Greeley and return, on 2½ gallons of gasolene. This was in accordance with the original report of the contest committee, which awarded both the Ralph W. Smith cup and the Denver Motor Club cup to Swanbrough. On the following day, however, a protest was filed by the Colburn Automobile Co., which had entered a car, charging that Swanbrough's gasolene had been tampered with. The protest was allowed and upon chemical analysis, fuel in the tank of the disputed car was found to have been etherized. The original award was promptly nullified and the dishonest driver was notified that in the future he will be barred from competitions held under the club's auspices.

Inasmuch as the Colburn car was credited with the best percentage, aside from that of the disqualified car, (4.89), the Smith cup was awarded to D. B. Colburn, who drove it. This percentage was determined by formula, taking into consideration the weight of the car with passengers and the weight of gasolene consumed. The club's prize, which was for the least consumption of gasolene, regardless of weight or percentage, was awarded to F. W. Alkire's Ford, this car having consumed 16½ pounds of gasolene, or slightly more than 2½ gallons. In the percentage showing, D. L. Moody's Pope-Hartford was second with a score of 4.817, and George A. Markwell's Stevens-Duryea was third with a score of 4.812.

New Course for Los Angeles Hill Climb.

Instead of making use of the old Box Springs course for the annual Thanksgiving Day hill climb at Los Angeles, the Automobile Dealers Association of Southern California has selected a new slope for this season's contest. The projected route is through open country and does away with the dangers encountered heretofore on the public thoroughfare, where the crowds have been too great for safety. No curves or turns are to be found on the hill to be used in the contests to be held on the 26th and the average grade is about 12 per cent.

THE INDUCTOR TYPE OF MAGNETO

Daring Example of Reversed Arrangement of Elementary Organs—Remarkable Simplicity of the Ford Device.

So rapid has been the development of the high tension type of magneto during the past two or three years that it is difficult for the layman to keep fully posted on the points of finer theory which underlie it. One of the more recent systems to come into use is sometimes known as the inductor type, in which the arrangement of the elementary organs is practically a reversal of that familiar in the more common instruments of its class. This system is best understood if it be considered as equivalent, electrically speaking, to an ordinary magneto in which the armature is held stationary and the magnet caused to rotate around it. By this means the use of rotating coils and in fact all rotating conductors except such as are necessary to the distribution of the current are dispensed with. An unusually daring and attractive example of the type in question is that embodied in the construction of the new Model "T" Ford cars, and developed in connection with the design of that vehicle.

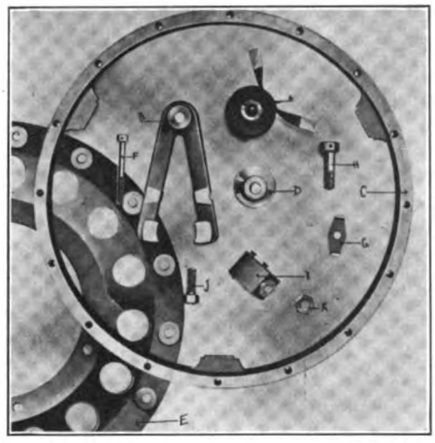

Fig. 2

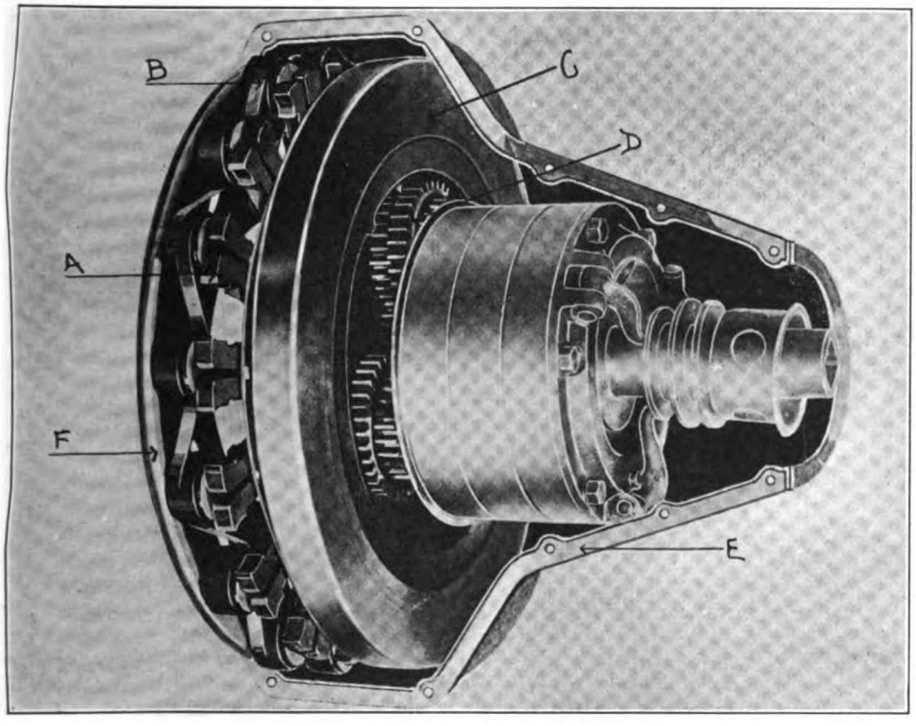

Fig. 1

As already told in connection with the description of the complete car recently published in these columns, the magneto is incorporated directly in the fly wheel and power plant housing construction, where it is not only protected from the invasion of destructive foreign bodies, but also is most effectually concealed. The portion of the device, B, Fig. 1, corresponding to the armature of the usual form of magneto, is mounted in a fixed position and positively attached to the housing, E-F, which extends from the crank case of the motor to include the change gear group, D, in the unit plant arrangement. The moving part, A, which corresponds in its electrical purpose to the magnet of the more common pattern, is incorporated into the fly wheel itself, C, and by virtue of its own weight makes possible the lightening of the fly wheel without reducing the equalizing effect upon the motor in the slightest degree.

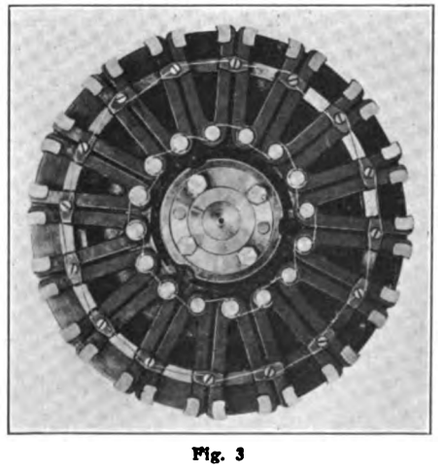

Fig. 3

The components of the magneto, shown in Fig. 2, are seen to be of the simplest possible description. The stator, or stationary part comprises a spider attached to the main housing and mounting a series of small coils, A, which are connected in series. Whenever the fly wheel turns, current is generated in these coils, and so throughout the ignition system, by the passage across the ends of the coils of a series of small magnets, B, which are mounted on the fly wheel by means of the ring, C, and the various locking devices, shown in detail. The magnets are connected in such a way as to form the necessary "magnetic circuit," thus corresponding to the complete magnetic enclosure of the armature in the ordinary form of magneto.

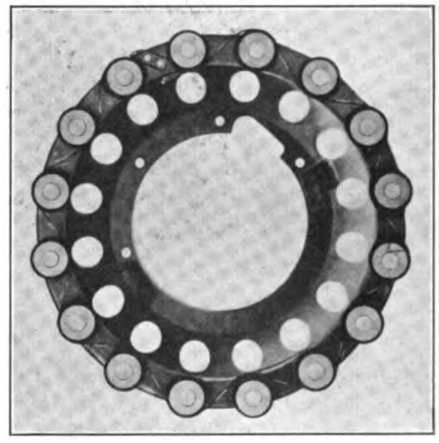

Fig. 4

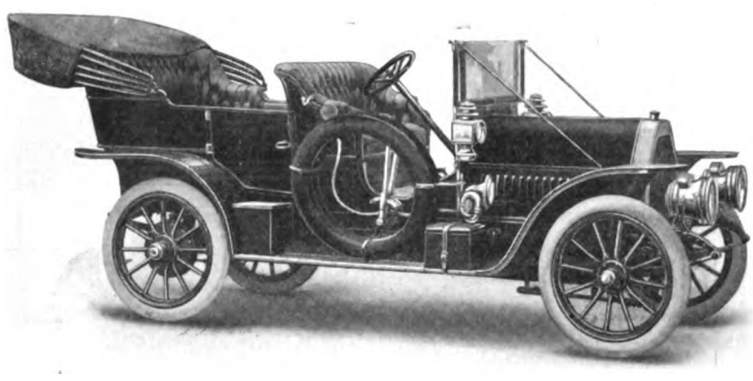
A better idea of the arrangement may be obtained from Fig. 3, which shows the rotor or inductor complete and mounted on the fly wheel. The view is from the forward end of the part and clearly indicates the relative position of the poles themselves which pass directly over the windings of the stator. This is shown in Fig. 4, ready to be attached to the casing.



Aside from the advantages derived from the compactness of the arrangement and its protected position, a number of other considerations point to its excellence. Thus the absence of moving gearing of any sort, the elimination of the commutator, as well as of the moving wires, brushes and contacts, constitute features which are of the greatest value from the standpoints of simplicity and economy. Unlike the conventional forms it offers no temptation to the inexperienced tinker and is little likely to suffer from this source.

NEW JEWEL MODEL ANNOUNCED

Seven Passenger Touring Car the Latest Addition to the Line—Special Details of Design and Equipment.

Originally interested in the production of a peculiarly effective type of light runabout which possessed a number of unique and original features, the attention of the Forest City Motor Car Co., Massillon. O., later was turned to the evolution of a larger car known specifically as Model "G." Early last summer a very attractive addition to this took the form of the Model "40" roadster, a still later and newly announced

JEWEL MODEL "40" TOURING CAR

supplement to which is the Jewel "40" touring car, possessing many of the features of the roadster model, but mounting a seven-passenger body of most acceptable delineation, though exhibiting no striking departures from the routine of current practice. Mechanically, the car reveals these specific points: a 4¾ by 5 inch Rutenber motor of the four-cylinder, vertical pattern; self-contained system of lubrication with constant level pump enclosed in the crank case; double ignition as a regular equipment, including the Bosch high-tension magneto, Connecticut spark coil and Exide accumulators. This equipment is complete to a duplicate set of plugs, either series of which may be brought into action by means of a switch which is conveniently located on the toe board. The transmission is of the propeller shaft type, with three-speed change gear of the selective order, and full floating axle.

The front axle is a single piece drop forging of I-beam section. The front wheels are mounted on Timken roller bearings, as are the steerings knuckles. The rear axle, and transmission mounting also is of the same pattern. The wheel base is 120 inches and the wheels are 36 inches in diameter, shod with 4 inch tires in front and 4½ inch in the rear. The complete vehicle, with equipment, weighs 3.000 pounds, or thereabouts.

From the accompanying picture of the car may be seen its unusually roomy character—a feature which is brought about at once by the employment of the long wheel base, and by placing the rear seat well back of the rear axle. By this means ample foot room is secured, as well as plenty of tonneau space for the extra seating required to bring the capacity up to requirement, while it also serves the happy purpose of allowing ample entrance to the tonneau without crowding the front seat toward the dash. It will be observed that the design of the hood, though arranged to afford ample motor space is not such as to be obtrusive.

An unusually broad equipment is included with the machine, including as it does, the full lighting installation, with 9-inch searchlights, and gas tank; double tire irons and trunk rack in addition to the tool outfit. In the way of an option, choice is offered the purchaser of no less than four distinct makes of tire.

One-Piece Screw Driver, All Steel.

Among the chief features of the new "all steel" screw drivers which are being produced by the Billings & Spencer Co., of Hartford, Conn., is the fact that they are one-piece products, including the handle. Each one is a drop forging, and the handle,

instead of having wooden side pieces, as erroneously stated in a previous description, consists of four longitudinal flanges from the shank itself, as shown in the illustration, affording a grip that is peculiarly firm and powerful in the hand. The new form of screw driver is supplied in eleven sizes.

Machinery for Assembling Wheels.

Assembling automobile wheels entirely by machinery has become possible through the exploitation by an Ohio company of a newly invented system designed for that purpose. Being entirely automatic it makes possible a considerable increase over the ordinary rate of production.

AUBURN ANNOUNCES NEW MODEL

Neat Condensation of Touring Car Lines in Vehicle of Moderate Proportions—Its Double Opposed Motor.

After seven years of unostentatious concentration on the production of a car of moderate power and price the Auburn Automobile Co., Auburn, Ind., has developed a machine which in many respects presents features of peculiar merit in the enormous field to which it is designed to cater. Although one of the numerous products of the middle west which are unfamiliar to many outside their own immediate vicinity, it is well worthy of study, since in simplicity of construction it represents a continuance of a number of excellent features of the light runabout of former popularity in common with the "set-up" and general characteristics of the more elaborate high powered product.

In general appearance it presents a rather neat condensation of the conventional touring car lines, the seats being of ample size, comfortably arranged and so spaced as to afford ample foot room. The bonnet is of the "continental" type with large radiator in front affording no less than 143 square feet of cooling surface, and the mechanism is enclosed beneath by a protecting boot.

The power plant comprises a double opposed motor of 24 horsepower rating, and with cylinder measurements of 5¼ by 5 inches. Transmission is by center chain—a system of meritorious simplicity—with a two-speed, planetary change gear in which the high speed relation is secured by means of a multiple disc clutch. Braking is done through the rear wheel hubs, and the mechanism of control involves a simple arrangement of pedals together with a single side lever.

The frame is of pressed steel, the spring semi and full elliptical, front and rear, and of five and seven leaf construction, respectively, while the axle mounting is entirely anti-friction consisting of Hyatt roller bearings in the live rear member, and ball mountings in front. The major specifications are: wheel base, 100 inches; tread, 56 inches; and tires, 32 by 3½ inches, equipped with detachable rims.

Soap as Lubricator for Clutches.

Lubrication of clutches of the plate or multiple disc type is ordinarily supposed to be best accomplished by the use of a special grade of oil such as recommended by the makers of the car only after reliable and presumably exhaustive tests. A foreign authority, however, is responsible for the statement that "two tablespoonfuls of soft-soap dissolved thoroughly in half a pint of boiling water is better than any oil, and prevents glazing."

GUARDING AGAINST FREEZE-UPS

Simple Methods of Adapting the Cooling Mixture to Weather Conditions—Uses of Alcohol and Glycerine.

It almost invariably happens that the first cold snap of the fall finds some innocent motorists unprepared for the inevitable and results in the shelving of their cars while repairs necessitated by the freeze-up are being carried out. Such accidents are all the more disgusting because they not only deprive the owners of the use of the machines at a season of the year when they offer the most alluring inducements to recreation seekers, but also because they are as needless as they are provoking and expensive. Several years ago the Motor World published an account of a series of very careful experiments to determine the most suitable precautions looking toward the prevention of freezing, as a result of which it was concluded that wood alcohol and glycerine mixed with water in certain proportions varying with the temperature conditions to be met would serve to best advantage. Although numerous preperations designed specifically for the prevention of freezing have been put on the market since that time, it is significant that the use of these simple commodities remains unquestioned in its value.

A bulletin recently issued by the Association of Licensed Automobile Manufacturers gives confirmation of the principles involved and practically reviews the steps by which original conclusions were reached. Based on the results of the early tests the recommendations given may be depended upon as being perfectly trustworthy.

"Wood alcohol was chosen for the first experiment," relates the bulletin referred to, "because there was not the slightest chance of it injuring any machine. A set of laboratory freezing experiments were made to determine what percentages of water and alcohol would freeze under artificial conditions. The results showed that it is possible to use alcohol and water mixed to resist almost any degree of cold.

"Then the question of whether alcohol would separate from the water and waste away so fast as to make the expense prohibitive, was taken up. It was felt that considerable alcohol might be lost on mild days. A water-cooled automobile was taken and seven gallons of water-alcohol mixture, 18 per cent. alcohol, put in the cooling system. By connecting to the top of the radiator a bottle, into which a pipe led from above the water level, it was found that except under extreme conditions, such as on a mild day, allowing the engine to run without a fan while the machine was standing still, no vapor at all arose.

"This led to the thought that it might be possible to close the cooling system entirely in cold weather, obviating any chance of loss by boiling away. A pressure gauge connected to a cooling system so closed, indicated a pressure of only six pounds under very severe conditions.

"It is also possible that many machines that have relief tubes can be run with a closed system. The safest way to find this out in an inexpensive manner is to take a small bit of rubber tubing, fitting the end of the blow-off pipe, put a wooden plug in one end of the tube and slip the other end over the pipe lightly. Any pressure that could injure the machine at all would blow the tubing off and prevent injury.

"When the temperature was as low as 15 degrees Fahrenheit below zero, a mixture of water and alcohol—33 per cent alcohol—resisted freezing perfectly, even when the car was left outdoors all night. With the temperature around 50 or 60 degrees Fahrenheit, this mixture will boil slightly.

"It is not probable that the temperature will drop below 10 degrees above zero before the first of December; in which case 15 per cent. of alcohol in the mixture is enough. As the season progresses and zero temperatures are likely, nothing less than 25 per cent. of alcohol is safe.

"The combined use of glycerine and alcohol mixed with water solves the question for both hot days and cold days; the boiling point of glycerine, being higher than that of water, will balance the low boiling point of alcohol, so that the boiling point of the mixture will be reasonably high. As the percentage of glycerine required to meet a given temperature is much larger than the required percentage of alcohol, and as a matter probably of comparative cost, a mixture of alcohol and glycerine for use in the water is better, although glycerine slowly but surely destroys rubber tubing connections. A mixture of water and glycerine—30 per cent. glycerine—will freeze at about 15 degrees Fahrenheit. To be safe at 10 degrees below zero, about 55 per cent. of glycerine in the water is necessary.

"Twenty-five per cent. of half alcohol and half glycerine, added to water, will resist freezing at eight degrees Fahrenheit. 30 per cent, of half alcohol and half glycerine, added to water, will resist freezing at practically 10 degrees below zero.

"When the half and half mixture is used, the best results will be obtained by adding a small quantity of wood or denatured alcohol from time to time, as the weather gets colder.

"The right way to handle the cooling mixture is to find out the equation for your own car, using all the alcohol you can stand without boiling the mixture on mild days sure to be met in winter in this climate Some machines will stand all alcohol, that is, mixed with water; others will not and glycerine must be used to keep up the boiling point."

UNSOLVED PROBLEMS OF DESIGN

Dugald Crelk Outlines Future Experiment for the Engineer—The Existing Shortcomings of the Motor.

Among the better informed class of engineers the present day motor car is recognized as a very creditable working hypothesis for future developments rather than as a complete and wholly satisfactory mechanism. A large proportion of the difficulties which confronted the earlier designers with motoring in all its phases are well aware that the department of design is still contemplating a number of problems which are far from easy to cope with. Several of these problems, Dugald Crelk discusses in a presidential address recently delivered before the Incorporated Institute of Automobile Engineers, of Great Britain. "Ever since 1903," this eminent authority observes, "marvelous progress has been made, and most of the difficulties of the engine, clutch, change-gear and transmission have been met with such success that the flexible and smooth-running car of to-day appears to many so desirable as to present no further problems for the energy of the automobile engineer.

"To others the present cars appear to embody only partial solutions of many problems. The clutch, for example, even in its best form, is a contrivance which should be abhorrent to the soul of the mechanic. It is a practicable mechanism, no doubt, which causes less damage to transmission gear than would be expected, but this is largely due to the excellence of the material of the modern car and the intelligence of most car drivers.

"It has long seemed to me possible to design a pneumatic clutch connecting the engine and the driven shaft, so that no violent shocks could reach the transmitting mechanism. Such a clutch would consist essentially of two or more cylinders mounted on the end of the driven shaft and rotating with it, and a crank on the end of the engine shaft connected to two or more pistons working in the rotating cylinders.

"Change-speed gear also seems to be a very inferior mechanical device for varying the effort made possible to the road wheel. This has been much felt by motor car designers, and perhaps more mechanical ingenuity has been expended by them on various methods of getting a wide range of intensity of wheel effort without changing gear than on any other part of car mechanism. The system of gear changing by sliding toothed wheels, notwithstanding its apparent mechanical crudity, has proved to be the principal survivor in the struggle, and its efficiency of action has certainly been greatly improved. If we must have gear changed at all, the quiet and easy gear-change of to-day leaves little to be desired.

Digitized by Google

"Other efforts have been directed to the improvement of the petrol engine itself, with the object of dispensing with change of gear ratio as much as possible, and accordingly this mode of development has produced the moderately high-power car of today, with its direct drive, live axle, and highly flexible engine. Success in this direction requires an engine capable of giving the maximum torque required by the road wheels on steep hills while geared on the direct drive, and, of course, it involves a powerful engine which runs at a very light load at customary speed on the level. For the greater part of its running, the engine will be only developing about one-fourth of its maximum power in order that the full power may be available for hill-climbing, without requiring change of gear. The necessity of carrying about this heavy and powerful engine, for but a small use of its full power, has been justly recognized as a disadvantage, and many methods have been devised for temporarly increasing the driving torque to be obtained from a small engine. Such methods include: The petrol-electric car, in which an accumulator supplies an electric motor, giving power to the driving shaft when the resistance to motion increases sufficiently, while the electric motor acts as a dynamo, and charges the accumulator when the engine is running under conditions of lighter load, and proposed air reservoir cars, having pumps to fill up the reservoir, which, in turn, assist the engine when required.

"Other inventors seek to increase torque by providing air pumps supplying the air and petrol charge to the engine under a pressure above that of the atmosphere. Daimler was the first to propose this, and he has been followed by many, including Dawson and O'Gorman. They, however, require a heavier engine to withstand the higher maximum pressure of explosion; and although the cylinder dimensions remain small in reality, the weight of the engine, to provide the same margin of safety, requires to be increased as much as it would be by using larger cylinders.

"So far attempts to increase the torque of a small power light engine have failed; it is very desirable, however, to persevere, as it appears probable that a much better type of car is possible, and many advantages to the public would follow success.

"I have made experiments with super-compression devices of different kinds, which convince me that it is possible to arrange for the increase of the mean pressure upon the piston at the slower speeds of rotation by about 50 per cent. without increase of maximum explosion pressure. To do this it is necesstry not only to increase the charge supply pressure as proposed by Daimler, but also to increase the volume of the compression space. By the simultaneous increase of charge pressure and compression space volume, torque is greatly increased, although, of course, expansion is diminished, and the theoretical economy is somewhat reduced. My experiments have been made on relatively large gas engines, two engines of 22 inches cylinder diameter, one of 10 inches diameter, and another of 7 inches diameter, but the reasoning applies to small petrol engine cylinders. Such an increase of mean pressure as I have suggested would enable cars of moderate power to dispense almost entirely with change of speed gear. My present car, for example, would be able to climb all the hills in my district without changing from the direct drive on the third speed.

"If the pumping arrangements could be operated by a small separate petrol motor nicely balanced and always running, the main engine could be arranged to act as a compressed air engine only when in traffic or on hills at slow speed. The added engine and pumps increase the complication, but it seems to me possible to reduce total weight by the reduction of main engine dimensions and the simplification of gear-box arrangement. A car which could be stopped and started in traffic without the need of the clutch, and could stop on a steep hill in the same way, with the certainty of starting smoothly, would combine the advantages of both steam and petrol engines. . . . .

"As a power producer the horse must be considered as a motor of ideal flexibility; the horse can develop his 33,000 foot-pounds per minute, either by a small pull exercised through a long distance in the time, or a heavy pull through a short distance. He can either give a light or heavy pull, and develop the same total power either by motion at a higher or lower velocity.

The petrol motor cannot do this; within wide limits of speed no substantial variation of mean pressure on the piston follows change from high speed to low speed.

Assume a petrol engine to be running at 1,000 revolutions per minute under a mean effective pressure of 90 pounds per square inch, developing an indicated power of, say, 40 horse; then if the speed be dropped to 500 revolutions per minute, the mean pressure of 90 pounds will remain practically unchanged; if the valves are properly proportioned there will be little change in mean pressure. The engine at half speed will then indicate only 20 horse. To comply with ideal flexibility, 40 i. h. p. should be developed, and to do this 180 pounds mean pressure would be required. In the sense of ideal flexibility the petrol motor is conspicuously deficient.

"Assume, now, a steam engine of either the simple or compound type, to be supplied from a steam boiler capable of supplying steam at a given pressure and rate. The steam engine may consume the whole of its supply either at a high or low speed; take the same speed variation as supposed in the petrol engine, 1,000 and 500 revolutions per minute. At the high speed, a given point of cut-off will utilize the whole steam supply, and give, say, 40 i. h. p. at 90 pounds more pressure. At the low speed, 500 revolutions, the cut-off must be later to use the whole steam generated, and then the steam weight used per revolution will be doubled; the mean pressure will not be doubled, but it will be greatly increased. Say that it rises from 90 to 150 lbs. per square inch, then the i. h. p. at half speed will be 33⅓. The steam engine thus possesses considerable flexibility, although it has not the ideal flexibility assumed to exist in the horse.

"True flexibility in a motor requires the property of producing maximum power at both high and low speeds, and this property is to some extent present in the steam engine, and almost absent in the gas or petrol engine.

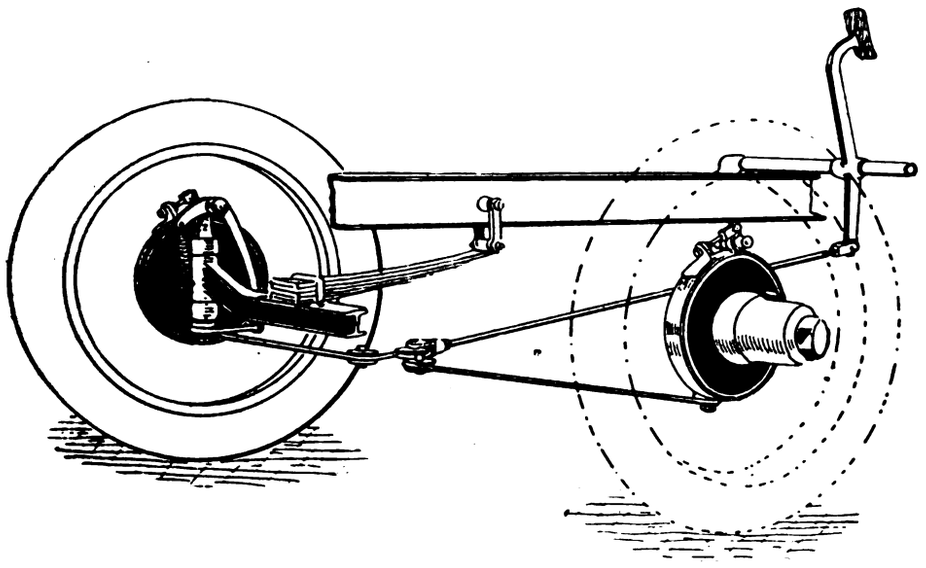
"What is commonly called flexibility in a petrol motor is in reality controllability, which is a different thing.

"The steam engine could be more closely followed in this matter by supplying the petrol motor with a constant or even an increasing weight of charge as the speed of rotation falls in the manner which I have already suggested. Recent improvements in the petrol engine, such as very large inlet and exhaust valves and very light pistons and moving connections, have made it possible to greatly increase the total power to be obtained from cylinders of given dimensions by permitting of longer strokes and higher speeds of rotation, while keeping up the weight of charge dealt with per stroke. . . . .

"While even better results may be desired on the two points—clutch connection and true flexibility—another important matter requires persevering attention. I refer to the exhaust products discharged into the air of our streets; the rapidly increasing use of motor cars raises study of the carburetter to a position of importance.

"It has been clearly proved that the product discharged from an engine when the mixture of petrol and air is properly proportioned is innocuous in its chemical nature; combustion is almost complete; but when proportion is incorrect, and vaporizing action imperfect, the products are noxious. Carburetters at present proportion correctly at two or at most three points of load and speed; at intermediate points some deviation occurs.

"The problem of proportioning accurately and automatically for all speeds and loads is one of great difficulty, and existing devices provide an imperfect solution. It cannot be too firmly borne in mind that a mixture of constant composition is required at low and high speeds and low and high loads.



"Methods of carburetter control which depend entirely on engine speed cannot produce accurate results, because the engine may run at the same speed under quite different conditions of throttle opening. What is really required, as I have already pointed out, is some method of controlling depending solely on the charge volume which passes the jet."

FRONT WHEEL BRAKES UNDER TEST

Details of Foreign Device Designed to Prevent Side Slip—Results of Severe Road and Hill Trials.

It is somewhat unfortunate that the subject of front wheel braking has been given so scant attention by American engineers as a class, as it is commonly recognized to be fraught with great possibilities in the way of preventing skidding and in equalizing tire wear—both, elements of expense and danger which the user would be glad to see disposed of to better advantage. In

England, where front wheel braking has been used to a certain extent upon tri-cars, there is a disposition to regard the subject a little more seriously than here, with the result that several systems have been devised. One of these which has recently come to notice is the Allen-Liversidge, which is so contrived that it may be operated irrespective of the position of the steering knuckles.

The general arrangement of the brakes in question may be seen from the accompanying illustration, shown by the Autocar, in connection with an account of a recent trial of the system. "In the Liversidge brakes," remarks the print in question, "the steering pivots are inclined, so that a line drawn through their centers, if produced, would reach the center line of the tire at its point of contact with the road. This, it is claimed, is equivalent to placing the brake drum head in the center of the wheel—a position which is the ideal one if the steering is to be unaffected. Levers of considerable length are fitted to exert the greatest possible amount of power upon the brake drums with the smallest possible movement of the wires."

By the use of a central drag link attached to the pedal and a cable equalizing device, the pull is transmitted to the levers of the individual brakes, which are arranged to swing with the knuckles and therefore preserve a constant relation to the drums at all times. The equalization compensates for the swing of the knuckles and is so contrived that it is possible to turn the wheels without interference even when the brakes are applied. In fact, according to the observer, no tendency to hinder the steering action was manifest during the test except such as was caused by the side-slipping of the front wheels themselves, due to their loss of traction when retarded and still urged forward by the momentum of the vehicle as a whole.

One of the principle advantages of front wheel brakes is their utility in correcting skidding tendencies brought about by the application of the rear wheel brakes. Referring to a trial intended to demonstrate this particular advantage the writer quoted mentions a stretch of road "having a surface which was distinctly treacherous."

"The back brakes were applied suddenly," he says, "and the car described a quarter of a circle, but before it had time to go any further—and it was fairly on the swing at the time— the back brakes were withdrawn and the front brakes applied, and the car came under control as if nothing had happened." On a hill test over a gradient of approximately 1 in 8, the front brakes alone were found to be sufficient to hold the car satisfactorily.

The makers of this arrangement are already preparing to fit front brakes to any car in place of the more usual propeller shaft or counter shaft brake, and so great is their faith in the system that they offer to remove it and replace the old foot brake in the event of failure in action. The alterations required in the car include a change in the angularity of the knuckles or pivots in cases where the pitch is not sufficient to bring the tread line of the front tires into the projected axis of steering movement, while in some cases the stub axles also require to be reinforced.

STUDYING THE SLIPPAGE PROBLEM

Facts Developed by Long Series of Tests on the Brooklands Track—How Speed Increases Amount of Slip.

How far the frequently excessive wear of the rear tires of a motor car may be governed by the slippage of the wheels, and what factors may be taken into account to reduce this element of annoyance and expense is somewhat difficult to determine at the present time. Certain it is that because of the tractional stresses upon them, the rear tires do slip a good deal more than the front ones and that this results not infrequently in tearing the casings when rough roads are being traversed while under even the best of conditions, it results in a rate of wear which is unpleasantly high.

Hitherto the subject has been given scant attention by engineers. Within a year or so, however, a series of tests have been made on the Brooklands track in England to determine the necessary slippage data on a basis of wheel revolutions, comparing the number of turns made by front and rear wheels, respectively in covering a given course under certain conditions. These results were presented without analysis at first and therefore were of small value to the layman. Reduced to general terms by Henry Souther, technical expert of the Mechanical Branch of the Licensed Association of Automobile Manufacturers, these figures go to show that under the conditions of test the actual slippage may vary from 0.3 per cent. at a speed of 40 miles per hour to as much as 5.4 per cent. at 90 miles an hour.

The tests in question were made on the ideal surface of the Brooklands course, and with round tread tires inflated to racing pressures, so that the results form merely a basis for further investigation. How far the actual slippage on the common highway would be influenced by the altered condition of the road surface is indeterminate just at present. At the same time, these experiments are of great value in calling the attention of motorists and engineers to the fact that the actual amount of slip is really much greater than might be anticipated.

A peculiar fact brought out in this connection is that in making turns the inside wheel tends to slip a very little more than the outer one. According to Souther's analysis of the results, this is accounted for by the fact that the centrifugal tendency due to the curvilinear motion of the machine as a whole tends to lighten the pressure on the inner wheel, thus reducing its adhesion and so permitting it to slip a trifle more than the outer wheel, which, of course, has additional pressure brought to bear upon it in proportion to the lightening of the inner

Digitized by Google

one. The possibility of excessive differential action is taken into account.

With this basis to work upon, it is greatly to be hoped that further results of a more useful nature will be obtained within a short time, in which varying conditions of road surfaces, tire pressures, weight distribution in the machine, and the variation of slippage with different tire tread surfaces, are taken into account in their proper relation. The subject is of vital importance to the industry as a whole, because of the universal interest attached to tire economy. The British investigators are now well armed for research, having devised special apparatus for the purpose of recording the revolutions of the individual wheels, together with the distance traveled, the speed of the car, and other necessary data. But up to this time little or nothing in this direction has been done in America.

The percentages of slip recorded in the primary tests already reported, as deduced by Souther, are as follows.

0.3 for a speed of 40 miles per hour.
0.6 for a speed of 50 miles per hour.
1.1 for a speed of 60 miles per hour.
1.8 for a speed of 70 miles per hour.
3.7 for a speed of 80 miles per hour.
5.4 for a speed of 90 miles per hour.

Pyrotechnic Disclosure of a New Danger.

A hitherto unsuspected element of danger to the motorist has developed in the broken non-skid chain with flapping ends. One phase of the danger it presents was illustrated in New York City on Sunday evening last, when a dangling tire chain on a car driven by John Casey caught and lodged in the slot of the northbound tracks of the Broadway surface line, at Thirty-fourth street, and when a strip of the chain hung down and touched the power rail, a display of pyrotechnics and a roaring sheet of flame swept along the line for a distance of three blocks, making the Great White Way still whiter. The driver was thrown from his seat when the links caught and the car had to be pushed off the track to prevent it from being burned. For more than 20 minutes, flames sputtered away until a wrecking crew arrived and pried the slot open, releasing the piece of chain. As such devices frequently weaken and break, particularly in the tread portions, a ragged end is liable to be pressed into a slot or to become otherwise entangled, with the danger of a repetition of accident of this sort.

Commission Fixing Horsepower Basis.

Horsepower in all its vagaries and uncertainties is now in a fair way to be cleared up and put upon an equitable basis. A commission of British engineers has been appointed to digest the matter in its fullness and recently went into executive session in London. The commission is composed of members delegated by the Royal Automobile Club, the Society of Motor Manufacturers and Traders and the Institution of Automobile Engineers.

EXPENSES OF THE PRIVATE CAR

Cost of Maintenance and Operation Shown by an Owner's Statistics—Suggestions for Economy in Tire Upkeep.

Maintenance and operating cost for the private owner, while enjoying a temporary lull as a subject of discussion in a competitive way among manufacturers, is nevertheless a matter of diligent inquiry by prospective buyers. In response to a request for figures as to the cost of running a car, based on experience, the owner of a large machine, driven by a chauffeur, has contributed an account of his own expenses, together with some excellent recommendations as to keeping down the tire bills.

"Since 1900 I have owned cars which have made more than 60,000 miles. Since April, 1906, I have operated one seven passenger car 30,000 miles and have paid every item of cost by check, and I have recently compiled the statistics of cost," he declares, by way of qualification. "The items of direct cost, which vary directly with the mileage, are:

	Cost a mile.
Tires	5.0 cents
Gasolene	2.7 "
Lubricating oil	.2 "
Incidentals	.9 "
Total	8.8 "

"My car averages 1,000 miles a month. It makes a yearly average of 7½ miles a gallon of gasolene. It makes 205 miles a gallon of lubricating oil.

"Disregarding interest and depreciation, which is largely a matter of judgment, and assuming the car to be owned in a suburb of New York City and that it makes an average of 1,000 miles a month, the following is my estimate of cost a year:

Tires	$500
Gasolene, oil, acetylene and repairs	500
Chauffeur and rental private garage	1,300
Direct cost a year	$2,300

"The most difficult item to keep down to the above figures is 'tires.' I now use demountable rims and 4½-inch tires exclusively. I carry in the rack two blown up tires upon their demountable rims, and have a seventh tire and rim habitually at the repair shop. The secret of low tire cost is continual repairs made as soon as needed. With seven demountable rims and tires it is no trouble to keep the tires always vulcanized and in perfect repair. Whenever a cut reaches the canvas that rim and tire should go at once to the repair shop and a spare one should be substituted. Such repairs cost but little and the repaired tire, blown up on its rim and ready for use, can be returned to you the next day. My chauffeur is as good as they grow them near New York, but until I got demountable rims and discovered a reliable tire repair shop I found it impossible to keep my tires always in proper shape. Insist upon vulcanized repairs whenever you can see the canvas; keep your tires pumped to 80 pounds and have seven identical demountable tires and rims, and you can make the tire cost only three or four cents a mile."

Cleaning and Adjusting Spark Plugs.

Most motoring novices learn how to clean and adjust spark plugs properly without much difficulty, but frequently are surprised to discover that their efforts are of small avail. One reason for this is that not infrequently when endeavoring to insert a plug in a hot motor the nervous driver knocks the sparking end against the cylinder opening in trying to locate the thread. The usual result is that the points which have been so carefully adjusted are forced together once more and consequently the expected forceful spark fails to materialize. A further source of difficulty in the same connection arises from the inbred conviction that once attended to the plugs require no further inspection, so that when this happens the trouble hunter wanders off vaguely and needlessly into the intricacies of coil adjustment.

Law Suit to Suppress Garage Noises.

Annoyed by the intermittent explosions from gas engines used by the Star Electrical and Garage Co., of Erie, Pa., a number of property owners in the neighborhood have filed a bill in equity against the concern, asking damages and praying for an injunction which will put a stop to the engines. The bill sets forth that the noise has inconvenienced and distressed the plaintiffs and their families, depriving them of sleep and thereby endangering and injuriously affecting their health. It also is claimed that property values have been lowered as a consequence of the noise, and special complaint is made of the fact that the garage frequently operates all night working on automobile repairs.

Louisville Imposes Tax on Garages.

Automobile dealers of Louisville, Ky., are chafing over the recent passage of a license ordinance which provides for an annual assessment on all garage proprietors regardless of the number or class of machines housed. The ordinance provides that "Each person, firm or corporation who keeps or operates a public garage in which automobiles or similar machines driven by gasolene, steam or electricity are kept in storage or for sale or rent, shall pay a license of $100 per year."

Norfolk Has Automobile Milk Wagon.

Milk delivery by automobile has had an introduction on this side of the water. C. A. Bremer, owner of the Paradise Creek dairy, at Norfolk, Va., has a motor car milk wagon in service which is attracting great attention.

FIGHT AGAINST MAIL ORDER FINES

Trenton Magistrate's "Absent Treatment" Undergoes Legal Scrutiny—Test Case Pending in Higher Court.

"Absent treatment" of the foreign invader of New Jersey's peaceful countryside after having constituted a source of untold annoyance to the motorists of other states for many months as well as an occasion for considerable expense, the legitimacy of much of which is in question, is now receiving the attention of the courts through a civil action which has been instituted by the Automobile Club of America, through Attorney Richard Boardman, of Jersey City. Manfred Naar, a Trenton Justice of the Peace, is being sued for the recovery of a fine which it is charged he imposed by mail upon an absent motorist for an alleged violation of the speed law. The case is the outcome of a long series of complaints which have been received from motorists who have been, to to speak, arrested, tried and fined by mail, and is brought as a test of the legality of the method.

According to the complaints upon which the A. C. A. has based its action, Naar's method was to have a constable concealed along the Hightstown road for the purpose of jotting down the numbers of passing automobiles. Shortly afterward the owners of cars corresponding to the numbers caught in this way would be notified that they were accused of violating the speed law on a certain day, and proposing to fix a day for trial at Trenton. As the notices were sent largely to non-residents of the State, many of whom would find it a hardship to spend the better part of a week day in Trenton, the accused would ordinarily reply to that effect, upon which a second letter would be received stating that the entire matter could be disposed of by the payment of a fine and costs. The fines ranged rfom $1 to $25, and the costs amounted to about $3.50. Counting the value of his own time into account, together with the expense of the trip to Trenton, the motorist usually found it cheaper to submit to the mail order method of punishment than to stand trial in the regular way. Hence the formality of a defense was usually foregone and the fine paid without question, although in some cases, it is said, the owners themselves were not in their cars at the time of the alleged violation of the law.

When brought to the attention of the A. C. A., the matter was referred to Chairman Winthrop E. Scarritt, of the committee on public safety, who in conjunction with the club attorney, W. W. Niles, made a thorough investigation and then arranged for the prosecution of the test case. The attention of the criminal authorities of Trenton also has been called to Naar's methods, and if the contention that they are illegal is upheld, an effort will be made to secure an indictment against him.

In a wordy defense, Squire Naar responds through a local newspaper that he never "instructed nor had paid officers on any roads of this county for the purpose of taking the number of any automobile passing through"; that he has issued summonses on about 2,000 complaints sworn to before him, and that in the vast majority of cases "summons have been served and service acknowledged by persons complained of for violating the automobile law." He justifies his system of notification on the basis of arranging for trial at the convenience of himself, and the accused, and alleges, "In each and every case where I have imposed a fine it has been where the parties complained of pleaded guilty."

Chicago Club Elects Opposition Ticket.

The "opposition ticket," as it was called, scored a decisive victory at the annual election of the Chicago Automobile Club, held on Thursday, November 12. The ballot resulted in the following members being chosen by a large majority: Ira M. Cobe, president; T. N. Koehler, vice-president; T. J. Hyman, second vice-president; C. A. McDonald, secretary, and George S. White, treasurer. The directors include B. B. Johnson, Claude Seymour, J. F. Gunther, Allen S. Ray, F. W. Blocki, and John Farson.

There were three separate factions in the field; the "administration" ticket, the "members" ticket, which was the choice of the nominating committee, and the "oppositionists" who sprang up at the eleventh hour. It seems that the latter coterie did not care for the other candidates nominated, with the exception of president Ira M. Cobe, who was endorsed by all and sure of re-election. So the "antis," the majority of whom are members recruited during the past year, headed by Ban Johnson, of baseball fame, put up a slate of their own and did considerable electioneering with remarkable success, for of the 210 votes cast, 115 were straight ballots for the latter party, and 59 split ballots also favoring it.

In his annual report, president Cobe asked the members to join in assisting the passing of the proposed convict labor law, for the purpose of furthering the interests of good roads. He also expressed his hopes of holding the much talked of Jefferson De Mont Thompson stock chassis race on an Indiana course next year and was in favor of making the inter-club contest with the Chicago Athletic Club an annual event.

Boston Gives Archbishop a Car.

At least one congregation has settled the burning question, "Should clergymen motor?" in a satisfactory way. Archbishop O'Connell, of Boston, has been presented with a luxuriously appointed landaulet by the Catholic laity of the Hub.

RURAL COURT PRACTICES REBUKED

Conviction of Motorist Reversed for Irregularities—Pennsylvania Court Renders Important Decision.

Important as a victory over the system which has for some time prevailed in Pennsylvania of noting the numbers of cars passing through speed traps and convicting their owners summarily, a decision of grateful import to motorists has been handed down from the bench in the common pleas court of Montgomery county. In effect, the decision will make it a great deal harder for constables and rural magistrates to make their mulcting program stick, and will free automobilists from much legal embarassment. Charles W. Bacon, a real estate dealer of Philadelphia, determined not to submit to the results of the action of a local magistrate in declaring him guilty of speeding on evidence consisting merely of the taking of his number. He secured a reversal of the local magistrate's decision.

"The record of the justice sets forth that an automobile, No. 15,775, was driven on a public road in Lower Providence township at a rate of speed exceeding that allowed by law," says Judge H. K. Weand, in his opinion; "but there is nothing to connect the defendant with the car or the act. It is not set forth that he was the owner of the automobile or in it at the time.

"If he did own it, and it was used without his knowledge, orders or consent, he would not be liable, otherwise he could be sent to jail for an act done without his knowledge by persons for whose acts he would not be responsible.

"To sustain this conviction we must hold without evidence, that he was the owner and its occupant at the time alleged, or at least that it was being used for his purpose and by his consent.

"A summons was issued and defendant appeared and made no defense. As there was no evidence connecting him with the violation of the law he was not required to make a defense.

"The proceedings are otherwise irregular in that the justice after fining the defendant required him to give bail for his appearance at court. And, November 12th, 1908, after argument and due consideration, the exceptions are sustained and proceedings set aside."

Show Profits to Pay for Club House.

Profits from the Denver automobile show, which is to be held under the auspices of the Denver Motor Club about December 1, are to go toward the establishment of a country house for the club. The show will be held in the Denver auditorium. The club is spending its present surplus in posting the route from Denver to Colorado Springs.

AUTOMOBILES MAY OPEN ALASKA

Systems of Good Roads Making a Tourists' Paradise—Motor Cars the Probable Precursors of Railways.

Frigid, barren and uninviting as Alaska may sound to the uninitiated, as a place for automobile touring it will before many years make a strong bid for popularity, according to those familiar with the country. This is due to the fact that the whole interior is being opened up by a series of splendid roads, which in structure and in scenic beauties are to rival those in any other portion of the world. The projection and building of these roads is under the charge of the Alaska road commission, a government institution, and the highways that are at present planned and under course of construction will make the whole Alaska district easily accessible by motor car.

Contrary to popular impression, the climate of Alaska is exceedingly mild and agreeable during the summer months, resembling that of the northern states in the late summer or early fall. In portions nearer the Pole, the constant daylight presents novel phenomena for the summer tourist, but otherwise the country does not differ materially from the more rugged portions of the United States.

In outlining what is being done, Major W. P. Richardson, chairman of the road commission in Alaska, who has recently returned from the scene of his labors, makes it clear that the roads are to be of a character that will make them entirely suitable for automobile travel.

"As each year passes," he said, "we have the pleasure of knowing that the trunk line roads are being connected to such an extent that it will be only a few more seasons until summer travel in Alaska will be as easy as it is in any state. In fact, I think when we have our roads completed some of the states might pattern after us.

"If any one will look at a map of Alaska he will see that the greater part of the exploited territory is at or near the rivers. This is a simple way of saying that steamboats have been the only means of summer communication, except where roads have been constructed from trading posts to the diggings. All this will change when we have completed the three big lines of trunk roads planned and to a certain extent carried out.

"Beginning at Valdez," continued Major Richardson, "we now have a fine road up through Keystone canyon to Wortmans. That canyon, which has blocked more travel than any one piece of river in all Alaska, can freeze or stay open, we care not which. A road was blasted out of the solid rock to get through, but it was worth the money. At the same time it is a scenic road, for it is nothing but a shelf, in many places the rocks hanging right over the road. From there across Dutch Flat a fine road had been built to Wortmans, and an eight foot trail, which can be traveled by a wagon or automobile, having an easy grade, leads over Thomson Pass.

"Next year we intend to put a bridge across the Gulkana River and with the road we have partially and fully completed, added to what we will do next year, the line will be ready for stages the following year. I rode on a buckboard for 150 miles out of Fairbanks and made fine time. Next year we will widen the road down the Big Delta and put a ferry on the Tanana at McCartys. During the past summer three droves of cattle were driven from Valdez to Fairbanks.

"I am saying we are going to do this. It depends, of course, on our appropriation. We will go before Congress at its next session with a well-defined plan for completing the roads we have planned.

"During the past summer we have built a fine wagon road up the Porcupine country from Haines. This road is now at the boundary line, and we hope to get enough money to put it through to the head of the White and Tanana rivers, forming a junction with the Valdez road at McCartys. If we can get the money to complete this road, we will have accomplished something which will open up thousands of square miles of a rich country, only awaiting transportation, and the roads will make it possible for miners to begin that development which in a few years will attract railroads.

"Our other trunk line road, which may be held back for a year or so to see what development takes place on the Kuskokwim and the Innoko, is planned from Sunrise, on Cook inlet, up through the Sustina valley, across the head of the Kuskokwim, through the Innoko country, across the Yukon at Kaltag, and thence to Norton Bay. If the country this proposed line passes through makes a substantial showing, the road will without doubt be built at once, for I have found Congress willing to give the money when it can be shown that any region is producing something good.

"Now, while these trunk lines will mean much to the big camps, the branch lines will be come the feeders that will make these highways alive with people in a few years. Over these roads the poor man can walk to his destination. Freighting teams can deliver supplies at places, at a fair cost, which now it is almost impossible to reach with provisions. Winter or summer, the roads are there to travel, and, instead of a spring rush in and a fall rush out, a man will come and go back when he pleases. Mail will not be held back for days because some boat gets on a bar. It can be delivered summer and winter on a regular schedule. The man on foot, with a dog team, horse and cutter or automobile are on a level. The roads will be there for their use."

$50,000,000 WANTED FOR ROADS

Pennsylvanians Move to Promote Legislation for Highway Improvement—Three Measures Proposed.

Spurred by the example of New York and the New England States, the good roads enthusiasts of Pennsylvania are making an assault on the Keystone State's legislature with a view to prying out $50,000,000 for highways. Foremost in the work is the Pennsylvania Motor Federation's good roads committee, which has appealed to the mayors of 1,000 cities and to 6,000 township commissioners and road supervisors to join together an an auxiliary committee and get all the signatures possible to a set of petitions which will soon be presented at the state capitol.

The petitions ask the members of the legislature to support three separate good roads bills in the next session and also to appropriate not less than $3,000,000 for use under existing laws. The first of the proposed bills provides for a constitutional amendment authorizing the issuance of $50,000,000 in bonds for highway improvement. The second bill asks for an appropriation of not less than $5,000,000 for immediate use, and also for the appointment by the governor of a state board who shall designate the location of the main state highways to be constructed and maintained by the state, as well as determine where the state aid system shall be applied, and further provides that such board shall be authorized to purchase certain toll roads. The third measure comprises a plan for the application of preservatives to the stone roads constructed by state aid. The revenues necessary tor this plan would be derived from motor vehicle license fees. The three bills are designed to work in harmony to effect the one purpose, and, as indicated in the description, are practically complementary to each other.

"Even under the most favorable circumstances, it will take five years to obtain an amendment to the constitution whereby the $50,000,000 in bonds may be issued," explained J. H. Weeks, chairman of the good roads committee. "It is because of this fact that the second bill was drafted by the federation asking for an immediate appropriation of $5,000,000. This will give us an opportunity to secure a partial improvement of the state's bad roads now, inasmuch as it can be passed immediately under the present laws. We expect to obtain the signatures of 80 per cent. of the voters in every election district in the state to the petitions which we have sent out, and by the early part of January we further expect to be able to go to Harrisburg with something like 700,000 or 800,000 names on our list."

Made In Bridgeport

An Appreciation of

The Locomobile Company of America

From

The Bridgeport Board of Trade

Whereas, The contest for the **Vanderbilt Cup**, the most highly prized trophy in the world for the winner of an international automobile road race, was won by **George H. Robertson** on the 24th day of October, 1908, by covering a distance of **two hundred and fifty-eight and 6/100 miles in two hundred and forty minutes and forty-five seconds**, in a ninety horse-power **Locomobile Made in Bridgeport** by **The Locomobile Company of America**, being the first American driver and the first car of American manufacture to be the victor in this international struggle for supremacy; and

Whereas, The automobile whose position in the race would have been third had the crowded track permitted the car to finish, was also a **Locomobile** manufactured by **The Locomobile Company of America** and driven by **James Florida**; and

Whereas, Notwithstanding the skill, hardihood and daring of the driver, the race could not have been won but for the **superior strength, design, workmanship and construction of the Locomobile**; therefore be it

Resolved, That The Bridgeport Board of Trade, recognizing that this gives the city of Bridgeport further cause for Local Pride, expresses and it does hereby express its appreciation of the honor done to Bridgeport, The Industrial Capital of Connecticut, by The Locomobile Company of America, in so perfecting its manufacture as to produce a car capable of defeating all other entries both foreign and domestic, of breaking the time record in the international race for the Vanderbilt Cup and breaking all records in America for road racing; and be it

Resolved, That The Bridgeport Board of Trade express, and it does hereby express its appreciation of the Ability, Talent and Genius of the designer of the Locomobile, Mr Andrew L. Riker; and of the skill, careful and exact workmanship and the thorough mechanical knowledge of the highly trained mechanics of Bridgeport, all of which brought the glory for the winning of a hard fought contest to the city of Bridgeport; and be it

Resolved, That these resolutions be suitably engrossed and presented to

The Locomobile Company of America.

Fred Cook President.
William Adwicky Secretary.
Treasurer.

The Week's Patents.

895,437. Tire Protector. Louis Crise, Upper Sandusky, Ohio, assignor of one-half to Charles F. Close, Upper Sandusky, Ohio. Filed Nov. 15, 1906. Serial No. 343,616.

1. In a tire, the combination with a wheel rim, of a pneumatic tube open at its inner side only and having the said inner side secured to the wheel rim, clamping plates fitted against the outer portion of the tube and partially encircling the same, said plates having outstanding flanges, a solid cushion of yielding material fitted between the plates and bearing against the outer side of the tube, said cushion projecting beyond the flanges, and means for connecting the plates together and clamping the cushion between them, and plates and cushion being removable from the tube without affecting the engagement of the latter with the rim.

895,301. Tire. Alfred G. Ritchie, San Jacinto, Cal. Filed Aug. 7, 1907. Serial No 387,467.

1. A vehicle wheel having a rim provided with peripheral flanges one of which is removable, in combination with a cushioning tire having recesses in its inner side forming localized air cushions therein and bolts connecting such flanges together, extending through such tire and also extending through certain of such localized air cushions.

895,525. Brake Mechanism. Rollin H. White, Cleveland, Ohio, assignor, by mesne assignment, to The White Company, Cleveland, Ohio, a Corporation of Ohio. Filed May 10, 1906. Serial No. 316,074.

1. In an automobile, the combination with the rotatable wheel, a brake drum fixed thereto, and a non-rotating disc within said drum in a plane at right angles to its axis with arc shaped brake shoes located within said drum and provided with internal circumferential grooves which embrace the edge of said disc, means for thrusting said shoes apart and into contact with the drum, and a spring for drawing apart and into contact with the drum and a spring for drawing said shoes together upon said flange.

895,557. Lubricator. Charles C. Haller, Chicago, Ill., assignor to McCord & Company, Chicago, Ill., a Corporation of New Jersey. Filed July 25, 1907. Serial No. 385,511.

1. In a lubricator, the combination of a casing having admission and discharge ports, a cylindrical valve adapted to oscillate for communicating with the ports in said casing, a piston working in said valve, tappets in said casing and having ports therein pets for operating said valve and reciprocating said piston and a rotating member common to said tappets for operating them.

895,561. Vehicle Wheel. John B. Hembree, Piedmont, S. C. Filed May 21, 1907. Serial No. 374,816.

The combination with a solid rim or felly having an annular transversely concaved channel in its periphery and sets of opposite spaced undercut elongated sockets opening into the opposite sides of the channel and disposed at intervals about the rim or felly longitudinally thereof, said sockets tapering toward their inner ends to substantially sharp corners and having flat end walls forming stop shoulders, of a pneumatic tire that is seated in the annular channel, said tire comprising a single integral yielding wall that is substantially circular in cross section and has oppositely outstanding integral spaced elongated lips or tongues of yielding material located at intervals around the inner side thereof on opposite sides of the center of its inner wall and engaged in the sockets of the rim or felly, the lips or tongues being outwardly tapered to substantial edges and filling the sockets, said lips or tongues having flat ends disposed at substantially right angles to the tire wall and abutting against the flat end walls or shoulders of the sockets, said tire being thereby interlocked with the rim or felly and being held by said abutting end walls or shoulders against longitudinal movement or creeping thereon, the lips or tongues slipping freely into and out of the sockets when the tire is deflated.

895,618. Power Transmitting Device. Leonard K. Clark, New York, N. Y. Filed Nov. 20, 1906. Serial No. 344,348.

1. In a power transmitting device the combination with a generator having a rotary armature member and a rotary field member and a motor having a rotary armature member and a fixed field member; of means for rotating the field member of said generator and means for coupling together and uncoupling the generator armature member and the motor armature member.

895,632. Collapsible Foot-Rest for Vehicles. Charles J. Harris, Bridgeport, Conn. Original application filed Nov. 5, 1906. Serial NoN. 341,966. Divided and this application filed May 22, 1907. Serial No. 375,127.

1. A collapsible foot rest for vehicles, comprising a pair of notched plates, a foldable jointed frame consisting of side links pivotally connected to one another and at their opposite ends provided with means for removably engaging said notches, and a foot board secured to the corresponding side links.

895,645. Valve Timing Device for Explosive Engines. Lester L. Kell, St. Louis, Mo. Filed Dec. 17, 1907. Serial No. 406,903.

1. In a device of the class described, the combination of a support, a longitudinally movable element on the support, a yielding means for holding the element in normal position, an adjustable member normally separated from the element and movable therewith, a member yieldingly engaging the adjustable member for holding the latter in normal position, means for connecting the second member to one side of a signal including circuit, and means for connecting the element with the other side of such circuit.

895,661. Automobile Construction. William Morrison, Chicago, Ill., assignor of one-third to M. A. Lumbard, Des Moines, Iowa. Filed Oct. 31, 1904. Serial No. 230,877.

1. An automobile comprising vehicle wheels, a suitable body, a motor swingingly mounted on said body, springs interposed between said body and wheels, said motor having a casing composed of segment shaped sections, said sections being adapted to provide a hollow flanged boss, a sprocket wheel having its shaft extended through said boss and connected with the motor shaft, a rear axle construction having a casing provided with a hollow flanged boss, another sprocket wheel provided with a shaft extending through said last mentioned hollow boss and suitably connected with the rear axle of the vehicle, a sprocket chain connecting said sprocket wheels, and a casing inclosing the chain and sprocket wheels, the said casing thus inclosing the sprocket chain and the sprocket wheels being divided both longitudinally and transversely into sections which are rotatably mounted upon said hollow flanged bosses, and a threaded coupling adjustably connecting the ends of said sections, whereby the proper distance is maintained between said sprocket wheels.

895,670. Speed Indicator. Edd C. Oliver, Minneapolis, Minn. Filed July 8, 1907. Serial No. 382,681.

1. In a speed indicating device, the combination, with a rotating spindle, of a weight centrally pivoted thereon, a spring connected with said weight and arranged to swing on a different center, whereby it will be put under tension by the oscillation of said ring, the longitudinal axis of said spring intersecting approximately when extended, the pivot of said weight, when in the normal or zero position and a dial having an indicator hand and means for transmitting the movement of said ring to said hand.

895,709. Carburetter for Hydrocarbon Engines. Edwin F. Abernethy and George H. Abermethy, New York, N. Y. Filed Jan. 19, 1904. Serial No. 189,671.

1. In a carburetter, a fuel valve provided with a plurality of fuel passages, adjustable means co-operating with said valve for varying the area of said passages, and means operated by a suction draft through the carburetter for operating the fuel valve.

895,732. Construction of Batteries and Electrolytic Apparatus. Frank A. Decker, Philadelphia, Pa., assignor, by mesne assignments, to Decker Electrical Manufacturing Company, Wilmington, Del. Filed Feb. 11, 1905. Serial No. 245,223.

1. In apparatus of the class described, a plurality of battery parts forming several compartments, said parts being secured together and sealed by a plastic vulcanized in place, thereby rendering said compartments liquid tight.

895,762. Detachable Rim for Automobile Tires. Richard E. Jeffery, Piedmont, Cal. Filed March 20, 1907. Serial No. 363,403.

A wheel rim comprising a rim portion, a rim section surrounding said portion and secured thereto, said section having an annular flange surrounding one edge, a ring thickened along one edge and secured to said section, and having the remaining portion reduced in thickness to form an annular socket between the reduced portion and the corresponding portion of said section, and a removable section having an annular flange surrounding one edge and having bayonet-slots opening through the inner edge of the removable section being adapted to enter edgewise and be inclosed in the socket formed beneath the ring, lugs struck up from the face of the fixed section and adapted to enter and interlock with the bayonet slots of the removable section, and spring pressed latches carried by the rim and passing through the fixed and removable sections to lock the sections, said latches having offsets normally fitting perforations in the fixed section, said latches being capable of a limited rotated movement to carry said offsets out of said perforations to thereby hold the latches in inoperative position.

895,767. Radiator. Thomas J. Kehoe, Dayton, Ohio. Filed April 5, 1906. Serial No. 309,990.

1. In a radiator having parallel hollow sections, a series of plates each of which has numerous protruded tongues on one of its sides, said plates being secured respect-

Digitized by Google

ively with their flat sides against the corresponding sides of said sections.

895,838. Automatic Pump for Tires. James C. Booth, Columbus, Ohio. Filed Aug. 16, 1906. Serial No. 330,800.

1. The combination with an axle having wheels journaled thereon and pneumatic tires carried by said wheels and with air valves operative through the rims thereof, of circular plates secured to said wheels, eccentrics revolubly mounted upon said plates and each having a laterally inward extending stop lug, and laterally extending fianges adapted to receive fastening means, eccentric bands mounted upon said eccentrics, pump cylinders pivotally carried by said wheels adjacent to the tires thereof and connecting with the air valves of said tires, pistons operating with the air valves of said tires, pistons operating in said cylinders and connecting with said eccentric bands, rods slidably mounted upon said axle and adapted to engage the stop lugs of said eccentrics, and means to move said rods, substantially as described.

895,941. Vehicle Wheel. Linda H. Barry, Durango, Mexico. Filed Oct. 10, 1906. Serial No. 338,263.

1. A vehicle wheel, comprising a rim, a plurality of longitudinally curved spring members clamped to the rim and formed with upwardly and inwardly-curved ends, a plurality of longitudinally curved springs forming tread members, the outer ends of which are curved downwardly and inwardly and are overlapped by the curved ends of the first named springs, clips having sid: flanges between which the curved ends of the respective spring members are received, and means for uniting the clips to said curved members.

895,958. Electromagnetic Sparking Plug. Otto Carlborg, Providence, R. I. Filed June 9, 1906. Serial No. 320,972.

1. In an electric-magnetic sparking plug of the character described, the combination with a lower section or plug member proper adapted to be removably secured to the cylinder of an explosive engine, and normally contacting fixed and movable electrodes mounted in said section, of an upper section secured to said lower section so as to produce a comparatively large open air-circulating space between their adjacent ends, an electro-magnet and armature mounted in said upper section and operatively connected with said electrodes so that when in use upon energizing the magnet the resulting movement of its armature automatically separate said electrodes to produce an electric spark, the heat from the plug at the same time being materially reduced or tempered by air circulatnig in the said open space, substantially as described.

895,975. Auxiliary Relief Wheel Rim for Motor Cars and Vehicles. Thomas M. Davies and Walter Davies, Llanelly, England, assignors to The Stepney Spare Motor Wheel, Limited, Llanelly, England. Filed April 11, 1904. Serial No. 202,582.

1. The combination of an auxiliary wheel rim, inwardly projecting radial guides fixed to said rim, an abutment upon each of said radial guides, a hook-shaped clip movably mounted in each of said radial guides and adapted to engage the outer periphery of a vehicle wheel rim, and adjustable means securing said hook shaped clips to said abutments, substantially as herein shown and dscribed.

895,982. Gasolene Engine with Mixing Cylinders on Crank Cases. Frederick A. Dobbins, Newark, N. J. Filed June 21, 1907. Serial No. 380,024.

1. The explosive vapor engine having an explosion cylinder, the crank-casing below such cylinder having bearings at opposite sides, with crank shaft extended across the same and provided with a bent crank below the explosion cylinder and with an eccentric at the side of each crank arm within the bearings, a gas mixing pump cylinder projected horizontally at one side of the casing, and the two eccentrics having direct connections to the pump piston, equi-distantly from the center of the piston whereby the pump cylinder may be disposed upon the center line of the bent crank and bedplate.

895,984. Pneumatic Hub. John Duchan, Elizabethport, N. J., and Roland Duchen and Johann Duchan, Vienna, Austria-Hungary. Filed March 16, 1907. Serial No. 362,662.

1. In a wheel, is combination, a hub having a bore, a tubular case received in said bore and presenting a projection on the inner side thereof, a sleeve, and a pair of pneumatic pads disposed around said sleeve and filling the space between said sleeve and said case, said projections affording means for preventing the rotation of said pads relative to said case.

896,034. Transmission Gearing for Automobiles. Grover I. Mitchell, Cornell, Ill. Filed April 4, 1908. Serial No. 425,105.

1. In a transmission gearing for automobiles, a motor driven shaft having a thrust bearing, a wheel upon said shaft having a friction rim, a transmission shaft suitably supported in axial alignment with the motor drives shaft, a hub supported slidably and adjustably upon the transmissios shaft for rotation therewith and carrying a wheel having a friction rim, a shaft supported slidably at right angles to the motor driven shaft a friction disc carried by said motor driven shaft adapted for engagement with the rims of the wheels upon the motor driven shaft and the transmission shaft, and a spring supported idler adapted for engagement with the face of the friction disc.

896,057. Automatic Starter for Gasolene Engines. Franklin A. Corey, Santa Paula, Cal. Filed Dec. 16, 1907. Serial No. 406,806.

1. In an automatic engine starter, a casing provided with a recessed hub, a recessed collar in said hub adapted to be secured to said shaft, balls mounted in said recesses, means for locking said casing against rotation in one direction, a spring within the casing having one end secured thereto, and intermittent grip mechanism for detachably connecting the other end of the spring to said shaft.

896,104. Guard or Fender for Vehicles. Charles W. M. Guhle, Philadelphia, Pa., assignor of one-third to Frederick J. Ritter, Philadelphia, Pa. Filed Jan. 20, 1908. Serial No. 411,594.

1. The combination with the running gear of a vehicle, of protective means extending outside of said running gear, parts of said means being pivoted to said vehicle to permit the same to be swung clear above the running gear.

896,112. Starting Device for Hydrocarbon Engines. Russell Huff, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a Corporation of West Virginia. Filed Nov. 30, 1907. Serial No. 404,522.

WANTS AND FOR SALE

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets of the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

STODDARD-DAYTON demonstrators for sale. Runabout, Roadster, Touring car, Cab and Limousine, thoroughly overhauled. THE DAYTON MOTOR CAR CO., Dayton, Ohio.

Why pay high prices FOR ALUMINUM Axle Covers, Engine Crank Cases, Transmission Cases.

Have these made of Pressed Steel JUST AS LIGHT Stronger. Much Less in Price.

Send Prints for Estimates.

PANHARD OIL

"The Oil in the Checkerboard Can"

Is the one perfect automobile lubricant. Panhard Oil is the only cylinder oil made that will lubricate at all temperatures. It insures against pre-ignition, pounding, and other costly engine troubles which are commonly caused by poor cylinder oil carbonizing in the cylinders.

The new Sealed Can protects you against the substitution of an inferior oil—always see that the seal is not broken.

GEORGE A. HAWS, 84 Pine Street, New York City

NOTICE

CHANGE OF NAME

Rome-Turney Radiator Co., Rome, N. Y.

Formerly Long-Turney Mfg. Co.

Manufacturers of Rome Spiral Tube Radiators and Condensers.

We wish the trade to know that we have made extensive additions to our plant and with the added equipment our facilities are ample to take care of the RUSH orders and contracts that buyers may be ready to place. Any make of Radiator or Condenser repaired at once.

ROME-TURNEY RADIATOR CO., Rome, N. Y.

Digitized by Google

1. In controlling means for motor vehicles, the combination with the mixture inlet pipe and a throttle valve therein, of a starting crank for the engine and connections between the starting crank and the throttle valve whereby the latter is opened when the crank is moved to operative relation with the engine.

896,136. Recoil Compensator. Frederick J. Mellen and Burton A. Edwards, Beloit, Wis. Filed Nov. 14, 1907. Serial No. 402,217.

1. A recoil compensator of the character described, comprising a cylinder forming a chamber for a fluid medium, a solid partition secured in said chamber, a piston mounted to oscillate in said chamber, and formed with a passage extending therethrough, and a relatively small port also extending therethrough, a spring pressed check valve connected to said piston and adapted to close said passage, the piston being formed with a laterally projecting shaft extension extending out of the cylinder, said extension being formed with a bore intercepting said port, an operating arm secured to said extension, and a plug mounted in said bore and adapted to vary the size of the port, as and for the purpose set forth.

896,161. Change-Speed Device. David E. Ross, Brookston, Ind. Filed Nov. 6, 1905. Serial No. 286,015.

1. In a change speed device, a drive shaft, a driven shaft, a member carried by one of said shafts, said member having a grooved surface on its interior, a rotatable device secured to the other shaft within the said member, said device having projections for engaging with the grooves in said member, and means co-operating with said device for controlling the rotation thereof, whereby the relative speeds of the shafts are regulated, substantially as described.

896,195. Universal Joint. Fred H. Bogart, Hartford, Conn., assignor to Hartford Automobile Parts Company, Hartford, Conn., a Corporation of Connecticut. Filed Aug. 12, 1907. Serial No. 388,269.

1. A universal joint comprising an annular bearing plate having diametrically opposed bearings thereon, the ends of which are open, two forked members provided with hubs, the axes of which extent through the axis of said plate, each member having a swinging movement in two of said bearings on opposite sides of said plate, the planes of oscillation of said members being at right angles one to the other, and a two-part casing to inclose the bearing plate, and removably secured thereto.

896,254. Valve for Explosive Engines. Paul Schramm, Alameda, and Ira E. Wise, Wallace, Cal. Filed Oct. 12, 1905. Serial No. 282,440.

In an explosive engine, a valve chamber having a single opening communicating with the cylinder for the entrance of the explosive mixture and for the exhaust of the products of combustion, and provided with a single passage for the admission of a gaseous mixture and an exhaust passage communicating with said opening, and a single valve controlling said opening and passages, said valve comprising a head adapted to seat in the chamber opening, and a hollow cylindrical body portion depending from said head and connected therewith by a reduced portion arranged in one position of the valve to form a direct communication exteriorly of the valve between the cylindrical and exhaust passage, said reduced portion having ports therein adapted when the valve is moved to another position to establish a communication between the passage for the gaseous mixture and the cylinder through the body of the valve, and means for actuating said valve.

896,305. Device for Simultaneously Controling the Spark and Throttle of an Internal Combustion Engine. Hermann Lemp, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed June 30, 1906. Serial No. 324,195.

1. The combination with the spark control and the throttling mechanism of an internal combustion engine, of means for simultaneously regulating the advance and retardation of the spark with reference to the opening and closing of the throttle which changes the point of ignition at a rate proportionate to the sine of a given angle while varying the opening of the throttle at a rate proportionate to the versed sine of said angle.

896,314. Motor Vehicle. James C. McCurry, Texarkana, Tex. Filed Aug. 26, 1907. Serial No. 390,196.

1. A motor vehicle comprising a wagon having a box body, a fixed rear axle, and wheels mounted thereon, a movable front axle and wheels mounted thereon, an explosive engine mounted upon the rear end of the wagon body above the same and having the engine shaft projecting beyond the corresponding side of the wagon body, connections exterior to the wagon body from the engine shaft to the rear wheels for driving the latter, and steering means also exterior to the wagon body and connected to the front axle.

896,317. Clamp for Spacing the Bows of Vehicle Tops Apart. Frank L. Paxson, Philadelphia, Pa., assignor to Percy L. Neel, Philadelphia, Pa. Filed Oct. 11, 1907. Serial No. 397,014.

1. In a clamp for vehicle tops, two bars of rigid material correspondingly corrugated and pivotally and swivelly secured together, substantially as shown and described.

896,353. Filter. Allen A. Bowser, Fort Wayne, Ind., assignor to S. F. Bowser & Company, Fort Wayne, Ind., a Corporation of Indiana. Filed June 23, 1906. Serial No. 323,043.

In the device for the purpose described, the combination of a flat or shallow casing embodying two separable members, one having an inlet and the other an outlet formed in the edges thereof, the member having the inlet opening being also provided with a trap, a diaphragm composed of chamois skin dividing said casing into an inlet compartment and an outlet compartment and having its edges between said members, and spaced ribs formed along the inner face of one of the members in which the outlet is formed in the direction from the inlet to the outlet and bearing against said diaphragm, said members being secured together so that the inlet and outlet openings will be disposed diametrically opposite to each other and with the trap located between the inlet and the outlet openings.

Five to Twenty-Five Per Cent.
More Power with Remy Magneto

The 1909 Remy High Tension Magneto is built to withstand more neglect or abuse from oil, dirt or water than any other ignition system in the world.

It gives equally satisfactory results whether used by the most unskilled automobile driver or an experienced mechanician.

This is the magneto without brushes.

The Remy has a stationary winding. Its rotary inductor, taking the place of the ordinary wound armature, is a solid steel shaft with two forgings riveted to it.

It cannot give trouble. Thousands of Remy Magnetos are in use giving perfect results. Never has there been so universal a demand for one ignition system as for this.

We have sold on minimum specified deliveries, over 17,000 Magnetos for 1909 cars. More Remy's are already sold than All Other Makes Combined.

With automobile manufacturers continually striving to build better cars than their competitors, there is a reason for their adopting the Remy Magneto.

They know it is designed specially for American automobiles. The Remy is "fool-proof."

It differs particularly in these respects from the sensitively adjusted apparatus of our competitors.

It is designed by engineers who have been connected with automobile work since its beginning and embodies ideas suggested or approved by the largest automobile manufacturers.

Our factory was built specially for magneto manufacturing and is the largest of its kind in the world.

Some of the manufacturers using our magneto as the standard ignition equipment of their cars, follow:

Buick Motor Co.
Maxwell-Briscoe Motor Co.
Apperson Bros. Automobile Co.
Midland Motor Co.
Overland Automobile Co.
Cameron Car Co.
Kissel Motor Car Co.
Olds Motor Works.

Write us for illustration and full description of our new high tension magneto. We are building them in such large quantities that we can make you very attractive prices. We furnish fittings for attaching these magnetos to many of the old models of the different American cars and solicit your correspondence. Address Dept. 11.

REMY ELECTRIC CO., Anderson, Indiana

THE MARMON

"A Mechanical Masterpiece"

A Durable Car—A Car You Can Depend Upon and Be Proud of—And A Bargain

No other light car in the market, under $3,000, presents the actual value found in the Marmon "Thirty-two."

Weighing slightly less than 2,000 lbs., with 32-40 H.P., it has a world of speed and ability.

Built like a fine watch, each part is accurately wrought and harmonizes with all other parts. Parts interchangeable.

The workmanship, materials and design maintain the Marmon reputation for dependability and durability. The Marmons of 1903 are still giving splendid service.

The design appeals instantly to the man who knows good machinery.

A reading of the specifications will convince the experienced motorist that this "Thirty-two" equipment and Marmon construction considered, is the real bargain of the year.

Genuine Krupp and Chrome Nickel Steels used for important parts. Bosch magneto and battery—dual system. Three-point motor support. Straight line shaft drive. Rear axle and transmission in one unit. Marmon Oiling System. Large brakes. Hess-Bright ball bearings. Big tires (34x4 all around). Complete equipment.

Furnished as **Touring Car, Roadster, Four-Passenger Suburban with removable rear seat, or Limousine Town Car.**

We shall exhibit in New York only at Grand Central Palace Show, opening New Year's Eve.

The Marmon "Fifty"—A Superb Car

The fact that this car is a Marmon—one of the three or four really high-grade cars built in America—informs the experienced motorist as to its construction, ability, distinguished appearance and ease of motion.

In addition to this, a reading of the specifications will show that in hard, practical cash value, it is the superior of the most famous foreign cars or any other American car, at any price.

Marmon "Fifty" (with Seven-Passenger or Four-Passenger Body), $3750. Marmon "Forty-five" Roadster, $3500.

AUTOMOBILE FACTS

Will You Buy Dreams or Experience?

The car, proved to be in the best moderate-priced automobile, is

THE MAXWELL

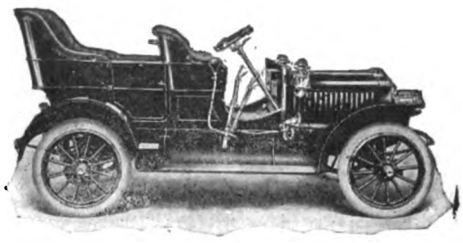
The greatest number of satisfied automobile users, now over 11,000,

THE MAXWELL

The greatest chain of automobile plants, New Castle with its ten acres of floor space—Tarrytown with its superb equipment—Pawtucket with its splendid facilities—forming the most important factor in the American automobile industry to-day, are devoted exclusively to manufacturing 9,000 per annum of

THE MAXWELL

Our output for the season of 1907-08 was over five million dollars—all represented by



THE MAXWELL

For our production the coming season the public will pay over eight million dollars, a business represented entirely by the sale and satisfactory use of

THE MAXWELL

In our experience we have seen automobile manufacturers come and go. We are proud of our success. It means that good design and superior qualities have been the recognized possession of

THE MAXWELL

THE FIVE-BEARING-MOTOR CAR
Maxwell Model D A, 4-Cylinder, 24-28 H. P., $1,750, Equipped.

The Maxwell-Briscoe Motor Company experiment on themselves, not on the public. Mr. J. D. Maxwell, instead of copying a lot of hodge-podge ideas, has made MAXWELL cars with the closest possible regard to the requirements of the average user. Therefore MAXWELL cars of all types represent the foremost utility American automobiles.

Our two-cylinder cars crowd the highways of the country; our four-cylinder cars are deservedly the most popular moderate-priced cars made.

In all our four-cylinders we use five-bearing crank shafts, as against only two or three in other cars.

The bodies of all of our cars are made of metal, costing more than twice as much as wooden bodies.

We use the unit construction, that is, make the engine and transmission case in one casting, not bolted together, **costing more** than the usual construction, and many times more substantial.

We have found that it has paid to make the best moderate-priced cars in the market. Not to try to make cars cheaper than any one else, but to make them better, and to sell them at a price commensurate with a just profit and a large output.

The Warner Instrument Co.
of Beloit, Wis.

Announce their Masterpiece—

The 1909 AUTO=METER

The illustration shows the form of the new instrument. The chaste simplicity and artistic beauty of the design is self-evident. It harmonizes perfectly with other dash equipment and gives tone to any car.

The Speed Recording mechanism is unchanged. It was perfection before. Improvement was impossible.

The Odometer is now of our own construction. Therefore, as simple, durable and dependable as the Auto-Meter itself. The figures are so large and distinct that they can be read from the seat.

The Season dial registers 100,000 miles. Other odometers register 10,000 miles only.

The Trip dial registers 1,000 miles. Other odometers register 100 miles only.

The Trip dial-set is simplified. A single turn of the button resets to zero.

Those who have used any kind of Speed Indicator will realize what these points mean to them.

The entire dial is illuminated by concealed electric bulb. The pressure of a button makes speed and distance plainly readable in the darkest night.

The Shaft Drive is now made simpler and stronger than ever before. We use special steel, heat treated, in its construction. This was really not required. We have seldom had shaft or other troubles not caused by carelessness or accident. We changed simply because modern methods had produced something better than we had used before.

The Auto-Meter is constructed throughout of the best materials procurable. It is made and put together by the same workmen who are engaged in making Chronometers and other expensive instruments of precision.

The tests and inspection of each instrument is so rigid that variations from absolute accuracy are only possible when there are variations in tire diameters. This amounts, on the average, to less than 100 feet to the mile.

For these reasons the Warner Auto-Meter has always been specified by those who can afford ***the best,*** and with whom anything short of absolute perfection and unfailing accuracy is of no use whatever.

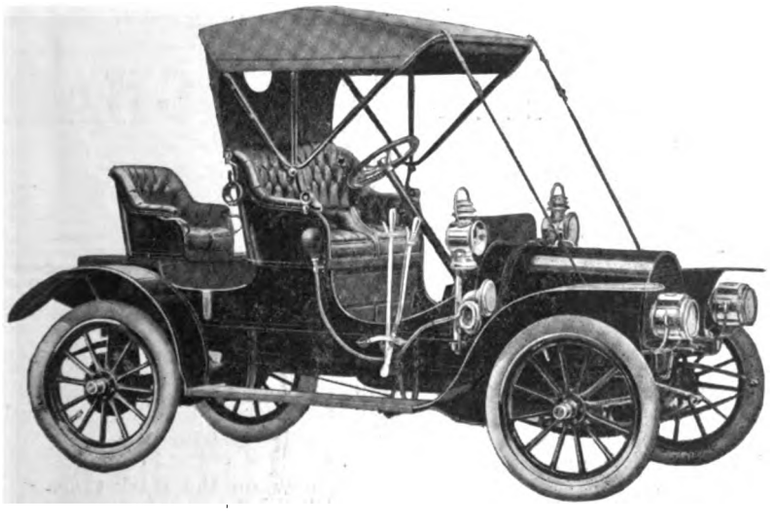
Franklin Model G Runabout

Why should a business or professional man buy any automobile that he cannot use every day in the year?

The Franklin Model G runabout is the highest type of automobile made. Like all Franklin automobiles it is built for what it has to do. It combines high power with strength and light weight. It has no water-cooling apparatus to carry, to freeze, to make trouble and expense. You can use Model G runabout every day in the year.

Model G runabout has a 4-cylinder, 18 H. P. long-stroke, air-cooled motor with fan; multiple disc-clutch, sliding gear transmission, shaft-drive, Bosch high-tension magneto. In quality it equals the largest and finest of Franklin touring cars.



It stands up for every kind of runabout service. In looks there is nothing better for anybody.

While air-cooling is greatly superior to water-cooling for any motor car, its advantage is especially realized in the runabout, which nine times in ten is used principally for business. It must be left standing out in storms and freezing weather.

W. C. Deming, M. D., in a recent issue of the *Horseless Age*, says: "I am a strong advocate of the four-cylinder, shaft-driven car, with air-cooled motor. There are no disadvantages in air-cooled cars that I know of as compared with water-cooled motors. Air-cooling must be efficient or the makers of cars with such motors could not continue in business and prosper. These motors are more economical of gasoline and not less of oil. Then why pay for radiator, pump, pipes and water jackets, carry the weight of these and of the water, and have the trouble of non-freezing solutions in winter or suffer the penalty of frost-wrecked cars?",

The Doctor is right. Why have unnecessary trouble?

The "Whats" and the Facts

Here are the "Whats" that confront the average man who contemplates the purchase of a motor car:

What will a car do for me?

The Premier will go through water, mud or sand, up hill and down dale over all kinds of roads, day in and day out. Its winning records in Glidden tours and all the endurance and reliability runs it has entered prove that. And all Premier owners testify to it.

What must I pay for it?

The Premier models range in price from $2,500 for the "Thirty" to $3,500 for the six cylinder "Forty-five." You can buy cars for less—and get a great deal less. You can buys cars for more—and get not a penny more of value.

What will it cost to operate it?

The Premier holds the official record for economy.

What will the repair bills be?

The Premier, taken apart and examined after a strenuous test run of 12,189 miles in 100 consecutive days, was officially pronounced able to do it over again without repairs. The same answer is found in all its great endurance runs. And Premier owners will tell you that its upkeep is insignificant.

What will be the length of its life?

We can show you any number of Premiers built during our first year, that have gone over 50,000 miles and are doing good service to-day.

What will it be worth next year?

For your own use it will be worth as much next year as it is to-day. If you want to sell your car, you have a car in which there are no radical changes from year to year and you can offer a car of proven value, a car so well known that you need no argument.

Dealers Who Sell
Stewart Speedometers
Have a Cinch

As one big dealer says, if you sell Stewart Speedometers it means

No speedometer troubles. No customers constantly coming in with broken shafts. No returned speedometers. No dissatisfied customers. Five times the volume of business

and it's a heap easier to hand him a five-year guaranteed Stewart Speedometer, at a reasonable price, than to spend an hour trying to convince him that he should pay three times as much for some other make, not nearly so good, and if you did sell him feel that you had stung one of your good customers.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, November 26, 1908. No. 9

OUTCOME OF TIRE CONFERENCE

American Motor Car Manufacturers Table Report—Chairman's Communication Brings Conspiracy Reply.

The situation growing out of the conferences of the tire manufacturing members of the Motor and Accessory Manufactuers, Inc., which had for its purpose the reduction of the list prices on tires appears to have caused some misunderstanding on the part of a number of those most concerned.

It will be recalled that at the now rather historic conference in Cleveland the chairman presented a revised tariff which he insisted be adopted, but which by a vote of 6 to 6 was not adopted, the meeting really coming to an end without substantial result. Despite the fact, the chairman appears to have been under the impression that conference committees which had been named by the Association of Licensed Automobile Manufacturers and the American Motor Car Manufacturers Association had been empowered to obligate the members of their respective organizations to abide by the action of the Cleveland meeting. To that end he forwarded a transcript of the minutes of the Cleveland meeting to the respective committees of the two outomobile manufacturers associations and called on them to instruct their agents to specify the tires the makers of which by their vote had inclined to the adoption of his schedule, which was supposed to represent the views of the A. L. A. M. and the A. M. C. M. A. The minutes showed just how each party to the Cleveland conference had voted and the use of them has left a train of bitterness.

What action was taken by the License Association has not been learned, but it just has become known that when their representatives rendered a report, the American Motor Car Manufacturers laid it on the table. It has become known also that the chairman of the latter association's committee wrote the chairman of the tire makers' conference that he (the tire chairman) was laboring under a misapprehension and that none could become a party to any procedure which so plainly suggested a conspiracy in restraint of trade. At last accounts, the matter rested there.

Mitchell to Operate Its First Branch.

A branch store and warehouse in Atlanta, Ga., has been decided upon by the Mitchell Motor Car Co., of Racine, Wis., where James M. Cram, of the home office will be in charge. The branch will be the distributing center for Georgia, North Carolina, South Carolina, Alabama, Louisiana and Florida, and will be the first established by the Mitchell company. Immediately following the Savannah automobile races. President William Mitchell Lewis and Sales Manager Gilson will visit Atlanta to select the location, following which they will visit New Orleans and Cuba.

Freight Rates Due for Big Boost.

Freight rates to California from the East are to be raised considerably on the first of the year, making an increase of from $25 to $40 each on big cars. From the New Eigland States the rate will be $8 per hundren pounds, and from the Middle States about $7 per hundred, as against the old rate of $6 per hundred. The dealers who will be affected by the raise are making the coming increase the basis for a vigorous campaign with prospective customers, urging them to buy at once to save freight costs.

Why Ford's Big Capitalization Increase.

In explanation of the Ford Motor Co.'s increase of capital from $100,000 to $2,000,000, the secretary of the company, James Couzens, says that the change is merely the transfer of $1,900,000 from the surplus to the capital stock. "We are rather proud of the record of the past five years," he continues. "We have been able to grow from comparative insignificance to a $2,000,000 concern, cash all paid up and no stock for sale."

APPROVES POPE REORGANIZATION

Court Overrules Objections and Authorizes Acceptance of $1,500,000 Offer—How New Company Will be Formed.

Despite the suspicions and opposition of Thomas H. O'Connor, the Jersey City holder of 100 shares of the Preferred stock, Vice-Chancellor Howell, sitting in the Chancery Court, Newark, N. J., on Thursday last, 19th inst., authorized the receivers of the Pope Mfg. Co., to accept the $1,500,000 offered for the Pope assets by the reorganization committee.

Steps already have been taken to secure the concurrence of the courts in Maryland, Massachusetts and Connecticut, in which latter state the reorganized company probably will be incorporated.

This favorable decision will permit the company quickly to terminate the receivership and to again stand on its own feet, as well as immediately to pay the creditors the fourth and final dividend of 25 per cent. The creditors thus will have received 100 cents on the dollar, and as the huge $22,500,000 capitalization will be reduced by the reorganization to $6,500,000, with $800,000 worth of 6 per cent. mortgage notes, the burden of the new company will be more in keeping with actual conditions.

Of the reduced capital, $4,000,000 will be common stock and $2,500,000 preferred stock. Holders of the outstanding preferred stock in the old company, amounting to $2,391,000, are to receive 75 per cent. of the par value of the old stock in new preferred stock and 83 per cent. of the par value of the old stock in new common stock. To effect this will require the exchange of $1,793,250 of the new preferred stock and $1,984,530 of the new common stock. Holders of the second preferred stock in the old company get 20 per cent. of the value of the old second preferred stock in new common stock. To redeem the $8,625,100 worth of this old second preferred that is outstand-

Digitized by Google

ing, will require $1,725,020 of the new common stock. The common stock in the old company will have no participating value in the new.

The owners of first and second preferred stock in the old company have deposited their stock with the reorganization committee, which will buy in the old company's assets and properties after the receivers have paid off all the outstanding indebtedness, when the new company will be formed and the new stock issued. For its services in financing the transaction and in agreeing to buy up the $800,000 worth of 6 per cent. mortgage notes which the new company is to issue, the underwriters are to take $500,000 worth of the preferred stock in the new company, and $90,450 in new common stock.

The distribution of the securities of the new company upon its starting business therefore will be as follows:

Syndicate for $800,000 cash	$500,000	$90,450
First preferred stock..	1,793,250	1,984,530
Second preferred stock.		1,725,020
Balance in treasury ...	206,750	200,000
Total	$2,500,000	$4,000,000

For the $800,000 in cash supplied by the syndicate there is the corresponding issue of $800,000 in notes, which must be added to obtain the total of security liabilities.

The preferred stock will be entitled to cumulative dividends at 6 per cent. from August 1, 1908, and no dividends on the common stock will be made until all back dividends on the preferred are paid up. Similarly no dividends on any of the stock will be paid until the mortgage notes are paid.

In ruling against the objecting O'Connor and in favor of the receivers, Vice-Chancellor Howell after a brief resume of antecedent circumstances, proceeded to point out the risks involved in the carrying on of such a business from which he drew the conclusion that investors would probably not consider any proposition looking to the taking the plants as a permanent investment.

These circumstances, the vice-chancellor holds, limit the persons who would be likely to entertain the idea of purchasing the property to an extremely small number, and go almost to the extent of demonstrating that the present owners of the properties, the stockholders, are not only the natural and logical bidders, but must be almost the only bidders.

The vice-chancellor adverts also to the fact that the court is always anxious to avoid having any business operated under its control longer than is absolutely necessary to pay the creditors and preserve the property from destruction, and always looks with favor upon business arrangements whose object is to relieve the court from that responsibility. The vice-chancellor goes on to say:

"I think it appears by the testimony that the property which the reorganization committee desires to purchase is worth, as it stands, as a going business, as between a willing purchaser and a willing vendor, somewhat more than the sum offered by the committee, but it is apparent that the value of the property is not sufficient to pay the whole of the first preferred stock, which I understand to be preferred to the other issues, both as to capital and to dividends, and that for the purposes of this motion we may disregard the second preferred stock and the common stock. The committee reorganizations represent all the outstanding first preferred stock except 245 shares, 100 shares of which belong to the objector.

"The discrepancy may be affected by the business considerations above stated, by the financial conditions of the country, by the financial conditions of the automobile and bicycle trade, or by the dozen other matters which enter into a large business.

"Again, the total outstanding first preferred stock of the Pope Mfg. Co. is $2,345,500. The objector's holdings amount to 100 shares of the actual par value of $10,000. While the holder of a single share has the same legal right to object to this sale that he would have if he held a great majority of the stock, yet he does not appeal to the court with as great favor, for the reason that the very great majority of his fellow-stockholders have decided upon the proposition with a judgment very different from his. And particularly is this true in this case in which the objector does not go to the trouble of giving the court any information concerning the facts from his own standpoint.

"The case must, therefore, rest on the petition and testimony adduced on behalf of the receivers. I will advise an order that the receivers be permitted to accept the offer."

Iowa Concern to Specialize Farm Vehicles.

The Bertschy Motor Co., of Council Bluffs, Ia., has been organized to make combination traction engines and pleasure cars, and also freight trucks for city use, with automobile fire engines as a side line. The leader will be a machine for farm use, which after hauling gang plows in the fields or loads of grain to market on week days, can on Sunday be converted to a vehicle to carry the family to church. The company also plans to a rebuilding and repairing business. It is incorporated nuder Nevada laws, and is capitalized at $50,000, of which $20,000 is said to have been subscribed for already, chiefly by members of the Council Bluffs Commercial Club. The officers chosen are: T. R. Children, president; A. J. P. Bertschy, vice-president and general manager; George S. Wright, secretary; and Ernest E. Hart, treasurer.

Buyer Found for Eisenhuth Plant.

Bond holders of the defunct Eisenhuth Horseless Vehicle Co., of Middletown, Conn., have accepted a proposition to sell to the Silent Typewriter Co., of New York City, at 75 per cent. of the par value of their holdings. The total of outstanding bonds is $110,000, and at the meeting in Middletown on the 20th inst., 22 of the bond holders, representing $85,000, signed the agreement, with the provision that all of the owners will sell at the same price. The purchasing company is given until next March to take up its option.

Injunction Saves a Western Factory.

An injunction against dismantling the Owen Thomas Motor Co.'s plant at Janesville, Wis., was obtained by Owen Thomas recently in bare time to prevent the buildings being torn down by workmen employed by the C. & N. W. railroad. The railroad company had leased the building to the Thomas company for a plant, for a year, but as the latter concern did not appear very active, the railway employes tearing down the other buildings in the yard were directed to include the Thomas plant.

To Handle Federal Tires in New England.

William P. Cronin, formerly with the Diamond Rubber Co., has become president of the Standard Tire & Rubber Co., of Boston, Mass., with offices and salesrooms at 102 Portland street. James S. Waddell, long in the rubber business, assumes the duties of treasurer. The concern will handle Federal tires, and will shortly open a branch in the Boston up-town automobile district.

Three New Taxicab Companies Organized.

Three new taximeter cab companies entered the lists last week and despite the asserted legal claim of a New York company to the exclusive use of the word "taxicab," each of the new comers includes that term in its title. They are the Citizens Taxicab Co., Cleveland, Ohio; the Reading Taxicab Co., Reading, Pa., and the Lackawanna Automobile & Taxicab Co., Scranton, Pa.

Speed Changing Pulley Moves to Anderson.

The Speed Changing Pulley Co., formerly of Indianapolis, has taken possession of its new factory at Anderson, Ind. The buildings have 60,000 square feet of floor space, and will be chiefly devoted to the manufacture of the chassis for the Studebaker motor buggy.

Clifton Sails for European Visit.

Charles Clifton, of the George N. Pierce Co., and president of the Association of Licensed Automobile Manufacturers, this week sailed for Europe. He will be absent about one month, and will, of course, visit the Paris show.

Typhoid Lays Hold of Wetzel.

Thomas J. Wetzel, the well known New York sales agent, is seriously ill with typhoid fever. On Tuesday last he was removed to a private hospital and was doing as well as could be expected.

IN THE RETAIL WORLD.

The Monarch Motor Car Co., has opened a branch at 24-26 Eighth street, N., Minneapolis, Minn. J. H. Kersten is in charge.

The Lewiston Automobile Co., of Lewiston, Mont., is building a large stone garage. The company plans to handle the Franklin.

West & Vaiel, of Springfield, Ill., have opened a garage next their electric light plant. It will have a fully equipped repair department.

H. Perrin & Son, carriage dealers in Mankato, Minn., have embarked in the automobile business. They will handle the Maxwell.

E. D. Carlough, of Paterson, N. J., has moved to his new building at 175 Van Houten street. It comprises a show room and repair shop for Franklin cars.

The Klafferthere Garage, in Chihuahua, Mexico, was destroyed by fire on the 10th inst. The total loss is close to $750,000, including 22 cars belonging to patrons.

Beloit, Wis., is to have another automobile agency. It will be known as C. Mattison & Son, the senior member being the owner of another established local business.

Detroit's already large agency list has had another addition in the C. B. Fear Automobile Co. The concern has taken a store at 844 Woodward avenue to handle the Gyroscope.

Urling & Co., of Pittsburg, Pa., are removing from 939 North Wegley avenue to 6112 Broad street. In addition to handling the Corbin, the firm will manufacture wind shields.

John Hoopes, of Westchester, Pa., has sold his business to Harry J. Walter. The garage and repair shop are being moved to the Mercer building on West Miner street.

W. L. Tedford, formerly in the commission business, has sold out and will start an automobile salesroom and garage in Little Rock, Ark. He is planning a two-story brick building.

Cowan Rogers has leased the brick garage which is being built at Gay street and main avenue, in Knoxville, Tenn. The building will be ready for occupancy on the first of the year.

The Franklin Automobile Co., of Boston, Mass., has removed its repair and garage departments from 61 Wareham street to 31 Irvington street. The change gives a large increase in space.

The Standard Motor Co., 616-618 North Broad street, is the latest addition to Philadelphia's motor colony. William P. David, formerly a member of the Kelsey Motor Car Co., is the proprietor.

The Eagle Automobile Co., of Avondale, near Cincinnati, O., is building a garage at 3139 Reading road. The structure will be of concrete blocks and the foundations will be strong enough for six stories if they are required.

S. G. Chapman has resigned as president and general manager of the Consolidated Motor Car Co., of San Francisco, Cal., agents for Pope and Franklin cars. He is succeeded by Harry A. Weihe.

All the property and effects of the bankrupt Charleston Motor Co., of Charleston, S. C., were sold at auction on the 30th ult. The trustee in bankruptcy, Walter C. Finger, is preparing his final report.

James F. Patton, for five years superintendent of the F. B. Stearns factory in Cleveland, O., has started in business for himself. He has opened an automobile repair shop at 4509 Euclid avenue.

The Weed Garage, 233 Ontario street, Toledo, O., has been sold to August B. Uhl, who has been its superintendent for two years. It will be conducted under the name of The Standard Garage hereafter.

Robert R. Ashwell, of Hartford, Conn., has opened his new garage at 347-349 Trumbull street. It contains 31,000 square feet of floor space and accommodates 250 cars. The show rooms feature the Franklin.

The Sears-Nattinger Automobile Co., of Des Moines, Ia., has changed its name to the Sears Automobile Co. The change is due to the death of Nattinger, who was killed in an automobile accident recently.

Quint Bradshaw and Henry Conn have leased the lower room of the Odd Fellows building on Depot street, La Harpe, Ill., for an automobile salesroom and garage. Adequate repairing facilities are being installed.

Gotfredson Bros., well known merchants of Green Bay, Wis., have decided to embark in the automobile business. A building on Jefferson street, at the corner of Main street, has been selected for their salesroom and garage.

A new agency is being organized in Waterbury, Conn., to handle Pope and E-M-F. cars. Its backers include Charles S. Woodward, Ira F. Bachelder and Henry F. Stackman, prominent real estate men, with offices at 21 East Main street.

The Kansas Auto & Supply Co., 526 Quincy street, Topeka, Kan., has been sold by its proprietor, W. E. Mallory, to A. C. Longren and Claus J. Carlson. Under the new ownership the concern will be known as the Kansas Motor Car Co.

C. W. Lindsay and H. A. Wetmore have formed a partnership for the sale of Thomas cars in Sioux City, Ia., where they will establish a garage. Their territory includes western Iowa, eastern Nebraska and southern Minnesota and South Dakota.

Eddie Bald, once famous in bicycling and subsequently as an automobile race driver, has resigned as sales manager for the Crescent Automobile Co., of Pittsburg, Pa. He has taken the sales management of the Mutual Motor Car Co., of the same city.

Frederick F. Goodman, Inc., automobile garage at 51-55 West Ninety-third street, New York City, has assigned. A petition in bankruptcy has also been filed against the concern. Judge Hough appointed Hamilton Holt as receiver. The assets are estimated at $5,000.

The Auto Livery Co. has been organized in New Orleans, La., to do a general automobile business. The concern is backed by Ginder Abbott and Palmer Abbott, who have had considerable previous experience locally, together with E. J. Hewling and Joseph Woodward.

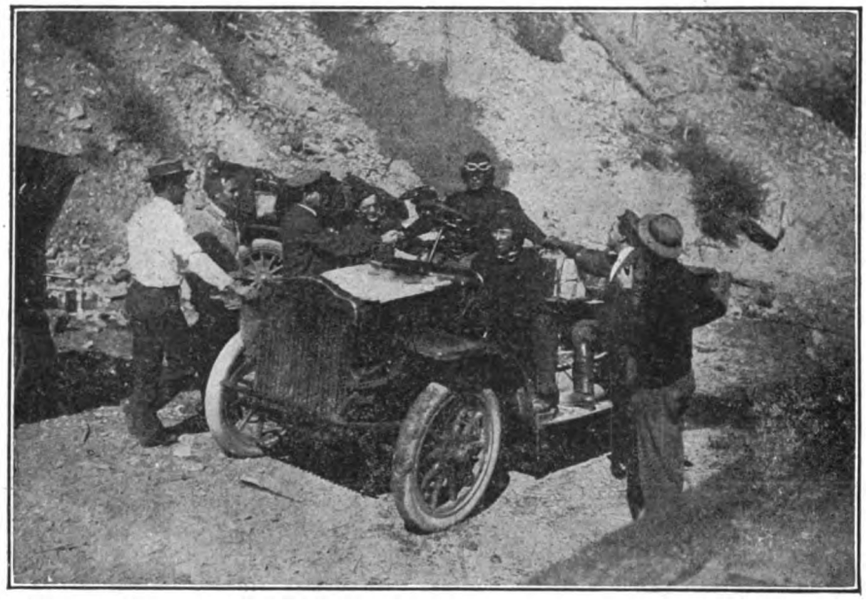
George Tebeau, baseball magnate and owner of the Kansas City team, has opened an automobile establishment in Kansas City, Mo. It is located at 1716 Grand avenue and has the agency for the Stearns. A large garage is being added, which will be ready by the first of the year.

The Haynes Automobile Co., of Minneapolis, Minn., is to resume business, carrying the agency for three well known cars in a large northwest territory. The company sold out a year ago, but has assumed its old name and will be under the ownership of Harvey S. Haynes, as before.

In Philadelphia the Maxwell-Briscoe Motor Co. has leased the Jeffery building, 207-209 North Broad street. The building will house both the wholesale distribution organization and the local agency, which latter will be called the Longstreth Motor Car Co., instead of the Kelsey Motor Car Co., as formerly.

Wichita, Kan., is to have its seventh automobile agency in the Star Automobile Co., which has been formed by Hugh E. Roberts, E. N. McGregor and A. C. Houston. The company, which is erecting a $16,000 building, will distribute the Overland in several states. J. J. Sprague has been appointed manager.

The interests of A. E. Howe in the Howe Motor Car Co., 51-53 Bank street, Newark, N. J., have been purchased by M. F. O'Neill. While the present location will be retained, the name of the concern will be canged to the O'Neill Motor Car Co. Howe will devote himself exclusively to his automobile business in Paterson, N. J.



A branch of the Olds is being opened in Louisville, Ky. The local sales will be in charge of Henry C. Colgan, while Frank Glenn, Jr., will be general manager for the territory, including Kentucky, Tennessee, Alabama and Arkansas. A Lexington (Ky.) agency has been placed with Archie Hamilton, who has located next the Phoenix hotel.

To handle Jewel cars in New York City a new company has been formed, which will be called the Jewel Motor Car Co. of New York. A location has been taken at 1662 Broadway where the full line of Jewel models, made by the Forest City Motor Car Co., of Massillon, O., will be shown. J. P. Stoltz, of 420 West Twenty-third street, is the proprietor.

WHITE WINS

Los Angeles to Phoenix Road Race

A brilliant victory was scored by the White Steamer in the recent stock-car race through the mountains and over the desert from Los Angeles, California, to Phoenix, Arizona. Once again the White demonstrated that in a stock-car competition and over roads such as exist in most parts of the country it is faster than any other type of machine. Such a contest as the Los Angeles-Phoenix race is far more significant than a race between specially built cars over specially selected and carefully prepared highways. This latest White victory indicates to the purchaser just what kind of service he may expect from the type of car which he can buy and over roads such as he will have to cover.

The White is the fastest car on give-and-take roads, not because it has the highest-powered engine, but because it delivers at the rear wheels a larger percentage of the power of the engine than any other type. Furthermore, that power is available under all conditions, whether running fast or slow, and no time is lost in shifting gears or in waiting for the engine to "pick up speed." In other words, under ordinary road conditions, the flexibility of the White engine will do what great power in other types of engines cannot do.

Write for circular describing the 1909 models.

The Standardization of Control.

Frequent observation has been made of the nonchalant way in which many designers arrange the accommodation for the driver of the car without due deference to his bodily comfort or to the safety which is supposed to lie in the facility with which he is able to operate the machine. The general crudity of the arrangements for controlling the vehicle is disappearing with time and experience, to be sure, but it is manifest even yet to a degree which is far from comforting. Just why it should be necessary to arrange gear levers so short as to require the driver to lean far from his seat in effecting some of the changes, for instance, or why the pedal foot plates should be elevated so far that the heel of the operator must be kept off the foot board at all times when the toe is resting on the plate, is difficult to understand. The inconvenience which is manifest to an astonishing degree is all the more to be wondered at since the subject already has attracted so much attention, and has been so successfully wrought out in a large number of cases.

A point of noteworthy importance in this connection is that the different methods of control prevailing on various cars are tremendously confusing to the operator who is called upon to change from one to another. This objection might not be held valid were it not that many owners possess two or more machines so widely differing in methods of control that to change repeatedly from one to another may constitute a source of real danger. Furthermore, were there any singular merit in the many systems which differ only in smaller details, there would be less objection to the variety. As it is, little aside from the individual taste of the designer appears to excuse many points of difference. Certainly if absolute standardization were welcome anywhere about the machine, it would be in the vicinity of the driver's seat.

Efforts at standardization in this particular thus far have been confined to the size of the steering wheel and its position with regard to the seat, while the height of the seat also has been brought down to narrow limits. The absolute position of the levers and pedals however, the length of throw, and amount of resistance to movement, still remain at the discretion of the builder. Therein lie considerable differences which, to the skilled and cautious driver are of small account, but which to the unskilled driver, particularly if compelled to assume the control of an unfamiliar vehicle on short notice constitute ground for considerable embarrassment, if not actual peril. Generally speaking there would be little to sacrifice if all manufacturers were to agree upon a standardized control, and much to gain. The trend which is guided by imitation of successful achievements leads in this direction sometimes, but frequently is limited rather to appearance and mechanical detail than to the element of the driver's comfort. The subject is an easy one to discuss and as it depends upon no complex or befogging theories, should prove an easy movement to encourage successfully.

While the establishment of the automobile has been accomplished speedily in the appreciation of the public and its utility has been granted open and gratifying recognition, it is evident that its real position remains to be defined properly. This is particularly evdent in the framing of legislative enactments, though the spirit there shown is probably but an index of a feeling which is current pretty generally. Automobile laws are framed for the restriction of automobiles—not of automobilists; accidents are ascribed to the cars, not to their drivers; even where credit is given for a remarkable or unusual performance, it is to the machine rather than to the human agency which guides it. When the definition of the motor vehicle as a purely inanimate and passive utensile in the hands of the operator is properly fixed, it may become a simpler matter to adjust questions pertaining to its use by the public and to eliminate the abuses which do so much harm to the cause.

Private owners who are inclined to rebel at the amount of expense involved in the pursuit of motoring should be taught the judicious treatment of the tire problem. Tire upkeep is, as it always has been, one of the most important items in the grand total of car maintenance. That it is usually much higher than really is necessary, however, is almost a foregone conclusion. If the amateur driver and mechanic could only be taught to keep his tires inflated to the proper pressure at all times, and to have recourse to vulcanization of all small cuts and tears as soon as they appear, there would be far less complaint of the short life of shoes and tubes, which after all, are very little to blame for most tire troubles.

It is crystalizing an expression of contumely to perpetuate the term "toy tonneau." The motor car is frequently referred to as a plaything of the rich, but only in derision, and to endorse the sentiment of its inutility is not alone unseemly, but belittling to the machine. "Baby tonneaus" are bad enough in all conscience from the point of view of discomfort and the danger of being cast out bodily at the first sharp turn in the road. But to label them thus with their shortcomings is to court the inevitable end of a passing fad.

When a large, old and long respected company, such as the Pope Mfg. Co., is able to lift a heavy burden and to wholesomely emerge from serious trouble, the industry with which it is identified and to which it has been a credit scarcely will withhold felicitations. That the company paid 100 cents on the dollar will add to the sincerity of the felicitations.

THE WEEK'S INCORPORATIONS.

New York City, N. Y.—General Taxameter Co., under New York laws. Increase of capital from $5,000 to $320,000.

Cleveland, O.—Wright Auto Horn Co., under Ohio laws, with $35,000 capital. Corporators—C. M. Hartley and others.

Auburn, Me.—Darling Automobile Co., under Maine laws, with $10,000 capital. Corporators—G. R. Hunnewell, president; V. S. Darling, treasurer.

Chicago, Ill.—Standard Automobile Station, under Illinois laws, with $2,500 capital. Corporators—C. S. Everett, Joseph Seiler and L. G. Roach.

Chicago, Ill.—Woods Electric Garage, under Illinois laws, with $2,500 capital. Corporators—A. L. Schwartz, George H. Foster and John F. Rosen.

Waterloo, Ia.—Moore Auto Co., under Iowa laws, with $10,000 capital. Corporators—D. J. Moore, president; William Galloway, secretary and treasurer.

Sandy Hill, N. Y.—Adirondack Motor Car Co., The, under New York laws, with $10,000 capital. Corporators—M. O. Kasson, George N. Ney and G. H. Ingalsbe.

New York City, N. Y.—Ralph K. Mulford Co., under New York laws, with $1,000 capital. Corporators—Howard O. Lente, Ralph K. Mulford and Michael J. Driscoll.

Chicago, Ill.—Kissel Motor Co., under Illinois laws, with $10,000 capital; to deal in automobiles. Corporators—H. Darnstetter, W. A. Johnston and E. P. Hornack.

Minneapolis, Minn.—Mich Automobile Co., under Minnesota laws, with $10,000 capital. Corporators—William M. Wright, Florence Wright, Harry J. Mich, and Jean Mich.

Madison, Wis.—Madison Automobile Co., under Minnesota laws, with $10,000 capital. Corporators—Norwood J. Hitz, Abraham J. G. Forry, Carlisle Strader and Thomas B. McGregor.

Chicago, Ill.—International Automobile Co., under Illinois laws, with $20,000 capital; to manufacture and deal in automobiles. Corporators—E. C. Haynes, C. E. Hall and J. W. McDaniel.

Chicago, Ill.—Great Central Electric Co., under Illinois laws, with $25,000 capital; to manufacture and deal in automobiles. Corporators—John S. Crowell, J. E. Haschke and F. L. Harford.

Lóganspirt, Ind.—Bendix Automobile Co., under Indiana laws, with $200,000 capital. Corporators—Vincent Bendix, H. Clay Calhoun, Frederick Patterson, W. S. Resor and J. H. Behrens.

Scranton, Pa.—Lackwanna Automobile and Taxicab Co., under Pennsylvania laws, with $10,000 capital. Corporators—William Conrad, Edward Conrad, Otto R. Conrad and Charles C. Conrad.

Cambridge, Mass.—Norris Motor Car Co., under Massachusetts laws, with $50,000 capital; to manufacture and deal in automobiles and accessories. Corporators—Wesley S. Young, president, et al.

Detroit, Mich.—Herreshoff Motor Co., under Michigan laws, with $90,000 capital. Corporators—Charles M. Herreshoff, Louis Mendelsohn and Carl Reese, of Detroit; James A. Marr, Bridgeport, Conn.

Pittsburg, Pa.—Athletic & Auto Club of Allegheny County, State of Pennsylvania, The, under Delaware laws, with $25,000 capital. Corporators—G. S. Merriman, J. M. Ward, W. W. Jarvis, Pittsburg, Pa.

New Haven, Conn.—Baker Mfg. Co., under Connecticut laws, with $5,000 capital, $1,000 paid in; to manufacture spark plugs and accessories. Corporators—Otto L. Hemming, Gustave F. Hemming and Max L. Baker.

Buffalo, N. Y.—E. E. Denniston Co., under New York laws, with $30,000 capital; automobile accessories. Corporators—William G. Denniston, Worcester, Mass.; Edward E. Denniston and Clyde R. Sikes, 184 West Mohawk street, Buffalo.

Elmira, N. Y.—Thomas Resilient Wheel Co., under New York laws, with $25,000 capital; to manufacture wheels and other appliances. Corporators—G. H. Thomas, G. A. Davies, C. R. Murphy, C. F. Thompson, T. W. Cleveland, Elmira, N. Y.

New Haven, Conn.—Wheeler & Wuestefeld Co., The, under Connecticut laws, with $4,500 capital; to deal in automobiles. Corporators—George B. Wuestefeld and Dorothea Wuestefeld, of New Haven; Cyrus E. Wheeler, of Hartford, Conn.

New York City, N. Y.—Post Motor Co., under New York laws, with $30,000 capital. Corporators—George W. Post, Jr., Bronxville, Westchester county; John N. Blair, 27 Washington square, north; Louis F. Staar, 471 Ocean avenue, Brooklyn.

New York City, N. Y.—Greater New York & Suburban Transportation Co., under New York laws, with $25,000 capital; to build taximeter motor vehicles, engines, etc. Corporators—H. Lauterbach, C. E. Volz, Brooklyn, N. Y.; C. A. Conner, New York City, N. Y.

East Orange, N. J.—Brick Church Automobile Co., The, under New Jersey laws, with $100,000 capital; to manufacture and repair automobiles and motorcycles and conduct garage. Corporators—L. Burr Manning, John B. Todd and Melvin O. C. Hull.

New York City, N. Y.—Aero Tire and Supply Co., under New York laws, with $1,500 capital. Corporators—Michael O'Connor, 738 Seventh avenue; Lothair I. Siegel, 426 Central Park West, New York City, N. Y.; William R. Coleman, 147 Pierrepont street, Brooklyn, N. Y.

New York City, N. Y.—Cameron Motor Co., under New York laws, with $150,000 capital; to manufacture motors, engines, cars carriages, vehicles, etc. Corporators—E. D. Alexander, New Brighton, N. Y.; R. R. Logan, New York City, N. Y.; F. Hildebrandt, Tompkinsville, N. Y.

Council Bluffs, Ia.—Bertschy Motor Co., The, under Nevada laws, with $50,000 capital, $20,000 paid in; to manufacture combination traction engines and pleasure cars. Officers—T. R. Children, president; A. J. P. Bertschy, vice-president, and general manager; George S. Wright, secretary and Ernest E. Hart, treasurer.

COMING EVENTS

November 26, Savannah, Ga.—Automobile Club of America's 400 miles race.

November 26 and 29, Bakersfield, Cal.—Track meets.

November 26, Los Angeles, Cal.—Automobile Dealers of Southern California annual hill climb.

November 26, Denver, Col.—Colorado Industrial Exposition Association's race meet. Overland Park track.

November 28, Providence, R. I.—Rhode Island Automobile Club's hill climbing contest, "Dolly Cole" Hill.

December 5, Long Island Motor Parkway—Speed trials against time, auspices of the Long Island Motor Parkway, Inc.

December 12, Denver, Col.—Denver Motor Club's hill climbing contest, Lookout Mountain.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 22, Ceveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

OLYMPIA UNVEILS NEW MODELS

London's Great Show Anticipates Revelations of the Paris Salon—Preponderance of Light Powered Cars.

Olympia, London's first and only orthodox show, opened its doors on Friday, 13th inst., and closed on Saturday last. As the first show of general significance this fall, and moreover, being sufficiently near to the great Continental centers of automobile manufacture to catch the drift of the times, it attracted more attention in the industry than the exhibitors at the later Paris Salon will admit that it merited. In fact as an excuse for the unveiling of several of the small cars which just now are occupying the attention of many of the makers, both British and Continental, it furnished an authentic endorsement to the current impression that the eyes of the foreign industry are pretty largely turned toward the machine which is easy to build and sell in considerable numbers rather than toward its former favorites of more elaborate construction and higher price.

GENERAL VIEW OF THE OLYMPIA SHOW IN LONDON

In the various exhibits, one feature hitherto of great prominence was lacking. Racing cars were barred—out of deference to the wishes of His Majesty, the King, it was said—and as the prohibition not alone eliminated the immense racing cars built for the big foreign contests, but "all cars designed for competitive purposes," the character of the show was somewhat unusual. One hundred and nine makers and agents staged cars of one type or another, and though racing machines were barred, the effect of the past racing season was manifest not a little in the details of the numerous "four-inch" cars, the engines of which were designed in accordance with the conditions governing the Isle of Man trials of last summer. In this connection also, the growing use of the long stroke motor—bred directly of racing definitions—was very marked. This was most evident in the case of the light cars of two and four cylinders, corresponding in price and other specifications to the moderate priced cars which are coming into so great prominence on this side of the Atlantic. Other "features" of the show included several new types of motor, several new six-cylinder models, the "elimination of the gearbox" in at least one case, increases in the number of shaft driven cars—and the usual surfeit of "detailed improvement."

In the staging of the show, no definite plan of decoration on a uniform scale was adopted, though the subject has been broached more than once and gravely discussed. The conservative and hit-or-miss method of permitting each exhibitor to fix up his own stand according to the extent of his fancy and pocket book resulted in a scene familiar to the show goer of several years ago in this country or to the frequenter of the French Salons. Being out of the atmosphere of Parisian extravagance, however, it lacked both the brilliancy and charm of the Continental shows.

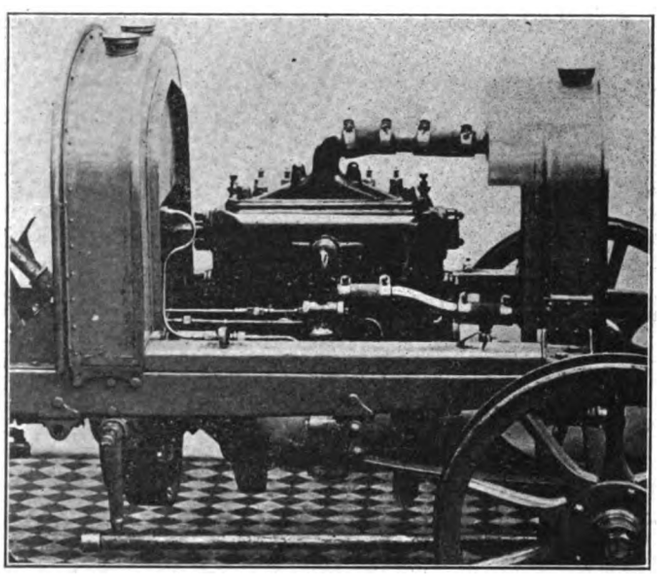
Over 80 of the cars on view were exhibited as new models. Of these, three—the White, Cadillac and Buick—were of American origin. Others which attracted particular attention were the new Daimler models—five of the six types having the Silent Knight engine—the 38 horsepower Minerva, similarly equipped; the new Napier models, of two, four and six cylinders; and the "Two-Stroke," wherein a rather novel form of two-cycle motor is placed in an inclined position and with its air-cooled cylinder head and water-jacketed cylinders appears to embody even more novelty than in all probability it is entitled to. Its form certainly is unique.

Considerable attention was attracted by the latest form of Sheffield-Simplex—a "car without a gear box," just brought out. As its name implies, it is designed for continuous service on the direct drive. Despite the absence of the gearset, however, what might be considered by carping critics as a practical equivalent of that device is contained in a small adjunct to the transmission which contains a low speed forward gear and a reverse. The car is of the six-cylinder type, having a motor of 4½ inches "square" cylinder measurements and has a driving ratio of 3.1 to 1 on the direct connection. The reverse and low speed arrangements give a ratio of 6.15 to 1. It is claimed that the elimination of the gearbox—so-called—results in a reduction of the number of transmission parts by no less than 150.

Of the small cars, quite the leading feature from the point of view of tendencies in the industry, several proved to be forecasts of what the later Salon holds in store. Of these were the new 10 horsepower Mors, the 15 horse Mercedes, 10 Panhard, 12

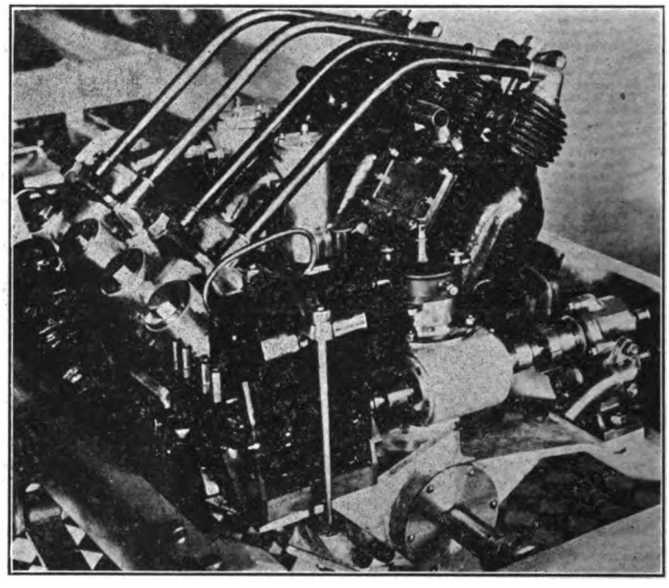
Digitized by Google

Hotchkiss, 10 horse De Dion, 10 horse Delage, and 10 horse Delaunay-Belleville. England's quota in this class included the new Napier, modestly rated at 15 horsepower, and boasting a worm drive among other interesting points; the Austin of the same power, and the 12 horse Talbot. Two cylinder models, suitable for either runabout or taximeter service were shown by the makers of the Delaunay-Belleville, Renault, Darracq, Charron and Napier cars.



As for the tendencies apparent in detail, it was noticeable among other things that the popularity of the block type of motor is increasing among the makers. Several of the smaller types of car have these motors in remarkably condensed form. The Delage motor is a good example of this, though by no means the most complete in its class. Block castings, however, seems to be confined largely to motors of the popular low powered type. Larger motors, of course, have the twin form of casting to a prominent degree. Where two or more models are produced by the same maker in powers not too widely differentiated, the difference is frequently obtained by altering the bore and retaining the same stroke, one of the two thus obtaining the newly popular long stroke. A trend, which may be supposed to follow in the wake of the long stroke motor, is that looking toward the use of larger valves, many of which already are in evidence.

Improvements in detailed construction of the motors appear in the arrangements for mechanical force-feed lubricating systems for the cylinders and crank shaft bearings; the displacement of exhaust pressure for fuel feed systems in favor of automatic air-pumps; complete, double ignition installations in increased numbers; and a growth in the use of interlocking hand and foot control located either on the foot board or steering wheel. Ball bearings are practically universal on the better grades of car, whether large or small, and appear at practically important points except the crank shaft and the big ends of the connecting rods. The "gate" change gear system is prevalent, though frequently in crude form, and the almost universal type of change gear system is prevalent, though frequently in crude form, and the almost universal type of change gear is the sliding pinion.



A marked impression gained from a general inspection of the vehicles as a whole was that of the rapid growth in the use of the closed car, particularly in the light landaulette and cab patterns. Covered bodies of all types were very numerous, and upon the larger examples, wonderfully fine workmanship and ingenuity of design were manifest. The bulk of the display of light cabs was at once impressive and suggestive. Prices, as a rule, revealed small reductions, considering the general run of vehicles. A few exceptions to the rule of constancy, however, were to be found in instances where makers had seen fit to make a small advance on former prices.

The accessory section was replete with the usual impossible array of new and old novelties, providing at once the most bewildering and fascinating section of the show. Among the larger components to be found, was the Allen-Liversidge front wheel braking system, described in last week's Motor World. Of the promising novelties on view, the field of ignition furnished the better part. As is always the case with an early show, however, the complete cars furnished so much material for study as to preclude the possibility of examining them in detail.

Among the novelties of the British show season is a collapsible funnel intended for use in filling the fuel tank and radiator when touring. It is formed of successive tapering rings of thin sheet metal much the same as the ordinary folding drinking cup, except that at the bottom it is provided with a neck of relatively small diameter intended to fit into the filling aperture. When collapsed it will go into the tool kit very nicely.

THE COMPACT 4-CYLINDER DELAGE

ODD CONSTRUCTION OF THE "TWO-STROKE" MOTOR

More Taxicabs for San Francisco.

San Francisco, Cal., has taken to taximeter cabs with such avidity that a number of companies for their operation have recently been formed. Among the latest of these is a $300,000 concern headed by Fay C. Beal, president and general manager. The directors include C. M. Beal, George P. Fuller, L. W. Harris, R. J. Marx, Frank Hooper and Clarence R. Ward. It is also rumored that the United Carriage Co., at present operating the largest hack and transfer system in the city is planning to install taximeter motor cabs.

Birmingham to Buy Motor Trucks.

A delivery and transfer business which will use motor cars and trucks instead of horses has been started in Birmingham, Ala., and will be known as the Auto Livery Co The officers and directors of the company are H. T. Shoup, president; N. O. Tyler, vice-president; H. Lee Brown, treasurer, and A. J. Morgan, secretary.

Lindsley to Locate in Seymour.

The Lindsley Motor Car Co., Dowagiac, Mich., is reported to have let contracts for the construction of a factory building in Seymour, Ind. When it is completed it is the purpose of the Lindsley company to remove to Seymour.

Automobile dealers of Omaha and Council Bluffs have decided to hold a show in Omaha, Neb., from March 1 to 6, inclusive. The exhibition will be given in the Auditorium.

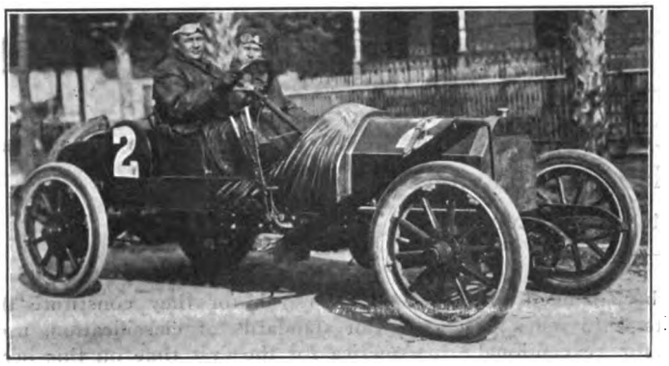
SAVANNAH ON TIPTOE FOR GREAT SPEED BATTLE

Even Churches Yield to Interest in Grand Prize Event and Hold No Thanksgiving Services—Contest to be a Race of Drivers—Strang Fastest in Practice and Hemery the Favorite—Mighty Influx of Visitors From All Points of the Compass.

Thanksgiving Day in Georgia will be a very different kind of a holiday from that which is being celebrated to-day elsewhere in the United States. Instead of the traditional turkey shoot and church service, all of the city of Savannah, much of the State of Georgia, and of other states, will have started bright and early for the automobile race. Churches are closed, shooting ranges deserted, dinners getting cold, and with a goodly share of visitors from north, east, south and west, but mostly north, a throng which no previous forecasts had overestimated hangs on the outcome of the first American Grand Prize race, and which originally was organized as a "spite race" by the Automobile Club of America, of New York, which organization "used" the Savannah club to assist in pulling its foreign chestnuts out of the fire.

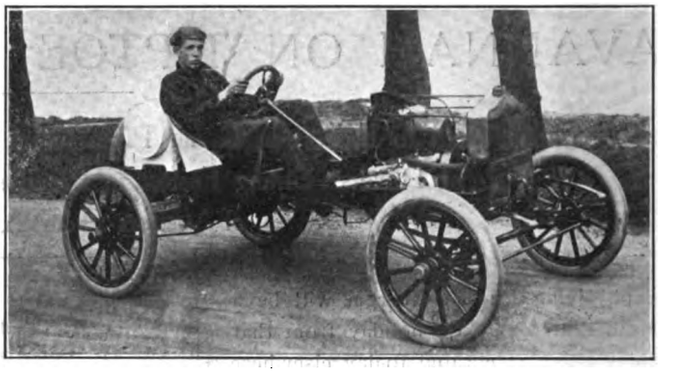
Starting at 9 o'clock, twenty drivers will scurry around the kite-shaped course. But because it is not only kite-shaped, but introduces a number of wonderfully complex side-steppings, kinks and reversals, it is quite the most wonderful course ever laid out in America for a great road race. Much of it has been specially prepared for the occasion. It has been oiled with such zeal that in places it has had to be sanded over to render it safe. It has been banked and tamped and rolled. In its 25.13 miles of length are opportunities for exceptional speed, exceptional skill in driving, and exceptional daring in taking chances. The course is picturesque in its setting; its hazards are all known by fanciful and suggestive names. Where church and State united on Tuesday in offering up Thanksgiving for a bountiful harvest, church, State and the people unite to-day, in the fulfilment of a long-cherished dream.

VIEW OF GRANDSTAND, THE OLD STAND WITH EXTENSIVE ADDITIONS IN THE BACKGROUND.



Like the Grand Prix in Europe, Savannah's great race was preceded by the light car race which yesterday afforded a foretaste of what might be expected on the morrow. It attracted attention chiefly because its setting was practically the same as that of the great event itself. Nevertheless in the performance of 15 small cars built not for racing purposes, but—ostensibly at least, and in most cases actually—for runabout and touring work, was sufficient interest in itself to hold the attention of a big crowd. For the difficulties of the 9.8 miles course may be held to have been in proportion, about as great to these machines, as the difficulties of the great course to the big cars.

The present definitions of "big" and "little" cars are intersting in this connection, as well as novel, for they constitute the European standards of classification, used in America for the first time on this occasion. When the disgruntled Automobile Club of America decided to assert its self-constituted prerogative by promoting a big international race in conjunction with the ambitious and aggrieved Automobile Club of Savannah, or even before the 16 lap Georgia circuit had been chosen for the 400 miles race, it announced the adoption of the European standards used this year in the Grand Prix race over the Dieppe circuit.



These rules require a cylinder bore of not more than 6.1 inches and a minimum weight of 2,420 pounds. The requirement for the light car race was a maximum bore of 3.75 and minimum weight of 950 pounds. No other restrictions were made as regarded size.

As is already well known, the arrangements for the race are very complete, while all sorts of inducements have been advanced to tempt the ambitious contestants. As a stimulus to encourage the establishment, if possible, of a new road record, the Savannah Automobile Club offers a cash prize of $2,500 to the driver who can beat Nazzaro's average of 74½ miles per hour made in the Targa Florio race on the Bologne circuit

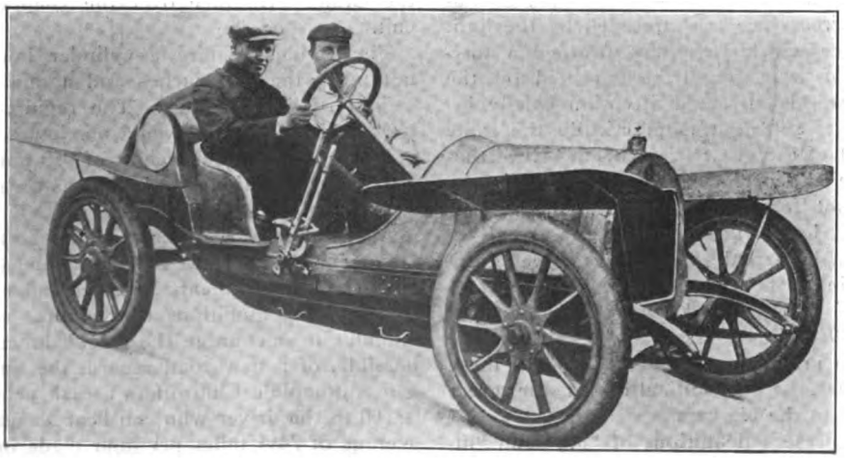
HILLIARD, LANCIA, READY FOR A SPIN

MUNTWEILER, MAXWELL, IN AN IDLE POSE

in Italy last year. The experts doubt if this can be done; the general opinion being that the average speed will be about 68 miles an hour.

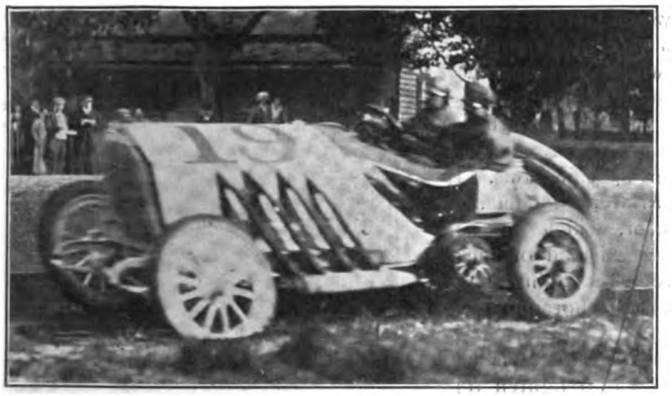


Every precaution has been taken to keep the course absolutely clear so that crowds will not handicap the drivers as has been the case in Vanderbilt Cup races. Even so, the southern crowds, being less familiar with motor cars than those of New York and vicinity, already have proved much easier to control. Last April at the stock car race on this same course, there was no trouble from this source, yet ample provision has been made to curb the unruly element. The military protection includes eight regiments of the National Guard, under command of Major William B. Stevens.

In addition to the military patrol, 135 flagmen line the course. The latter are essentially for the drivers' benefit, each carrying the usual red and yellow flags. The activities of Chairman Robert Lee Morrell and his associates who planned and arranged the contest, have been well rewarded. Grand and press stands have been thoughtfully erected at an angle to the road in order to permit spectators to get a better view of the cars as they sweep down the long stretch than when placed paralleling the course.

Indeed, the extent of the city's appreciation for the event is in no way better evidenced than by the fact that its churches actually changed the date proclaimed by the President of the United States as a day of Thanksgiving, from Thursday, November 26, to the previous Tuesday, in order that nothing might interfere with the Savannah public's desire to see the big race—a thing perhaps unparalleled in the country's history. Realizing that practically every churchgoer would attend the race instead of church services, the various clergymen agreed to hold these services two days ahead—all save one minister, who held out for the traditional Thursday service. His choir threatened to strike however and he was forced to give in.

BURNS, CHALMERS-DETROIT, ON A STRAIGHT STRETCH



GEORGE ROBERTSON AND HIS BIRD-LIKE GREGOIRE

The big drawing card of the Grand Prize contest to-day is that the cream of the world's most famous drivers will be pitted in the fray, a feature which the last Vanderbilt Cup race lacked. The race will be one of drivers rather than cars, particularly as regards the foreigners. All the cars of the latter are of appoximately the same power and aside from accident and tire trouble handicaps, skill will decide the race.

Italy seems to have her share in the way of an "all star cast" of drivers; the team of six comprising five men who are famous in America as well as Europe. Piacenza is the only pilot not known on this side of the Atlantic, while the remaining quintet is composed of a former winner of the Vanderbilt Cup, Louis Wagner; Henri Fournier, one of the pioneer foreign drivers who made records in America some years ago; Alexandre Cagno, of Vanderbilt Cup note; Ralph De Palma, the one American driver on this team, who holds the world's mile track record of 51 seconds; and Nazzaro,

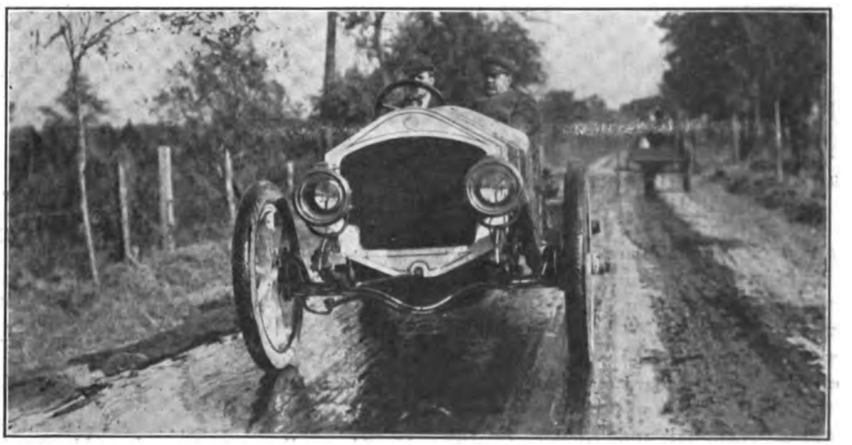
Digitized by Google

ERLE, BENZ, AT THUNDERBOLT CURVE

HAUPT, CHADWICK, AT ISLE OF HOPE

that prince of the "dare-devils." It was Felice Nazzaro who won the three big European races of 1907; the Targa Florio, German Emperor's cup, and the Grand Prix; making an average of 71 miles an hour in the latter, while in the Florio, he set up the average of 74¼ miles an hour, the road-racing record. In addition to this, on the Brooklands cement track with a 4 cylinder Fiat, Nazzaro covered 121.58 miles in an hour. He agrees with other experts in the belief that a new road mark will not be established at Savannah, on acount of the numerous turns.

Of the Frenchmen, Francois Szisz, of early Vanderbilt and later foreign fame, will be watched, and his performance in the Renault compared to that of Lewis Strang, whom fortune favored twice this year and who like De Palma, is an American driving on a foreign team. Arthur Duray, who is to pilot a De Dietrich, as he did in the 1906 Vandelbilt, was born in New York City, although he cannot speak English, having lived abroad most of his life. Hautvast and Rigal are the only members of the French forces not known to Americans.



Victor Hemery, winner of the 1905 Vanderbilt Cup race, is the star of the German representation, while his team mates, Hanriot and Erle, will make their debut on this side in Benz mounts.

The American team has some good stuff in it. All are American boys except Harding, the driver of the National car, who is English. Aside from the latter, the team represents the newer crop of our drivers. Mulford and Seymour were brought into prominence through Briarcliff and recent 24 hours races. "Willie" Haupt was not known until the recent Vanderbilt Cup, in which he made such a splendid showing by holding the lead during the fourth, fifth and sixth laps, when an accident to his Chadwick mount spoiled his chances. Leonard Zengle, the Acme pilot, well known to Philadelphians, made his first appearance in a big road race at Fairmount Park on Labor Day, while Robert Burman has been making quite a reputation at hill climbs and track meets during the past year and was one of the Buick drivers in the Long Island Sweepstakes. All of these pilots are young fellows of more or less experience, but none is quite as seasoned as the majority of the European drivers. When the Grand Prize race starts, one driver will be missed—George Robertson, whose only performance at Savannah was scheduled for the international light car race, at the wheel of the French Gregoire car.

HAUTVAST, BAYARD-CLEMENT, IN A FAST TRY-OUT

While it is probable that no new road record will be established, fast time will be made nevertheless, as has been evidenced by the performances of the cars in try-outs. The fastest lap recorded during the days of practice was that of Lewis Strang, who, in his Renault on Tuesday's additional practice, spun around the 25.13 miles circuit in 20 minutes, 53 seconds, which is at a rate of slightly more than 72⅕ miles an hour—amazing speed considering the many turns

ZENGLE IN THE ACME—NOTE EXCESS OF OIL ON ROAD

Digitized by Google

encountered. The clocking was, of course, unofficial, although S. M. Butler, of the Timers Club, and other expert timers caught this figure.

A glance at the cars themselves reveals the following brief statistics as regards specifications:

The highest powered machine is Duray's De Dietrich, rated at 125 horsepower, although its bore and stroke is the same as the 120 horsepower Benz and Fiat cars. The lowest powered entrants are a quartet of American cars rated at 50 horsepower—the Lozier, Simplex, Buick and Chadwick. In every instance the horsepower of the foreign motors is rated at just double or more than double that of the Americans; none of the European cars rating at less than 110. All of the latter possess the maximum bore, 6.1 inches, while the Simplex is the only domestic car that aproaches this diameter. The only six cylinder machines in the list are flying the stars and stripes, the Acme, Chadwick and National.

Fifty per cent. of the contending cars are shaft-driven, which is a bigger proportion than has been the case in the majority of big races within the last few years; chain drives having predominated in all the Vanderbilt Cup contests, and important events abroad. Despite the opinion which engineers have held for a long time that the chain drive would in time replace the propeller shaft design entirely on big racing cars, the latter type is apparently gaining favor. All the entered cars have three-speed or four-speed selective type change gears, with the exception of the two Renaults, which are progressive.

The heavyweight of the big contest is the Simplex, which tipped the scales at 3,325 pounds at the official weighing in last Saturday, while the lightest is the Szisz Renault, weighing but 2,525.

VICTOR HEMERY'S HITHERTO UNKNOWN SMILE

Seventeen of the field are equipped with Bosch ignition systems, including the entire foreign representation. The Chadwick and Acme have high-tension and the Buick a Remy equipment.

All of the foreign cars are out-and-out racing machines of Grand Prix type, while the Simplex, National and Lozier, of the American team, are essentially stock cars. The Simplex which Seymour will pilot is the same stock car with which George Robertson won the 24 hours race at Brighton Beach in October, and which participated in the Lowell race. The only change in the car is an increase in the bore of the cylinders and the substitution of larger valves, permitted by the cylinder specifications.

The Lozier entry is a Briarcliff model in all respects save the motor, which has a cylinder bore of 5¾ inches instead of the stock 5¼ inches; the stroke remaining 5¼ inches as in the regular 45 horsepower model.

The six-cylinder National candidate is a stock machine, dressed down to lighten it somewhat for racing, but has no special motor or other vital part. Its transmission is identical with the company's other "Big Sixes."

Inasmuch as the turns in the course are so numerous, there being more than 250 to be swung in the whole 400 miles drive, tires will play a vitally important part. That the strain on tubes in rounding corners is what does the damage, is a well-known fact. This has been demonstrated by performances at Ormond Beach. In the 300 miles race there last March, which necessitated very few turns, the late Cedrino drove the Fiat the entire distance on the same set of tires and the tires were quite cool when he finished and showed no signs of wear, while the same car on circular tracks has chewed up tires within a short time on numerous occasions.

Fifteen of the twenty Grand Prize contestants will be shod with Michelins, the

ARGE OF THE RACE

ERT LEE MORRELL, A. H. WHITING, DR. PARKS, F. J. WAGNER

entire German and Italian teams using them, in addition to three French cars and four American. The two Bayard-Clement cars and Duray's De Dietrich will carry Dunlops, while Mulford, in the Lozier, and Seymour in the Simplex, of the American team, will bank on Continentals. All will use demountable rims.

Savannah, Ga., Nov. 25.—The entire City of Savannah is on edge for to-day's curtain raiser of the Grand Prize event—the 200 miles international light car race, which is scheduled to start at 11 a. m. Never before in its history has this southern city been so overwhelmed with visitors or been under such a strain of excitement. Never has it witnessed such a pilgrimage of northern people as that which has been pouring in during the past few days, while thousands from the adjacent and distant cities of Dixie are augmenting the merry throng. The attendance is surpassing that of the stock car race held here last April many fold and those who are harbored in the special trains that brought them, are perhaps better off in regard to accommodation than those who are housed in the hotels. In addition to the army of respectable visitors a great horde of "promoters" also has embraced opportunities presented. Horse racing and pugilistic carnivals have been in full blast and the crowd of gamblers, card sharps and light-fingered gentry that follow in the wake of such "sports" is large and active.

The race which starts to-day will in all probability see 15 contestants face the mark, provided the S. P. O. car which was wrecked, can be tuned up in season. In this contest of the little fellows, it is hard to pick a winner. In the practice trials so many of them have shown their ability to get around the 9.8 miles course in slightly more than 10 minutes, that they seem pretty evenly matched in most cases.

The Maxwell, Chalmers-Detroit and Buick teams, which make up more than two-thirds of the list of contenders, will strive desperately to outpoint one another, for numerous reasons, while William Hilliard, who got acquainted with the motoring public at Briarcliff, will try to "show" the people with the little Lancia "Lampo," (which means Greased Lightning in Italian), and Al. Poole, who made so many friends when he drove an Isotta here in the spring, will go the limit with the Italian company's cradle youngster, the 10 horsepower "Baby Isotta." This was the car that Herbert Lytle was to have piloted, but his unfortunate attack of typhoid fever has precluded it. The little Isotta was purchased last week by George M. Townsend, a 1908 Yale graduate, and son of the late Judge William K. Townsend, of New Haven, Conn. To-day will be Poole's first appearance in a race since his accident while practicing for the Lowell (Mass.) race nearly three months ago, when he broke his collar bone in a smashup.

Frank T. Cameron will be at the wheel of the only air-cooled car, his 22 horsepower namesake, which he drove in the recent Long Island Sweepstakes. Louis J. Bergdoll, the young Philadelphia brewer and automobile dealer, will be the only real live millionaire driver in the race, and will stick to the wheel of his Chalmers-Detroit. This motor enthusiast first sprang into the

HANRIOT, BENZ, AND HIS NOVEL WIND SHIELD

public eye when he made a 100 miles stock car record at Ormond Beach, Fla., last March and later drove with less success at Briarcliff and Fairmount Park. Robert Burman is the only driver who will appear in both light car and Grand Prize events. K. R. Manville, the entrant of the American Aristocrat, a car of his own special design, sent word last Sunday that his entry would not start.

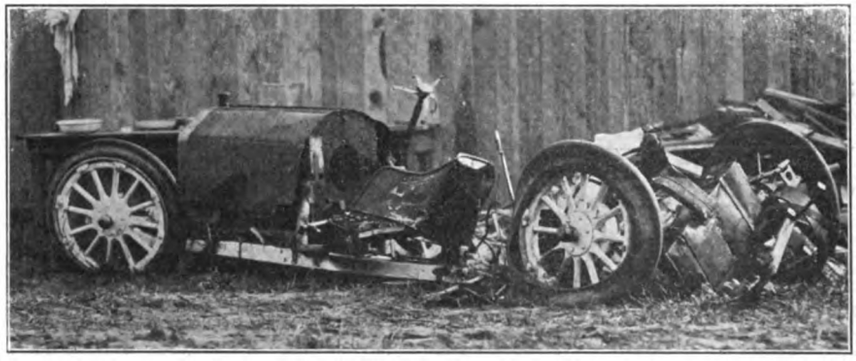
READY TO MEET ANY FIERY EMERGENCY

While the unofficial clocking of the light cars has not been complete by any means, the best time recorded for the 9.8 miles course during the early practice was Earl Jeffers's lap in 10:42 with his Buick, while on Monday, the last day of practice trials, this figure was clipped materially, when Burman had a brush with Cameron and the former made a lap in 10:19 against the latter's 10:23, the best times recorded since the course was thrown open.

Two bad accidents, one of which resulted fatally, marred the practice for the light car race. The first mishap occurred on Wednesday of last week, when Burman's Buick burst a tire and hit a tree, badly injuring his mechanician, Grinnon, who is still confined to the Savannah hospital, where he is said to be improving. He sustained several broken ribs and fractured left elbow, but will recover. Burman pulled through unhurt.

The other casualty which resulted in the death of Marius De Rosa, the S. P. O. car's mechanician, came on Saturday, when Jean Juhasz was trying out this car. Juhasz had made two circuits in 13:32 and 13.21, respectively, and was attempting more speed, when it is said he tried to avoid hitting a dog and swerved into a telegraph pole. De Rosa had his skull fractured by the fall, in addition to internal injuries, and died shortly after being taken to the hospital. The driver of the unlucky car was picked up with a broken leg, but his chances for recovery are good. An effort has been made to repair the car and Conners, who was the late Emil Stricker's mechanic, has been nominated to pilot it. Two days have been spent in straightening out the smashed frame and a rear wheel and axle have been borrowed from a touring car and fitted—an ingenious piece of substitution inasmuch as the new axle is of larger size.



The announcement that George Robertson will not drive to-day has caused much disappointment. He was scheduled to handle the French Gregoire car which, through an error in shipping, did not arrive until yesterday, giving him no opportunity to try it out on the course or tune it up sufficiently.

Another change in drivers for the Grand Prize event has been announced; Ralph Mulford having been named to take Michener's place in the Lozier entry.

Yesterday (Tuesday) additional practice of 1½ hours was permitted on the long course, during which Lewis Strang in his Renault made the record time for the course, going one lap in 20:53. Hautvast, De Palma, Burman, Piacenza and Fournier were also out for less speedy trials.

Scores of negro convict laborers have been at work during the hours when practice was not in progres, repairing spots around the course, that were roughened during trials, and making every effort to put the road in the pink of condition.

The crowds have been swarming the course ever since daybreak, although the fray will not begin until 11 o'clock.

BURMAN'S BUICK AFTER ITS SMASHUP

REPAIRING THE COURSE AFTER PRACTICE

Another Climbfest for Giant's Despair.

That mountain which is considered the best climbing ground in the East, by many people in the motoring industry—"Giant's Despair"—is to be the scene of another annual contest on May 29th, 1909. The Wilkes-Barre (Pa.) Automobile Club has definitely decided upon this date, although the matter of a sanction has not been fully settled. At the time of the Vanderbilt Cup contest President George F. Lee, of the Wilkes-Barre Club, conferred with officials of both the American Automobile Association and the Automobile Club of America, but did not formally apply for a sanction from either body. It is known that the Automobile Club of America intends to run at least one big hill-climbing contest each year and the local motorists, it is said, would like to see this event take place on "Giant's Despair" course.

BALTIMORE SEES GOOD CLIMBING

Smith Makes Best Time up Washington Hill and Wins Two Events—Live Contests in All Classes.

Baltimore's maiden effort at holding a hill climb occurred on Saturday, 21st inst., when the Automobile Club of Maryland conducted its competition on Mount Washington hill. Success crowned the attempt, which several thousand spectators witnessed, and while hill climbs are usually stupid affairs, Baltimore's contest proved a welcome exception to the rule.

The fastest time made for the day was 43½ seconds for the six-tenths mile course, made in the free-for-all event, when Wilfred Smith, driving W. W. Lanahan's 60 horsepower Stearns, succeeded in beating a field of six, including a Stanley and a White steamer. In view of the steep grade, his time was considered no less than remarkable. In addition to this performance, Smith captured the $4,000 event with the same mount in 0:45½, and a few minutes later, when Lanhan, the owner took the wheel in the high-powered amateur event, he drove the machine up the incline for another first place to the tune of 0:46.

In the opening event for cars listing between $1,251 and $2,000, J. L. Cassard, driving a Stoddard-Dayton, made the best time, but was later disqualified for the reason that his car carried a magneto, which not being a part of the $2,000 equipment, placed it above that class. Harry A. Tate, who drove a Chalmers-Detroit, was awarded first place, his time being 1:03½, with J. F. Heaver in a Kisselkar second.

Wallace C. Hood got away with the $2,001 to $3,000 event in 0:54½, when he dusted up the slope one-half second better than J. Sperry's Stevens-Duryea. O. I. Yellott drove a 15 horsepower Ford into first place in the $3,000 and under amateur division, in 1.05, beating his only opponent, H. H. Heyser, in a 48 horsepower Winton, by 5 seconds.

The electric timing system was so manipulated that after each trial the time was at once reported to the spectators along the line and not withheld as is so often the case at hill climbs, at which the mere spectators are kept in the dark as regards scores. The event was so satisfactory that similar future contests seem to be assured.

Non-Repair Trophy for Glidden Tour.

It is possible that the complexities of Glidden tours in general will be further augmented when another competition of the sort is undertaken by the introduction of a new subsidiary competition in which the contestants shall seek to eliminate all repair work. The subject has been broached by Col. George Studebaker, of South Bend, Ind., who has declared his willingness to offer a $5,000 trophy to be competed for in some such way, subject to the approval of the touring board of the American Automobile Association. No special limitations would be placed on cars competing for the "Studebaker Gold Cup," but any device hitherto used to guard against the making of repairs and to ensure an honest reliability score would be employed. These would include sealed bonnets, sealed tool boxes, and official observers. The idea is based upon the desirability of reducing the number of "perfect scores" usually obtained at such times, and of furnishing manufacturers a difficult sort of competition which they might enter to some purpose, yet without the necessary outlay involved in either of the special races of the year.

Belmont Park a Possible Motordrome.

Now that Governor Hughes and the horse racing bills have forced horse trainers, bookmakers, $20,000 jockeys, touts and other professionals to seek occupation as elevator boys, car conductors, shoe clerks and chauffeurs, it is only natural that the race track managers in New York state should cast about for new fields of effort. Morris Park, Empire City oval and the Brighton track that was, became motordromes, to be sure, and now it is suggested that Belmont Park may become an automobile course if no horse races take place there in the spring. As this is a 1½ miles track and is well banked at the turns, it would doubtless prove safer for motor car contests than was the Brighton course, and it is not unlikely that the future may see considerable agitation for its use.

Two Days of Racing for Bakersfield.

Two days of motor racing have been planned for Bakersfield, Cal., to take place on Thanksgiving Day and the following Sunday, November 29. The holiday event is to be a mixed one; both horses and automobiles performing on the same track the same afternoon. The automobile races will be confined to local cars, while on the following Sunday, there will be a 5 miles event for cars listed at $1,250 and under, two 10 miles races—a $3,000 class event and a free-for-all, winding up with an 8 miles handicap. Among the starters in the latter matinees will be several well known western drivers, including Frank Free, Bert Latham, Bert Dingley and Frank Murray.

Five Events for "Dolly Cole" Hill.

Five events have been scheduled for the Rhode Island Automobile Club's annual Thanksgiving Day hill climb at Providence. "Dolly Cole" Hill is the battleground of the affair and various contestants who have entered will endeavor to decide the permanent ownership of the C. Prescott Knight trophy, which has been won two successive years by L. F. N. Baldwin, with a Stanley steamer. Should the latter driver succeed in winning the cup for the third time to-day, it will become his property for all time.

STRANG ORGANIZES HIPPODROME

His Motoring Troupe Ready to Furnish Thrills to Order—Galveston Gets His First Bid for a Date.

Those who have followed with more or less interest, the performances of racing automobiles at various state fairs and track meets in the past will be interested to learn that Barney Oldfield's old "Green Dragon" and "Red Devil," as well as the "Grand Prix" Renault, are now "properties" of a hippodrome team headed by Lewis Strang, under the management of Bill Pickens, of United States Motor Racing Association fame. The newly formed company recently hippodromed at New Orleans, and he who was lauded as the hero of Savannah, Briarcliff and Lowell, evidently expects to make a circuit of dates after the Grand Prize race is run. Associated with him are Arthur Redfern, the ex-jockey, and one or two others, who will provide a line of high strung spectacular performances to the order of any enterprising organization willing to close dates with them on their own terms.

A letter which Strang recently wrote to E. H. Labadie, secretary of the Galveston Automobile Club, is self-explanatory. The driver who is about to follow the circus style of Barney Oldfield and Christie, writes:

"I am going on a trip to the Pacific Coast, starting from Savannah, I will have in addition to my Grand Prix Renault of 120 horsepower, and my Renault 24 racer, two cars formerly used by Oldfield, the Peerless Green Dragon and the Peerless Red Devil. Will, of course, have drivers for the cars and two great motorcycle racing men with racing motorcycles from the Indian factory.

"Here is the first opportunity Galveston has ever had to get such a lot of noted cars for a speed carnival on the beach. If the Board of Trade or other organization can be seriously interested, I would be pleased to figure with you or them for a couple of days. I would say as an estimate of the cost that about $750 would be required to defray the expenses. But you would get some real racing and great speed in return. The date would be early in November. Awaiting your early reply, yours very truly,

"LEWIS STRANG."

Paper Trail to Thanksgiving Feast.

Chasing paper trails for a good dinner is the prospect opened to members of the New Haven Automobile Club for Thanksgiving Day. The plan is to have a secret dinner rendezvous, to which the members must find their way by means of the scatterings of confetti along Connecticut's highways. Those who cannot read the trail correctly will miss the dinner.

JACKSON OFFERINGS FOR 1909

Four Distinct Vehicles, Including Two Brand New Models—Improvements in Older Members of the Line.

Four distinct vehicles comprise the line which the Jackson Automobile Co., Jackson, Mich., is announcing for the forthcoming year. Two of these are entirely new and include a number of unusual features. Of the others, one is continued over from last year with practically no changes, while the other has undergone a number of alterations in matters of detail. The brand new offerings are known as Models "H" and "K." The former a 30 horsepower touring car having 110 inch wheel base and shod with 4-inch tires, and including magneto equipment, sells for $1,600, and the latter a light touring car, also boasts a price feature in its $950 listing, with a $100 reduction when sold with only the runabout form of body.

Model "H" has a 4½ by 4½ inch motor of the quadruple, vertical type, with the conventional arrangement of the valves in offset pockets, three-bearing crank shaft, and cylinders cast in pairs. In many ways it may be regarded as a smaller size of the larger Model "E." This is true in the case of the steering gear, clutch, magneto and other parts which are made to the same specifications for both models. The front axle is a single-piece drop forging. The rear axle, which is of the floating type, is provided with roller bearings next the wheels, and adjustable ball bearings on either side of the differential, which are so contrived that they may be regulated without dismounting the group from the chassis. The propeller shaft has two universal joints and a separate torsion rod. The wheels are 32 inches in diameter, shod with 4-inch tires.

The second of the new models also is a shaft driven car which, however, is propelled by a double-opposed motor, placed transversely in front. The cylinder dimensions are 5 by 4 inches, and the rated output is 18 horsepower. Except for the change gear, the mounting of this machine is similar to that of the last named—at least so far as regards the method of axle mounting, and the arrangement of the propeller shaft and torsion rod. The change speed arrangement, however, is of the planetary type.

The largest member of the line—Model "E"—retains the over-head cam shaft construction which was its distinguishing feature last year, as well as the design of the unit power plant, which is particularly pleasing. The unit is mounted by means of positive suspension members on either side of the fly wheel casing, and flexible members in front and back of it. A feature of the motor design is the use of very large bearing surfaces for the cam shafts and rocker members, while the inclined position of the valves gives an interior cylinder formation which conduces to successful thermal action. The transmission is by propeller shaft, through a multiple disc clutch having five units, of 12 inches diameter, selective change gear, and floating axle. The system is mounted on annular ball bearings, and is lubricated by automatic circulation from the engine base reservoir.

Brakes are arranged in such a way that all linkage is brought inside the frame, and the drums for the internal-external members, are separated by a liberal air space. The steering gear embodies a combination of the screw and nut and rack and pinion types—the nut being long enough to embrace the entire body of the screw, while its exterior on one side is toothed to engage a pinion on the steering rocker shaft, the arrangement providing great strength.

The remaining model—"C"—has a 5¼ by 5 inch, opposed motor, chain drive, and 32 by 3½ inch wheels. Like the other models of the line it has the thermo-syphon system of cooling which has been a Jackson feature since 1906, and is similar to the standard in a number of other respects. While resembling its predecessor of the current year in a number of details, it differs from it in the matter of wheel base, that dimension having been lengthened to 104 inches.

Auto-Meter Presents New Features.

Quite different in appearance from previous models, the new Auto-Meter, produced by the Warner Instrument Co., of Beloit, Wis., embodies a number of changes calculated to add to its desirability as a speed indicator and mileage recorder. In the new model the mechanism is enclosed in a circular case having a flat face, with openings for the figures. The trip register records to a total of 10,000 miles as against 1,000 miles, the usual maximum for trip dials, and the total mileage register has a 100,000 maximum, where 10,000 has prevailed in the past. The speed indications are similar to those in the older models produced by the company, but a new feature consists of a concealed electric bulb which lights all the readings when a button is pressed. Improvements also have been made in the flexible shaft and connections looking to the utmost durability. The instrument incorporates a clock when desired.

Care in Handling Tilting Bodies.

Users of cars provided with tilting bodies should beware of the danger of the supports jarring loose when the engine is running and permitting the body to fall. This contingency usually is carefully provided against by the manufacturer, but at the same time there is danger that a careless operator may neglect to fasten the supporting struts or braces properly when lifting the body to effect a wayside repair.

APPERSON MAKES TAXIMETER CABS

New Product Adapted to Private Town Use or Commercial Purposes—Specifications of the Construction.

That taximeter cabs have for some little time been a product of the Apperson Bros. Automobile Co. has just been disclosed. The factory at Kokomo, Ind., is turning out quite a number of machines of this type, mounted on the regular Model O chassis. The vehicles sell for $3,000 and are suitable for either private, town service or commercial purposes. The motor is of 30 horsepower, with four cylinders cast separately. A double system of ignition is used, including magneto and storage battery. The change gear is three speed selective, and shaft drive is employed, with a full floating type of rear axle. The wheels are "dished," running on a "plumb spoke," and carry 34 by 4-inch tires. The body is of the landaulet type. When desired the top may be pushed back, all the windows concealed within the body work, and the window frames folded down. On order a removable top is placed over the driver's seat and also a removable front glass.

Antidote for Poorly Designed Carburetter.

Although it is not generally appreciated it is doubtless a fact that a considerable amount of fuel is wasted from poorly designed carburetters when the car is running, owing to improper float regulation and consequent dripping from the base of the mixing chamber. To obviate this, it is well in some instances to "damp" the action of the float valve in some way, thus making it less responsive to the dancing action of the float. Sometimes this may be accomplished by limiting the travel of the valve, sometimes by stiffening the action of the light mechanism which connects the valve and float. At all events, it is not sufficient to see that the float chamber does not overflow when the car is standing still and the motor at rest. This must not occur when the engine is being raced, or when the car is running over rough ground. In either case, the waste is at once a source of a small amount of expense and a great amount of danger.

Diamond Rubber Improving a Street.

For a huge manufacturing concern to offer to repave practically an entire street free of expense to its home city is an incident as unusual as it is unexpected. Just such an offer has been made by the Diamond Rubber Co., to the city of Akron, Ohio, the privilege being asked in return for the right to utilize a small portion of the street in order to connect recent additions to the plant with the old buildings. The offer has been accepted and the work will involve a $20,000 outlay.

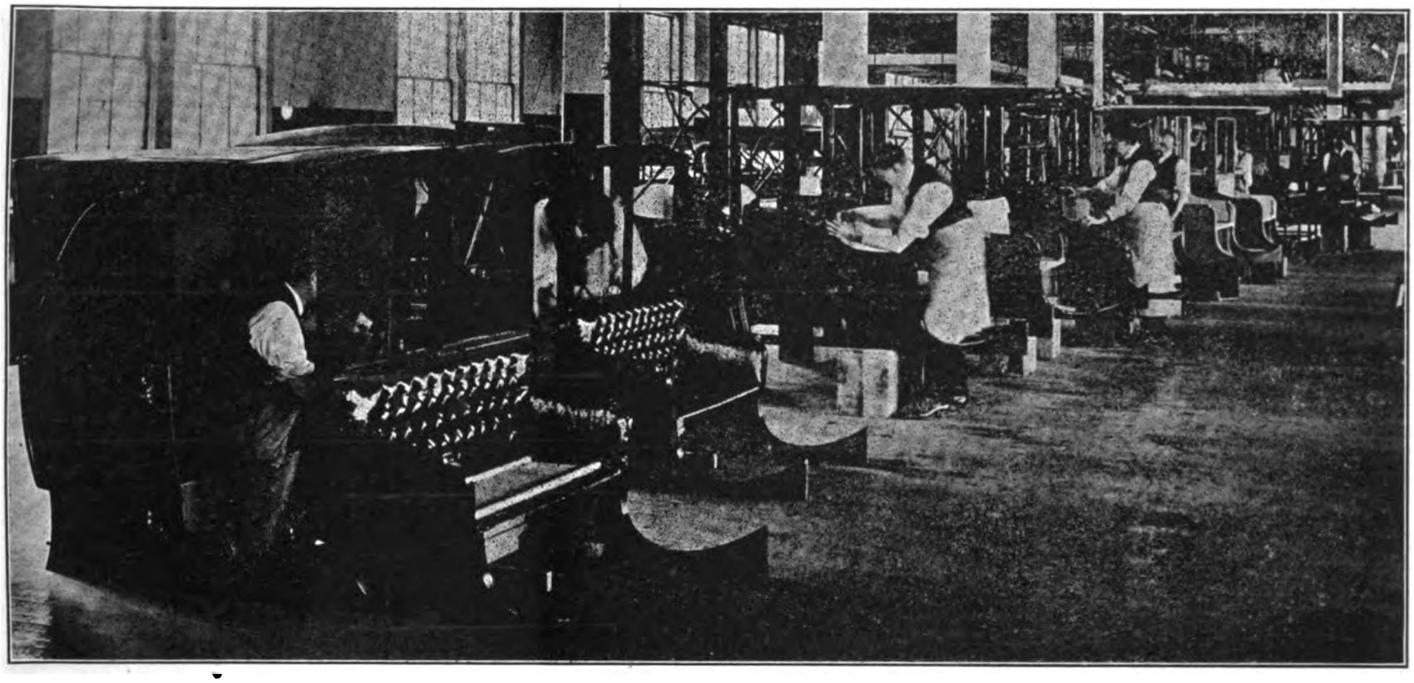
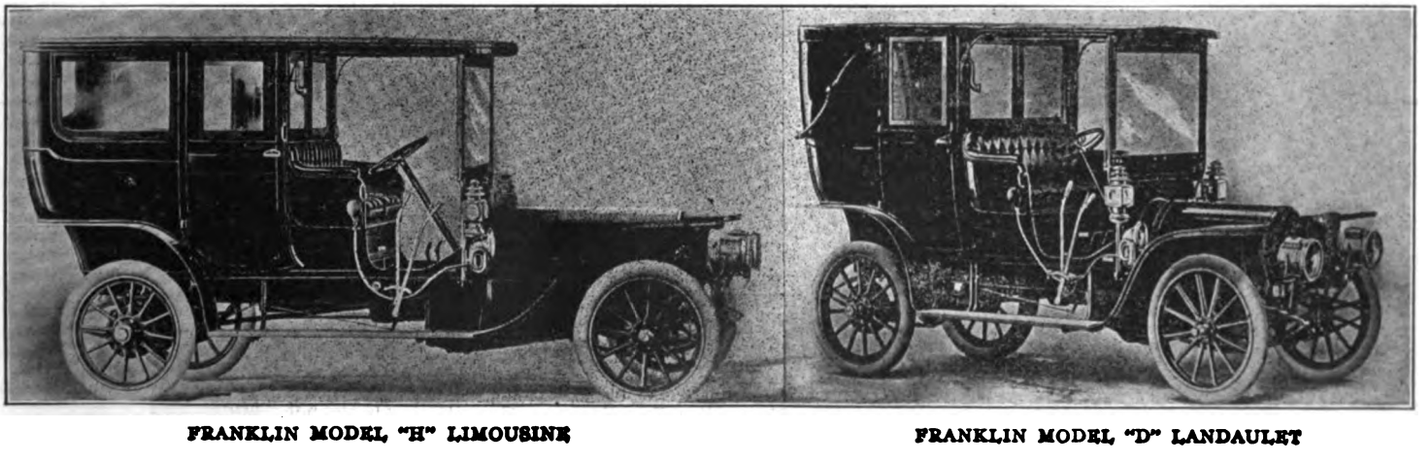
BUSY PRODUCING CLOSED BODIES



Activity at the Franklin Factory Indicates the Growing Demand—Differing Types Included in the Line.

Careful development of the body building department in many of the better equipped automobile factories has been the means of bringing about an unforeseen contingency in the business of production. With the perfection of body types by the car builders has come a growing demand for bodies in some little variety and especially where this demand is beginning to run to mountings of the closed type, it has been found necessary in more than one instance to increase the capacity of the department to keep pace with the orders. In the case of the H. H. Franklin Co., Syracuse, N. Y., the work of the body department is now reported to be a more important factor in the business than ever before. Just at present, work is being advanced rapidly on large orders for closed bodies in the rough and the trestles in the wood shop and the trimming floor are well filled with bodies in all stages of advancement toward the finished state. The rate of production is being increased as the new addition to the plant nears completion, and is gradually being absorbed by the growing departments.



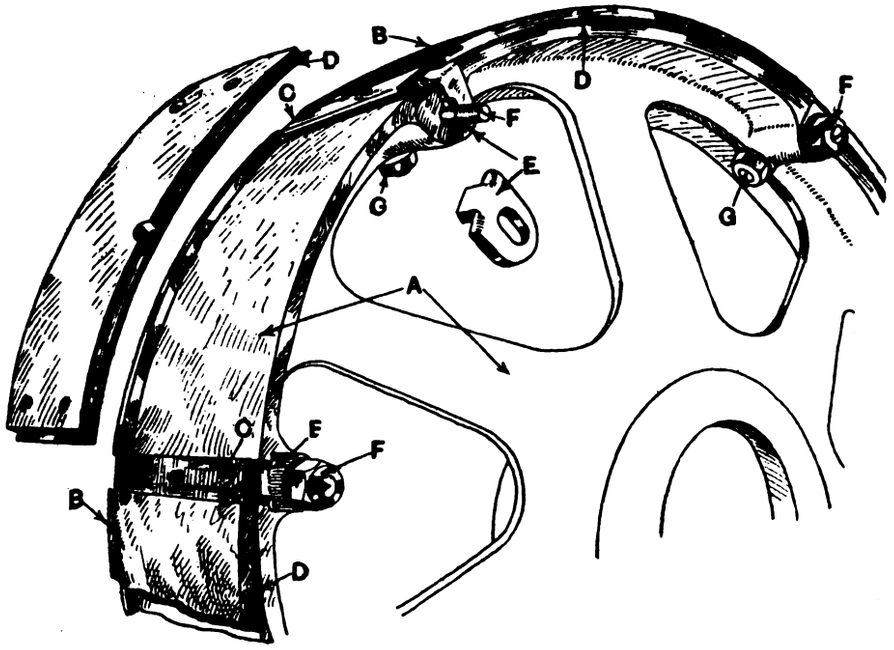
Some idea of the activity in this department, is furnished by the accompanying picture showing a corner of the shop where a lot of landaulet bodies are being finished. The presence of such a large number of stock orders in a single factory, moreover, casts some light on the growing demand for this class of vehicle throughout the industry, for it was only a year or two ago that bodies of this type were made up only on special order, and few makers ventured to risk holding them in stock.

The closed body line, which is a comparatively new feature of the Franklin output, is produced in several different types. They include an 18 horsepower, inside-driven brougham seating two passengers; the "K-2" town car, which is a six-passenger vehicle mounted on the motor cab chassis; an 18 horsepower, four-passenger landaulet—which is claimed to be the smallest vehicle of its class at present on the market, and which is listed at a figure calculated to attract attention—and a second landaulet which is mounted on the 28 horsepower chassis. Both of the landaulets are similar in design and construction, differing only in the matter of size. The limousine is the largest of the group, and is driven by the 42 horsepower, 6-cylinder motor. It seats seven passengers and is quite the most pretentious and largest in the line.

The body construction is all of original design, incorporating a combination of wood and aluminum materials. The chassis employed are practically the same as are used for the touring cars and roadsters of corresponding powers, but are especially strengthened for the purpose. That is to say, in addition to being lengthened out, the frames are stiffened to meet the extra requirements of the added weight.

WHERE THE FRANKLIN CLOSED BODIES ARE BUILT

FRANKLIN MODEL "H" LIMOUSINE



FRANKLIN MODEL "D" LANDAULET

NEW FEATURES IN CONE CLUTCH

Provision for Removal of Leather Lining in Sections—Novel Construction of Springs Under Bearing Surface.

It might be supposed that the ordinary type of plain cone clutch had been reduced to practically its lowest terms long since. That such is not the case, however, is shown by the development of a new device in connection with the clutch applied to the latest model of the British Austin car, in which provision is made for the complete removal of the leather lining in sections and by means of an attachment suggestive

in a way, of the mounting of the familiar detachable rim in the tire field. An additional feature of unusual merit and originality lies in the use of relieving springs which are continuous throughout the bearing surface of the leather, and secure the initial contact at the center of the leather instead of at the smaller end of the cone as in ordinary practice.

In order to effect these improvements the ordinary conical spider—otherwise cast in the same manner as the usual clutch cone—is provided with a set of six T-shaped lugs running across the face of the cone parallel to its axis and forming with the cone surface a series of slots into which the ends of six strips of flat spring steel are fitted. These strips form at once the relieving springs and the backing for the leather facing of the clutch, the facing being in sections corresponding to the shape of the strips, and which are riveted in place in the usual way.

The accompanying illustration indicates the arrangement in detail. The clutch spider proper, A, is of perfectly regular formation except that at intervals it is provided with bosses running across its lower face and arranged to mount the lugs, C, which engage the ends of the spring plates, D, upon which the leather facing, B, is secured. Studs, F, projecting from the ends of the bosses carry the clips, E, which hold the plates in position once they have been slid into place. Additional security is furnished by the secondary studs, G, which draw the lugs, C, downward.

Instead of being perfectly flat, the strips are crowned through the center, thus forming a very slightly elevated ridge through the center of the engaging surface of the leather, but one which yields to pressure due to the flattening of the crown of the strips when the female cone of the fly wheel is engaged. The arrangement of the slots in the male cone into which the strips are slid permits the latter to be withdrawn at any time without removing the clutch from its shaft or in any way disturbing its mounting. When the cone is disengaged, a series of six bolts on its rear face are loosened, thus releasing as many lugs, which lock the sections of the facing in place. As soon as this is done, one or more of the sections of the working face may be withdrawn, when it may be renewed, cleaned, treated with oil by soaking it in a pan, or otherwise repaired in a few minutes time. The clutch is but little more complicated or heavier than the ordinary type, is simple to handle, and possesses the further advantage to the tourist that a complete extra working face may be carried in the tool kit, packed in small compass, for use in case of a burn out of the leather or any other accident of a similar nature, this in itself compensating for whatever there is of extra weight in the part itself.

RATIOS OF WEIGHT AND CAPACITY

Wherein Automobile Design Excels that of Railway Vehicles—Data Based on Results of Actual Comparison.

Vehicle weight in proportion to horsepower has received considerable attention in the automobile industry at one time or another, although the question of weight in proportion to passenger or load-carrying capacity has not been subjected to close scrutiny. In other lines of transportation, however, and particularly in the field of railroading it is rated a matter of considerable importance, though exact figures are not always readily obtainable. Considering the fact that in only rare instances the railway car is compelled to carry its own power plant complete and that in any event it is driven or drawn over a right of way which is specially prepared for the purpose, it might be supposed that its ratio of weight to useful capacity would be greater than that of the motor vehicle designed for highway use. That such is not the case, but rather that the automobile, even when of the most complete and luxurious type is considerably lighter, is much to the credit of the designer.

Until recently no data on this subject that might be regarded as authoritative, has been compiled. A street railway and electrical journal, however, a short time ago, made an investigation of various models of electrically driven passenger cars. Forty-six different cars were used as the basis for the compilation and most of them were found to weigh from 1,200 to 1,333 pounds a seat, the number of seats ranging from 40 to 71. The range in weights may be appreciated when the fact is shown that of two cars, each seating 60, one weighed 854 pounds per passenger and the other 1,213. Little argument would be needed to show passengers which of the two would be safer for traveling, or a buying company which would prove more durable. The Pullman company goes still farther on the question of weights, its sleeping cars with a capacity for 30 people, weighing about 125,000 pounds, or 4,166 pounds per passenger.

In this connection it is interesting to compare with the figures the weight of the full-fledged touring car. As an example, a six-cylinder Pierce Arrow, developing 48 horsepower, with the water, oil and gasolene tanks filled, and equipped with a cape top and glass front, weighs only 572 pounds per passenger. One of six cylinders, developing 60 horsepower and with the tanks all filled and similarly equipped, weighs 639 pounds per passenger. The weight per passenger of the touring car as compared with the interurban trolley is thus just one half, while in the same way it has but a little less than one-seventh the weight of the Pullman sleeper.

BATES'S BAIT FOR ORDERS

Cut Prices for Customers Ordering by Mail —"Just as Good as Anybody Else's" the Modest Claim.

Solicitation for mail order retail tire business has been tried for some time by cut price houses, but a rubber company manufacturing tires and planning to sell its output by mail order methods at cut price figures is a little bit newer. Yet the blessings of such an institution were not to be withheld from the private owner forever, and at last he is to be delivered from the greed of the established tire concerns through the introduction of that modern method of merchandising expressed in crystalline form as "from Kalamazoo direct to you."

Kalamazoo does not happen to be the place in this instance, but the principle is the same, or is intended to be. Rutherford, N. J., is the happy spot, and the Rutherford Rubber Co. is the firm. That the company knows what it is about in soliciting business by mail almost goes without saying after it is disclosed that its president is none other than Charles Austin Bates, who as an advertising expert at one time deigned to criticize and improve the "copy" for advertising letters and pieces of business literature, at from $5 to $50 per piece.

Until recently Bates has been proving the efficiency of his circular letters by marketing mining stock through their use. In turning to tires he brings to bear the master touch of experience in the letter writing art, giving at once a vigorous presentation and an impression of great self-restraint in endeavoring to state the facts fairly and with simple modesty.

According to the letters, the Rutherford proposition contemplates saving the owner of a car from $10 to $40 per tire, or from 25 to 60 per cent. on tire expense. Even the most ardent seeker after bargains would make an inquiry into the quality of tires offered, however, so that this point is carefully covered.

It is all very simple. As Bates himself explains, "There is no mystery about an automobile tire. Anybody who wants to and knows how, can build a good one—just as good as anybody else's." Continuing he names several prominent makes which he pronounces "good tires simply because their makers use good rubber and fabric and put them together right."

Such being the case it is made clear where the company's own tires stand. No bragging or wild statements when it comes to that point. Not a bit of it! Bates actually confesses that "they are not better than the best—only as good." Who could help but feel confidence in products backed by people making their claims in such a gentle, open and above-board way? Most people in trying to sell goods enumerate certain advantages or points of superiority, but Bates is quite content to pick out the world's best in tires and to let it be understood simply that his tires are of the same quality.

It will no doubt be a great surprise to the trade to learn that "there are no secrets" about the manufacture of automobile tires, according to Bates. The blow will fall hard on some of the bigger makers who have been paying enormous salaries to men who make pretences of special rubber knowledge. After all the money that has been spent in the past in developing successful "compounds" and vulcanization treatments, it is disheartening for the older tire manufacturers to find that Bates has wrested their secrets from them and is willing to share them with the world at large.

Following the policy of making it as easy for the customer as possible, the first letter to the owner whom the company seeks to interest, contains a return postal card which only requires the filling out of the name and address to bring all the details and prices. As a quiet tip, however, it is unnecessary to fill out the card, the proposition being pretty sure to come along anyway. Sure enough, the second letter tells all about it, whether the first one has been ignored or not.

Enclosed with the letter is the price list, together with a duplicate order blank, just such as one would fill out in buying mining shares, and having pretty red serial numbers in the corner. Under the name of the tires is printed "Wear! Wear!!" but it is not made clear whether slowly or quickly. As for the price list the "blue tubes" are exactly the same in price as the retail list prices on Diamonds and other lines, while the prices on the casings in no instance are as much as either $10 or 25 per cent. less than the retail list on standard tires, which in view of the fact that the letters promised a saving of from $10 to $40 on each, or from 25 to 60 per cent., is something of a disappointment, no doubt, to the man who has fallen under the spell of the persuasive Bates advertising "copy."

Instructive Reading for Agents.

Agents ambitious to become well posted on modern methods of selling motor cars as well as of advertising and building them —and Rambler agents in particular—are likely to derive no small interest and profit from the pages of the Dealer's Number of the Rambler Magazine which has just been issued by Thomas B. Jeffery & Co., Kenosha, Wis. In addition to a complete description of the 1909 line of Rambler cars, considerable space is given over to descriptions of the methods of manufacture and sale of the cars, suggestively illustrated and conveniently arranged.

RATING OF IGNITION CAPACITY

British Society of Motor Manufacturers and Traders Adopts Specific Rules—Official Label to be Used.

One of the minor abuses to which the accessory branch of the British automobile trade has been subjected is the rating of ignition accumulators according to a more or less imaginary capacity. "Ignition capacity," as it is called, of course is of practically no value to the user, because of the varying consumption of ignition devices under different conditions of adjustment and load, as well as the varying resistances which they oppose to the passage of the current. To simplify matters and ensure for the user a rating which shall be at once comprehensive and sufficiently accurate to enable him to use the batteries intelligently, the tire and accessory section of the Society of Motor Manufacturers and Traders has made an investigation as a result of which certain recommendations are made and an official "S. M. M. T." rating established which all manufacturers may use, provided they agree to certain conditions.

The rating rules are as follows:

"(1.) Accumulators shall have printed on their labels their actual capacity when discharged at a definite rate continuously, this rate being one-twentieth of the capacity claimed. An interval of rest to be allowed, such interval not to take place until half the period of discharge has expired.

"(2) The accumulators can have printed on their labels the approximate capacity with intermittent current, which shall be arrived at by doubling the actual capacity obtained by following Rule 1.

"(3) In cases of dispute on the subject of the actual capacity of an accumulator, such dispute may be referred to the S. M. M. T., who may order tests carried out on the basis of Rule 1 by some competent authority, such as the Electrical Standardizing and Training Institution, Faraday House. London."

The officially sanctioned labels will read:

Capacity.	S.M.M.T. Rating.
Actual capacity at constant discharge	Amp. hours
Approximate capacity with intermittent current	Amp. hours

White Construction for Ambulances.

How the principles of White construction have been embodied in the various ambulances, patrol wagons and buses which have been produced by the White Co., Cleveland, Ohio, is told in a booklet recently issued. Illustrations show ambulances used by the War Department, Navy Department and by the cities of New York, Philadelphia, Chicago and Trenton, as well as those of private hospitals.

CLUB AND ASSOCIATION DOINGS

How the Organizations are Promoting Interest in Motoring—Active Work for Making the Highways Better.

Treason to the horse might almost be suspected in the case of the organization of the Fulton County Automobile Club, at Atlanta, Ga. The club had its orginzation meeting in the rooms of the Piedmont Driving Club, supposedly sacred to equine interests. But many of the members of the latter club are broad enough in their view to appreciate both motor cars and horses, and did not hesitate to go into the new movement. The officers chosen are as follows: Edward H. Inman, president; Charles I. Ryan, vice-president; W. G. Humphrey, secretary and treasurer. It is the intention of the club to build a country club house immediately. Among the objects of the new club the creation and promotion of interest in the good roads movement naturally holds prominence, and in this it will co-operate with the horse drivers' organization.

At Newton, Kan., the motorists have organized the Newton Automobile Club, and among its first activities is the preparation of a good roads campaign. A "permanent roads committee" has been appointed and it will be the duty of the committee members to make frequent trips over the neighboring highways and to take note of road defects and the possibilities of improvement. Following these investigations, conferences will be held with the road overseers in the districts where the poor conditions exist, with a view to arranging for the necessary repairs and attention. The club declares itself willing to pledge financial aid for the work.

To establish a fund for the apprehension and conviction of automobile thieves and to take action against persons who throw nails and glass in the streets, the motorists of Fort Wayne, Ind., have formed the Fort Wayne Automobile Owners Protective Association. A fund of $500 was subscribed at the first meeting, for the purposes indicated. In addition to its aggressive legal plans, however, the club expects to effect more social objects as well. The officers selected include E. H. Merritt, president; George DeWald, vice-president; A. L. Randall, secretary, and Van B. Perrine, treasurer.

By the appointment of "inconsiderate driving committees" the local clubs belonging to the Royal Automobile Club of England are not intending to further inconsiderate driving as might be supposed, but are preparing to lessen it as far as possible. Strong action is to be taken against offenders, including expulsion if they be club members, and the police and public are invited to co-operate with the committees in reporting and prosecuting the guilty drivers. The committee for each local club consists of five members, and they are required to investigate all cases within their jurisdiction. The club's definition of "inconsiderate driving" includes every case in which another user of the road is put to unnecessary inconvenience, whether there has been an actual infraction of the law or not.

Prizes for those of the Chicago Motor Club who bring in the most new members indicate the earnestness of the club's intention to raise its membership to at least 300. The "300" campaign is now under full swing, and awards of $100, $50 and $25, will be made to those who secure the first, second and third largest number of applicants, respectively. To create an interest in the club's election, a novelty has been introduced, consisting of a nominating committee whose duty it will be to select at least two complete tickets for all the elective offices, before the club election on December 12.

Instead of waiting to get driblets from the legislative mill, a number of wealthy Trenton automobilists, comprising the membership of the Mercer County Automobile Club, have just completed at their personal expense, the oiling of a section of road between Trenton and Mercerville, N. J., on the route from New York to Philadelphia. The treatment given the road surface is said to have proved an entire success in laying the dust, and the people along the section express themselves as delighted with the result.

Burdened as it is with the name La Moviganta Klubo, the fashionable women's motoring club of Philadelphia is thriving and happy. Among its latest achievements is the perfecting of an arrangement with the Royal Automobile Club of England by which the Movigantans become associate members of that organization. The compact gives the Philadelphia women all the privileges of membership in the Royal club in European touring.

Over fifty automobile drivers and mechanics of Omaha, Neb., met recently and formed the Nebraska Association of Automobile Drivers. The association plans to increase the efficiency of its members by providing a technical library and by having technical addresses, from time to time. In addition to its social program, the association will also take a hand in local legislative regulation. The officers elected are: A. Schultz(president; Charles Crawford, vice-president; Gus Rudolph, recording secretary; Robert Melvin, financial secretary and treasurer.

Danger signs at short distances from railroad crossings and bad hills, culverts and turns, are to be put up by the Columbus Automobile Club in Columbus, O., and on the outlying roads. The latter will also be posted with signs giving road directions and distances. All the signs will be in blue and white enamel. Contributions for the work, which is quite expensive, are being sought from all automobile owners of the vicinity.

Distribution of scenic tour maps has been undertaken by the Wilkes-Barre Automobile Club, the maps showing ideal tours to New York, Boston, Philadelphia and other large cities, by way of Wilkes-Barre, Pa. The club is also completing arrangements for a magnificent new club house, where visiting tourists will be welcomed.

Under the name of the Lehigh Valley Motor Club, 35 automobilists of Bethlehem, Pa., have organized for both social and practical purposes. The first election of officers resulted as follows: Robert L. Stuart, president; H. R. Seaman, vice-president; William D. Shantz, secretary; Fred H. Sterner, treasurer.

Holding the interest of the members through the winter months is the object of a series of dinners and lectures that have been arranged for by the Automobile Club of Portland, Ore. The lectures will be given in a convention hall which has been engaged for the purpose.

Herbert M. Sawyer has been elected secretary of the Massachusetts State Automobile Association, to take the place of J. Fortescue, resigned. The new secretary resides in Worcester, Mass., and has been assistant secretary of the Worcester Automobile Club.

Private owners and agents have combined at Madison, Wis., and have formed the Madison Automobile League. The following officers have been chosen: W. E. Petrie, president; Dr. Frank Smith, vice-president; A. E. Austin, secretary; and M. H. Conklin, treasurer.

The Port Caddo Motor Club has been formed and will have its headquarters at Caddo Lake, Texas, where a commodious clubhouse is being built. Judge Lyttleton has been chosed president, with Sid Coleman, secretary, and Fred Heidelberg, treasurer.

Santa Barbara Vetoes Road Bonds.

After a very animated campaign, the voters of Santa Barbara county, Cal., have rejected by a close vote the proposition to issue $1,250,000 worth of bonds to aid in the construction of a through road from San Francisco to Los Angeles. The chief objection made was that it would put too great a burden on the county alone, particularly in view of the fact that Governor Gillette's plan to have the State issue $18,000,000 in bonds for the building of improved roads is likely to go through in the near future, in which case the money would be forthcoming from that source.

HOW FINES ARE IMPOSED BY MAIL

Magistrate Naar's Methods Aired in Prosecutor's Bill of Particulars—The Case Against Him Advances.

A sequel to the announcement of last week that action had been brought against Justice of the Peace Manfred Naar, of Trenton, N. J., for alleged illegal methods of administration in conducting a mail order system of fining motorists accused of exceeding the speed limit, came on Friday last when Joseph A. Sexton, of Perth Amboy, filed in the New Jersey Supreme Court at Trenton a bill of particulars in the damage suit against Naar, for alleged false arrest and fine in connection with an alleged violation of the New Jersey speed law. Sexton denies that he violated the law as charged by the Justice of the Peace and claims that the action was an effort to extort money from him. He sues for $200 damages for the arrest and fine.

On August 18 last, says the complainant, Sexton received from Naar a letter saying that there had been lodged against him a complaint by Officer Wright, of Mercer county, of excessive automobile driving on August 16. Sexton was ordered to call at Naar's office and answer the complaint on August 22. The letter went on to say that in case of failure to appear judgment would be entered and filed with the Department of Motor Vehicles.

The bill goes on to show that the complainant replied by letter, denying any speed law violation and expressing unwillingness to come to Trenton on the date named because of the inconvenience. On August 20 Sexton received a second letter from Naar, written on a letter head of the New Jersey Detective Bureau, in which it was said that if he did not care to appear for a hearing he could send a check for $8.75 fine and costs and that would settle the matter. A check on the First National Bank of South Amboy endorsed by Naar is one of the exhibits in the case.

Pennsylvania Judge on Illegal Arrests.

By the terms of a recent decision in Pennsylvania it has been established that before arrests of motorists can be made for violating the speed law, it must be proved conclusively that the offending motorist has covered a full mile in less than the time limit prescribed by lay. The ruling was handed down by Judge Sadler at Carlisle, on November 16th, in a habeas corpus proceeding brought on behalf of a chauffeur for John Hay, a local attorney. The constable making the arrest in the case had testified that he had measured a quarter mile course, over which the accused had driven at excessive speed. Judge Sadler also decided that justices have no right to issue warrants outside the county in which the offense is committed; that the action is civil or penal and not criminal and that the commonwealth cannot be a party to the proceedings.

Joy Riding Chauffeur Loses License.

"Joy riding" without permission from the owner of the car has resulted in the revocation of the driver's license of John Krumbine, of Elizabeth, N. J., who on the night of October 20 took a car from the garage of the Elizabeth Automobile Co. and started out with a merry party. The machine did not go very far before an accident took place which ditched it and did considerable damage. State Commissioner of Motor Vehicles J. B. R. Smith, in speaking of his action in revoking Krumbine's license, said "All such cases will be summarily dealt with by this department. These night rides are nearly always in violation of the speed limits, generally result in the intoxication of the drivers and occupants of the machines, and endanger both the lives of those in the cars and of people riding or walking on the roads."

Bridgeport Will Punish Reckless Drivers.

Bridgeport, Conn., has been aroused over a series of recent accidents due, it is charged by some, to the lax administration of the present automobile law, and by others to inherent weakness of the law itself. Early last week, Mayor Martin issued an order to Chief of Police Cowles, to instruct his forces to arrest every motorist found driving in a reckless way through the streets. The order is a repetition of one issued some time ago, but hitherto enforced principally by men detailed for the purpose. In the same connection, an open letter to Chief Cowles has been officially endorsed by the Automobile Club of New Haven counseling a better enforcement of the law and offering to place a fast car at the disposal of the department for overtaking offending motorists who seek escape in flight.

Jersey Licenses Must Soon be Renewed.

Former holders of New Jersey licenses are being reminded by J. B. R. Smith, commissioner of Motor Vehicles, that it will be necessary to take out new licenses on December 31, and that the authorities will be very severe in apprehending and punishing those who try to operate their machines within the state on old licenses. Owners are advised to forward their application for new licenses at once, and the commissioner promises that delivery on the new tags and cards will be started by December 1 or earlier. Commissioner Smith's original anouncement called for the filing of applications at the main office of the Department of Motor Vehicles at Trenton. A later special order, however, announced that applications filed with A. B. Le Massena, Newark agent of the department would receive proper attention.

FOR UNIFORM NEW ENGLAND LAWS

Interstate Conference of Governors and Other Officials in Boston—Automobile Legislation One of the Topics.

Unique in the Annals of legislation is the first New England Conference on Uniform Laws, which opened in Boston on Tuesday this week. Its roster includes the governors, lieutenant-governers and governors-elect of New England, senators, members of congress and other officials of the six states represented. As called by Governor Curtis Guild, Jr., of Massachusetts, its purpose is to "consider the common needs of all, especially in the way of speedy enactment of uniform laws." Among the leading subjects under consideration are: The preservation and cultivation of forests; the safe-guarding and protection of supplies of sea foods; the construction and use of highways, with especial reference to the regulation of automobiles. Tuesday afternoon's session, when the highways question was discussed, was addressed by Harold Parker C. E., delegate to Paris International Congress of Roadbuilding, and chairman Massachusetts Highway Commission; James H. MacDonald, president American Roadmakers Association, Commissioner of Highways of Connecticut; ex-Governor Nahum J. Batchelder of New Hampshire, Master of the National Grange, also read papers.

Movement to Compel Lighting of Parks.

An early victory in the campaign which the New Jersey Automobile and Motor Club is waging for the betterment of the automobile law was the securing of the passage of a resolution by the Newark Board of Trade on Saturday last, requesting the Park Commission to compel all vehicles entering the parks at night to carry a proper light. A further recommendation to the Commission was that the present Elwood avenue entrance to Branch Brook Park "be straighened and widened, that proper lights to insure safety be placed on this and other drives within the park, and that shrubbery which obstructs a clear view of the highway at this entrance be removed." This entrance has long been regarded dangerous.

Park Restrictions Lessened in Boston.

Non-skid treads for tires, including those having metal studs or wire points, have been restored to good standing in Boston's parks and boulevards through the action of the Metropolitan Park Commission in rescinding its rule, passed last March, prohibiting their use. Ever since the rule went into effect the motorists have made a strong fight for its annulment. The prohibition still prevails against the use of ropes or chains on the tires, but efforts will be made to have this also removed.

BANISHES HOODOO WITH FIRE

Santa Rosa Man Celebrates the Election with an "Auto-de-Fe"—Consigns His Bewitched Car to the Flames.

Small boys in an exuberance of Election Day spirits have been known to burn up wood sheds, cellar stairs, roll-top desks, pianos and other articles of furniture, but when a full-grown man celebrates the victory of a presidential candidate by cremating a healthy, robust motor car, he bids fair to become an eligible applicant for the funny house or St. Vitus's Dancing Academy. Jake Luppold, Esq., of Santa Rosa, Cal., who had been "seeing things at night" was the gentleman to distinguish himself a few days ago by burning his car at the stake, even as the Maid of Orleans was burned some years back. Luppold did not do this because of any election bet he had made, but because he was of highly superstitious temperament, and really believed that the car was haunted and a "hoodoo." Seeing the machine blaze into a pile of ashes and twisted metal, the owner chuckled in much satisfaction and was thoroughly convinced that he had killed the hoodoo forever.

So happy was he over it that he celebrated the occasion by treating a number of his friends to a glorious banquet. In addition to killing the little black man of the motor, Luppold also vanquished the hop hoodoo. He said so himself. The hop hoodoo cashed in only incidentally and it was a clever trick, too, for the pyre was made with a bale of 1907 crop hops. The hop crop of that year, it must be explained, was a Jonah harvest.

Some weeks ago, when Luppold announced that he was going to sacrifice his car, he was flooded with letters from persons begging him to refrain from performing the wanton deed. Luppold was unmoved by all of these sentimental pleas and applied the torch with his own hands. The car was not insured.

"Tag-Day" Hold-up Strikes Motorists.

"Stung again!" that useful phrase, has a lot of hard work before it as the result of the invention of "Tag Day." As yet there have been only a few try-outs of "Tag Day," but these have been so successful from the perpetrators' point of view that the institution is likely to visit all parts of the country before it dies. As may be suspected it is a species of "hold-up" for charity and makes special provision for forced contributions from automobilists. In addition to small tags for pedestrians, which the latter have to pay for when the earnest charity workers pin the devices on their victims' lapels, there are prepared a goodly quantity of pennants in gay colors for attaching to motor cars. Eagle eyed watchers on the streets on "Tag Day" quickly see any machine that has not got its outfit of pennants, whereupon the driver is cheerfully stopped and made to "cough up" for a set. Unlike the church fair, however, only one contribution is called for, the pennants granting immunity for the rest of the day. In those places where the scheme has been tried, the local motorists, knowing the purposes for which the money was to be used, would contribute without demur, but transient tourists in some instances were less agreeable.

Eau Claire Gets a Motor Car Cheap.

Eau Claire, which is also called Hyatt Park and which is not far from Columbia, S. C., has gained an automobile even if it has lost a fine. A colored chauffeur, who a few days ago ran his machine at high speed through the center of town several times in spite of the newly posted ordinance calling for a 15 miles per hour maximum, was finally followed up and approached by the local constable. The negro was standing on the sidewalk when the officer came up, and scenting trouble he took to his heels. This did not disturb the constable, however, who calmly took possession of the car. The driver has not come back and the town is still holding the machine and wondering if the owner will ever appear to claim it.

Too Swift for the "Ambulance Chasers."

Chasing ambulances, for the purpose of getting the prosecution of damage claims that may be brought by the accident victims, has become a work requiring considerable stamina and sprinting ability since the introduction of the motor ambulance. The "runners" for damage claim lawyers have in the past been well able to keep up with the horse drawn vehicles, and even to board them and thrust the lawyer's cards in the victims' faces, but the motor ambulance is too fast, both in going to the scene of catastrophe and in returning to the hospitals. It is not easy therefore for the "runners" to find out either where the accident occurred or where the injured persons were taken, until it is too late for their purpose.

La Salle's One Horsepower "Automobile."

After considerable boasting about the automobile which was being built by the Young Men's Athletic Club, of La Salle, Ill., the machine itself has made its appearance. It is of one horsepower, the horse being placed in the center of an old wagon frame, but concealed by burlap curtains. A wringer in front constitutes the starting crank, and the canopy top is made of old umbrellas. All the other fittings and accessories are of the same order, and the club members propose to enter the machine in all automobile parades and races in the vicinity to which it is eligible.

HOODOO TAKES FIERY REVENGE

Danville Doctor Gets Full Benefit of the "13" Incubus—Rebukes His Machine and It Goes up in Fire.

Sailor superstition as to "hoodoos" attaching to certain ships has a parallel in the growing conviction in some quarters that not a few cars are unlucky. Among the recent converts to this belief is Dr. H. A. Greer, of Danvilee, Ill., who has reason to feel that a real, live "hoodoo" was on his machine. The car was ordered on June 13 and arrived on a Friday. Its registration number was 13,858, of which the last two digits make 13, as do the two next the last. The first accident occurred on the first Friday in July, when the machine collided with a street car, suffering considerable damage. By August it was fully repaired, and had two smashups in that month one on the first Friday and the other on the 13th. On September 13 it had another, followed the next Friday by more trouble, and coming to grief again on the succeeding Friday by a breakage of the steering gear, which almost resulted in catastrophe.

Afraid to trust himself in it on either a Friday or the 13th of the month, Dr. Greer left the car in the garage on Friday, October 2, although the evening before it had been reported as ready for service again. He used it on the following days without incident, however, until Thursday. On that day he addressed a few serious words to the machine, telling it that on the next day, Friday, it would have to stay locked up in the garage on account of its bad luck. In revenge the car carried him a good distance from home and then took fire, burning up so rapidly that the hose company which was called to extinguish it, found only a smouldering and worthless pile of junk. The unfortunate owner is going to get a new machine, and likewise a new registration number.

Melodramatic Rescue of Scared Motorists.

Daring rescues, in which the hero dashes out and stops a runaway horse driven by the heroine, have taken a more modern phase in which a blazing and uncontrolled motor car supplants the equine portion of the setting. Chicago had a demonstration of the latest thing last week when Frank Mack, a chauffeur, rushed out into the street and hopped aboard a runaway automobile that was spurting flames and in which four frantic women were screaming for help. The woman driving the machine had lost control of it through her excitement, but Mack quickly took her place and brought the car to a stop. The women jumped out and extinguishers soon conquered the fire.

The Week's Patents.

896,362. Resilient Wheel. Samuel S. Childs, Bernardsville, N. J. Filed Jan. 28, 1908. Serial No. 413,046.

1. A resilient wheel comprising a body portion having a felly, a rim surrounding the felly at a distance therefrom and forming a space between them, pairs of members placed at intervals in the space, means for securing one member to the felly, means for securing the other member to the rim, a pair of resilient blocks placed between each pair of members and in line circumferentially of the wheel, the members having flanges to surround the blocks to prevent their displacement, and a boss on one of the members to extend part way between the blocks.

896,375. Starter for Explosion Engines in Self Propelled Vehicles. Delamere B. Gardner, Chicago, Ill. Filed Oct. 5, 1907. Serial No. 396,064.

1. The combination with a driving shaft having operative connection with an internal combustion engine and a driven shaft adapted to be connected to and disconnected from said driving shaft, of means for absorbing the momentum of said driven shaft and the parts connected therewith and storing the energy thereof while the driven shaft is disconnected from the engine, and means for transmitting such stored energy to said driving shaft to start the engine.

896,388. Carburetter. Kirk G. Johnston, New York, N. Y. Filed Aug. 12, 1907. Serial No. 388,151.

1. In a carburetter, an air lifted needle valve, a longitudinally movable guide for said needle valve stem, an adjustable stop for said needle valve stem in the said guide, and a lever attached to said movable guide and adapted to move same longitudinally varying amounts as and for the purpose set forth.

896,389. Friction Clutch. Kirk G. Johnston, New York, N. Y. Filed August 12, 1907. Serial No. 388,152.

1. In a friction clutch the combination of a driving member, upon the face of which are constructed a plurality of circularly disposed concentric cones; a pin or pivot projecting from the center of said driving member; a driven member, upon the face of which are constructed a plurality of circularly disposed concentric cones adapted to fit into the spaces between the similar cones on the said driving member, slidably mounted on the said pin; a pin or shaft projecting from the center of said driven member, and rigidly attached thereto; a plate member hermetically attached to the rim of the said driving member, and journaled on the projecting shaft from the said driven member, thus forming an oil-tight casing for the said members; and means of sliding the shaft projecting from the said driven member, thus engaging or disengaging the said members, substantially as and for the purpose set forth.

896,398. Incandescent Igniter for Gas Engines. James S. Lang, Boston, Mass. Filed June 9, 1905. Serial No. 264,443.

In an engine of the character specified having a combustion chamber, a gas inlet and exhaust passage, an igniter contained in said exhaust passage, a damper or check in said gas inlet passage, a spindle on which said damper or check is mounted, a lever fulcrumed upon said spindle and fixed thereto, and means connecting said lever with said igniter.

896,451. Safety Clutch for Starting Gas Engines. Walter S. Jones, Plainville, Conn. Filed Aug. 30, 1905. Serial No. 276,464.

1. In a starting device for motors, the combination of a starting shaft with a pair of clutch members for driving the said shaft forwardly, a starting crank connected with one of the said clutch members, a cylindrical friction surface for rotating forwardly with the said shaft, a tubular friction device mounted on the said cylindrical friction surface for carrying the shaft forwardly with the crank against a given load and then permitting the shaft to stop or turn backwardly without the crank, and means for continually binding the said tubular friction device upon the said cylindrical friction surface, to regulate the degree of frction that is constantly exerted thereby.

896,455. Exhaust and Signal Control. Jonathan D. Maxwell, Tarrytown, N. Y. Filed Aug. 23, 1907. Serial No. 389,793.

1. An exhaust and signal control, comprising a muffler having a direct and an indirect outlet adapted to maintain a constant back pressure in its contents, when discharging through the indirect outlet, a signaling means and means adapted to operatively connect the indirect outlet and signaling means, and to close either the direct or indirect outlet independently of the signal.

896,559. Air Inlet Regulator for Carburetters. Adele A. Longuemare, Paris, France. Filed May 27, 1904. Serial No. 210,100.

1. In an automatic air inlet regulator for carburetters the combination with a casing, a perforated cover closing one end of said casing, and a perforated fixed disc in said casing and parallel and adjacent to said cover, of a correspondingly perforated non-rotatable disc of a diameter equal to that of the interior of the casing and seated directly upon and parallel but relatively movable to said fixed disc, the solid portions of the movable disc covering and closing the perforations of the fixed disc and vice versa, a spring for pressing the movable disc upon the fixed disc, means for preventing lateral motion of the movable disc relatively to the fixed disc and a suction pipe connection between the casing and the motor, so that the quantity of air which penetrates is regulated by the suction of the motor acting on the upper surface of the movable disc to separate the two discs more or less from each other, substantially as set forth.

896,606. Automobile Horn. Robert Wright, Cleveland, Ohio. Filed Oct. 15, 1907. Serial No. 397,503.

1. A horn comprising a pipe having an opening in the side, a partition across the pipe forming a chamber in front of said opening and having an outlet thereto, a tongue slidable on the pipe, across said opening, the end of the tongue and the edge of the partition at the outlet being tooher.

896,624. Motor Vehicle. Walter Christie, New York, N. Y., assignor of one-half to W. Gould Brokaw, Archdale, N. C. Filed Feb. 12, 1908. Serial No. 415, 548.

1. In a motor vehicle, the combination with a hollow tubular cross casing provided with vertical bearing sleeves at opposite ends thereof and having rearwardly projecting lugs, bearing members having spindles fitted to the said vertical sleeves, wheels rotatably mounted upon said bearing members, a motor supported upon the said cross casing and transmission gearing including compensating means for connecting the said motor with the said wheels, of a main body portion including a frame work and a pair of rear wheels, the said frame work provided with forwardly projecting channel irons which are fitted to the rearwardly projecting lugs of the cross casing; and means for removably connecting the said lugs and channel irons together.

896,652. Gasolene Feed Chamber for Carburetters. Godfried J. Mayer, Buffalo, N. Y., assignor of five-twentieths to Donald R. Clark and four-twentieths to Herman Mayer, Buffalo, N. Y. Filed May 23, 1907. Serial No. 375,307.

1. A chamber having a cover removably threaded thereon and a lug on its outer face adjacent said cover, a spring bar secured at one end near the bottom of said chamber and having its other end extended above the cover and provided with an offset portion bearing against said cover, said bar being adapted to be sprung onto said lug to disengage said offset portion from the cover and hold it out of engagement.

896,661. Tire. William Porter, Los Angeles, Cal. Filed June 26, 1907. Serial No. 380,946.

A tire comprising a hollow ring formed from thin, perforated, wedge shaped pieces of material arranged radially and close together, each piece being cut out in the center and having its inner edge flat and provided with wings, the portion between said wings being separated by a wedge shaped opening extending from the central opening to the flat edge on a diagonal line extending across a line through the center of said piece substantially midway between said wings, a lining around within the tire having thin edges, one of which extends into the wedge shaped recesses of said pieces of material and the other extends across the joint between the other edge of the lining and the inner end of the severed wing portion, wire rings in the perforations of said pieces to bind them together, and an inflatable tube within the tire.

896,691. Change Speed Driving Gear. Arthur T. Collier, St. Albans, England, assignor of one-fifth to Harry Seymour Foster, London, England. Filed Aug. 20, 1907. Serial No. 389,412.

1. Change speed driving gear comprising a frame, a gear wheel rotatably mounted in said frame, worms gearing with said gear wheel and rotatably mounted in said frame, a shaft rotatably mounted adjacent to said frame, means for coupling said shaft to either of said worms, and means for bringing said frame into and securing it in the respective positions in which the several worms are coupled to sad shaft.

896,703. Vehicle Lamp. Charles Bergener, Rochester, N. Y., assignor to C. T. Hamm Manufacturing Company, Rochester, N. Y. Filed Sept. 13, 1907. Serial No. 392,625.

1. In a lamp or lantern, the combination of a flame chamber provided with a chimney, an upright wall surrounding said chimney and forming therewith descending air passage, an air chamber which incloses the upper portion of said wall and has a closed top which extends from said chimney outwardly over said wall, said air chamber being open at its lower end for the admission of air and said upright wall having within the upper portion of said air chamber a communication through which the air flowing upwardly through said chmber passes inwardly into said descending passage, and a deflector which is arranged around said surrounding wall below the open lower end of said air chamber and deflects the air up-

Digitized by Google

wardly into said chamber, substantially as set forth.

896,728. Thread Grip for Vehicle Tires. Carlton L. Hoff, York, Pa. Filed March 1, 1907. Serial No. 360,025.

1. A tread grip for vehicle tires embodying a plurality of substantially parallel tread chains extending longitudinally of the tire and formed of twisted links and straight links at spaced intervals, links connecting the straight links of adjacent chains, side chains and links connecting said side chains and edge tread chains at spaced intervals and formed of twisted links and links connecting adjacent chains formed with eyes twisted with relation to each other to engage the side bars of the twisted chain links at substantially right angles thereto.

896,739. Transmission Gearing. William C. Mayo and John Houlehan, El Paso, Tex., assignors of one-third to George E. Briggs, Barstow, Tex. Filed Sept. 5, 1907. Serial No. 391,525.

1. In a transmission gear, an annular gear wheel having an annular ball race on each face, a pinion meshing with the gear wheel, a casing inclosing the gear wheel and pinion and provided with an annular ball race corresponding to one of the ball races of the annular gear, a removable cover for the casing adjustably connected thereto, and an annular series of balls seated in the ball races on each side of the gear wheel and in the respective ball races on the inner faces of the casing and cover.

896,844. Steering Gear. Theophilus Mayhew, Detroit, Mich. Filed Jan. 2, 1908. Serial No. 408,979.

1. In a steering gear having a casing, a rotatable steering wheel shaft secured therein against longitudinal displacement, and a nut for operating a steering knuckle longitudinally reciprocable on the shaft, means yieldingly movable transversely to the shaft adapted to automatically maintain constant endwise pressure on the nut and on the shaft.

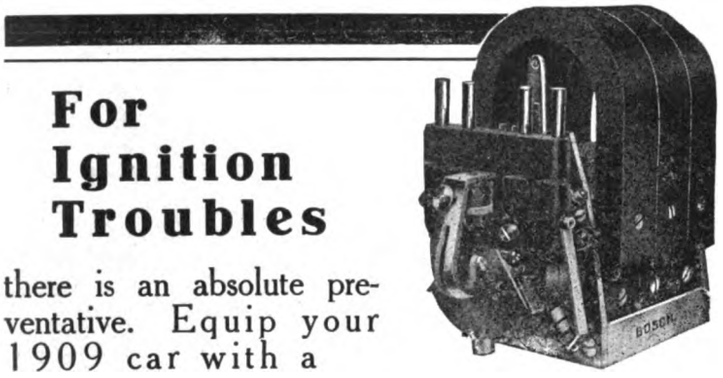
896,850. Puncture Closing Device. Stanley Mundey, London, England. Filed Sept. 30, 1907. Serial No. 395,273.

1. A puncture closing device for air chambers comprising in combination a flexible plug having a reduced neck portion and an extensible ring adapted to surround said neck portion to grip air chamber material between itself and said neck.

896,863. Canopy Top for Vehicles. John E. Smith, Atlanta, Ga. Filed March 23, 1908. Serial No. 422,666.

1. The combination with a vehicle body of a rigid, non-foldable top; means for flexibly supporting the top upon the body; and means for limiting the movements of the top relative to the body.

896,897. Vehicle Wheel. Herman Cramer, San Francisco, Cal. Filed Dec. 13, 1905. Serial No. 291,590. Renewed May 27, 1908. Serial No. 435,254.



1. In a vehicle wheel, a socket at the outer end of each spoke, a block of rubber in each cocket provided with a tapering perforation, a tire surrounding the wheel, and inwardly extending tapering projections on the tire for entering said perforations.

897,023. Packing for Gas Engine Valve Stems. Alexander K. Schaap, New York, N. Y., assignor to Eva C. Schaap, Brooklyn, N. Y., doing business as Schaap Automobile Company, a Firm. Filed Aug. 8, 1907. Serial No. 387,620.

1. The combination with a four cycle gas engine valve stem and guide, of a packing device encircling the stem and engaging the end of the guide to effect a hermetic connection, and means for pressing said packing yieldingly into active position, such means applying increased pressure during the opening of the inlet valve.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

For Ignition Troubles

there is an absolute preventative. Equip your 1909 car with a

BOSCH MAGNETO

and ignition troubles cease. The Bosch is recognized throughout the world as standard. The Bosch is to be found on the winning car in practically every great racing event.

The Bosch is chosen and used by manufacturers, race-drivers and owners who desire the best ignition system obtainable.

The MAGNETO It's FUN TO OWN

U&H

UNTERBERG & HELMLE

UNTERBERG & HELMLE

With or Without the Self-Starting Device

the Unterberg & Helmle Magneto presents the same features in respect to the interrupter, condenser, distributor, and general design.

The two interrupter cams in the bronze ring P are made of steel. The "roller" of the interrupter contact is not really a roller at all, but a fibre sleeve which does not turn; consequently the cams cannot wear unequally as they might if made of fibre, and the "roller" cannot miss contact occasionally when a flat spot is worn, as it would if it were allowed to turn on its pin. The U. & H. Magneto cannot help operating in perfect synchronism.

By turning a spring clip, the cover X is removed from the hard rubber distributor housing W to clean the distributor segments.

If the quarters are cramped, the interrupter barrel Q can be taken out bodily for adjustment by removing one screw R.

Type LE—the SELF-STARTING Magneto.
Type LB—without the self-starting device.
Other types for special uses.

STEVENS-DURYEA Touring Cars

WHAT concerns you is not the size of the engine nor the horsepower the maker claims for it. You are only interested in the results—hill climbing—road speed—power in sand, etc.

We have said a lot at various times about getting a greater proportion of the engine horsepower delivered to the rear wheels of the Stevens-Duryea than any other car. There never was anything easier to satisfy yourself about—a bit of sandy road—a stop-watch—the Stevens-Duryea's time vs. the other car's time—the size of the Stevens-Duryea engine vs. the size of the other.

TRY IT.

Send for Stevens-Duryea literature.

GOING UP!

HITTING THE HIGH SPOTS
IS ROYAL PASTIME IF YOUR
CAR IS EQUIPPED WITH

1909 Gabriel Shock Absorbers

¶ A retarding friction gradually applied in proportion to the shock takes up all jolts and jars and makes riding over rough roads as pleasant as on city pavements.

¶ Our 1909 model has improvements which give increased bearing surface, eliminate noise or rattle and greatly increase its effectiveness and durability. Can be attached to any car or type of spring. ¶ Write for catalog and prices.

GABRIEL HORN MFG. CO., 1417 E. 40th St. Cleveland, O.

SUPPLEMENTARY SPIRAL SPRINGS

¶ Cars are like men in that it takes a study of them to realize their possibilities.

¶ We have made a study of the spring question and can help you realize to the full the easy-riding possibilities of your car. The use of Supplementary Spiral Springs are a duty you owe to yourself. They provide spring insurance and spring comfort, effectually guarding against shocks to your pocketbook and passengers.

¶ Many thousands of the S. S. S. are in use by just as many satisfied users. Better be one of them NOW.

¶ Your dealer or garage can fit you out in a few hours' time.

Digitized by Google

1909 Model 40 H. P. Toy Tonneau, $3,000.

A Car For Live Agents To Handle

THERE are other cars on the market that apparently offer more for less money than the Haynes 40 H. P. model at $3000. But their lack of the Haynes steel alloys, the improper simplification of certain parts, the unwise short-cuts in manufacturing generally mean frequent visits to the repair shops.

There is a lot of time, money and patience wasted in small repair jobs of this kind.

Every Haynes owner has the satisfaction of knowing that his car will "stand-up."

And there are Haynes owners everywhere—that is the advantage that age gives us.

A "new one" in the industry has no long established clientele—no good will—no old friends. But the Haynes is the ***oldest American automobile,*** dating from 1893, when Elwood Haynes built the first gasolene horseless carriage in America.

And its friends in every state are legion. For the Haynes car "makes good." Look over the record of all the favorable Reliability and Endurance Runs, or Sealed Bonnet Contests and you'll find the Haynes always has a perfect score.

AGENTS WANTED

We have some desirable territory open this year for the right man. Write at once for particulars.

SPECIFICATIONS OF THE HAYNES FOR 1909

Motor—4 cylinder, 4¾ by 5.
Water Cooled, with very large water jacket.
Drive—Shaft drive, with Haynes roller-pinion and sprocket at the rear axle, which minimizes friction and side thrust and eliminates noise entirely.
Clutch—Haynes patent contracting steel band upon bronze drum.
Carburetor—Latest type Schebler, water jacketed.
Lubrication—Gear driven McCord oiler.
Ignition—Bosch Magneto; also battery system with single coil and separate set of plugs.
Bearing—Roller bearings used throughout.
Tires—36 by 4 all around.
Transmission—Selective type, three speeds forward and reverse. Ratchet device makes gear stripping impossible.
Wheel base—112 inches. Tread—56 inches.
Body—Touring car for five or seven, or toy Tonneau, $3,000. Runabout or Hiker type, $2900.
The Hiker type consists of two bucket seats with large gasoline tank on rear. Equipment includes Prest-O-Lite tank, baggage rack and tire holders.

Digitized by Google

The Warner Instrument Co.
of Beloit, Wis.

Announce their Masterpiece—

The 1909 AUTO-METER

The illustration shows the form of the new instrument. The chaste simplicity and artistic beauty of the design is self-evident. It harmonizes perfectly with other dash equipment and gives tone to any car.

The Speed Recording mechanism is unchanged. It was perfection before. Improvement was impossible.

The Odometer is now of our own construction. Therefore, as simple, durable and dependable as the Auto-Meter itself. The figures are so large and distinct that they can be read from the seat.

The Season dial registers 100,000 miles. Other odometers register 10,000 miles only.

The Trip dial registers 1,000 miles. Other odometers register 100 miles only.

The Trip dial-set is simplified. A single turn of the button resets to zero.

Those who have used any kind of Speed Indicator will realize what these points mean to them.

The entire dial is illuminated by concealed electric bulb. The pressure of a button makes speed and distance plainly readable in the darkest night.

The Shaft Drive is now made simpler and stronger than ever before. We use special steel, heat treated, in its construction. This was really not required. We have seldom had shaft or other troubles not caused by carelessness or accident. We changed simply because modern methods had produced something better than we had used before.

The Auto-Meter is constructed throughout of the best materials procurable. It is made and put together by the same workmen who are engaged in making Chronometers and other expensive instruments of precision.

The tests and inspection of each instrument is so rigid that variations from absolute accuracy are only possible when there are variations in tire diameters. This amounts, on the average, to less than 100 feet to the mile.

For these reasons the Warner Auto-Meter has always been specified by those who can afford ***the best,*** and with whom anything short of absolute perfection and unfailing accuracy is of no use whatever.

The Value of the AJAX 5,000 Mile Guarantee

is known and appreciated by every individual **AJAX** user. It also finds substantial recognition at the hands of the automobile manufacturer who knows better than any one how vital the tire problem is to the motorist.

No wonder, then, that careful buyers and conservative manufacturers like the **Maxwell-Briscoe Motor Comapny** give to the **AJAX** the largest tire order ever received by a single tire firm.

Incidentally they give to their customers the benefit of the **AJAX five-thousand mile guarantee**, which insures the user against tire worry and gives him a security that no other tire maker can afford.

MORGAN & WRIGHT TIRES

Are Strong At Every Point

The fabric used is given the most rigid tests to avoid the possibility of weak spots.

In building the tire, special stress is laid upon the care that shall be given to details (every tire builder is required to put his mark on tires made by him as a check against careless work).

And the curing process employed by us guarantees an even cure, leaving no overcured places to crack after the tire has run a few miles.

There is no method of making friends equal to the method of making good.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, December 3, 1908. No. 10

MAKERS POOL PATENTS ON COILS

Holding Company Formed to Issue Licenses and Prosecute Infringements—Action Follows Litigation.

Claiming to hold basic patents affecting certain valuable features of spark coil construction, a holding and licensing company has been formed which proposes to assert its position in the field and to force all the makers and importers of coils in the United States to pay tribute either in license fees or infringement recoveries, where their devices come within the scope of the letters patent which it has acquired. The formation of the new corporation, which is to be known as the Unit Coil Co. and which will have its headquarters at 15 Exchange place, Jersey City, N. J., follows the amicable settlement of an infringement fight between the Autocoil Co., of Jersey City, and the Connecticut Telephone and Electric Co., of Meriden, Conn.

As a means of compromising the litigation, the patents involved have been turned over to the new company, and in the future both the Autocoil Co. and the Connecticut company will operate under license from the Unit Coil Co. Of the patents which the latter now holds, and under which it will act, the most important are No. 878,435, of February 4, 1908, to Richard Varley, and No. 884,116, of April 7, 1908, to E. Q. Williams. These patents, it is declared, "cover every practical form of removable unit induction coil," and the immediate prosecution of unlicensed manufacturers, users, and vendors is threatened.

Royal Plant Bought by New Company.

Transfer of the business, plant and good will of the Royal Motor Car Co., of Cleveland, O., has been made to a newly organized company, which will be known as the Royal Tourist Car Co., and which will continue to make the Royal Tourist cars. Judge Taylor, of the United States District Court, at Cleveland, granted the necessary sanction on Tuesday, permitting the receivers to complete the transaction. The officers of the new company include George J. Dunham, of Boston, president; N. E. Calhoun, of Cleveland, vice-president and treasurer, and Clifford Fuller, of Cleveland, secretary.

Glover New President of Corbin.

Having resigned as president of the Corbin Motor Vehicle Corporation, Howard S. Hart has been succeeded by President Charles Glover, of the Corbin Screw Corporation, of New Britain, Conn. The latter does not relinquish the presidency of the Corbin Screw Corporation in assuming his new duties, but it is expected that his energy and initiative, which have contributed so much to the success of the Screw company, will give a new impetus to the production of Corbin cars. In addition to great business experience and his proved executive ability in large affairs, Glover is prolific in inventive and mechanical genius, a large part of the machinery used by the Corbin Screw Corporation being of his origination. Both the design and the manufacturing methods employed in connection with the Corbin models will hereafter be benefitted by his knowledge.

Peerless to Build on Broadway.

Property for its New York City branch has been purchased by the Peerless Motor Car Co., of Cleveland, O., on upper Broadway. The site is of L shape, having a Broadway frontage of 70 feet, abutting that of the Baptist Tabernacle, on Fifty-sixth street. The extension gives a 25-foot outlet on Fifty-seventh street. An eight story fireproof building will be erected.

Hadley Resigns from Garford.

C. E. Hadley has resigned as general manager of the Garford Company, of Elyria, O. No successor will be appointed to the position, as the Studebaker Automobile Co., of South Bend, Ind., is now marketing the entire output. A. L. Garford will assume full control of the producing end.

HERRESHOFF PLANS ANNOUNCED

Output Will be Sold Only in the East—Mechanical Features of the New Cars are Disclosed.

Confirming the Motor World's exclusive report of the selling arrangements for the new Herreshoff Motor Co., of Detroit, Mich., it is announced that Harry S. Houpt, distinct from his relations with the Harry S. Houpt Co., of New York City, has signed a contract by which he will take the entire output of the Herreshoff cars, which are to appear about the first of January. For the coming season Houpt will place the output almost entirely in the East, and is at present arranging agencies in the Eastern cities. Not until 1910 will Western agencies be placed, by which time the output will be greatly increased.

The new car, designed by Charles F. Herreshoff, has a unit power plant incorporating the engine, fly wheel, clutch, and three-speed progressive change gear in one combination. Three-point suspension is featured, and the drive to the full floating rear axle is by tubular shaft, enclosed in a torque tube. The four cylinder engine features larve valves and has a set spark with both magneto and battery high tension ignition. Its speed is from 200 to 2,400 r.p.m., delivering 24 horsepower at the rear wheels. The weight is 1,600 pounds. Semi-elliptic springs are used in front and back, and the wheels carry 32x3½-inch tires. The standard type will sell for $1,500, but all types of body will be supplied.

Shawmut Seeks Plant in Reading.

The Shawmut Motor Co., of Stoneham, Mass., whose plant was destroyed by fire, is negotiating with the Business Men's Association of Reading, Mass., with a view to removing to that town. A suitable plant in Reading is at present idle, and if satisfactory terms can be arranged the Shawmut company will acquire it.

FEW GAINS IN EXPORT MARKETS

Showing for October Reveals a Decline in Outward Shipments—The Record for Ten Months.

As an offset to Italian racing victories, the American makers are winning a modest commercial victory in Italy, according to the October export record, the shipments of American machines to that country having increased for the month to ten times what it was in the corresponding month last year. Gains are also indicated in British North America, the West Indies and Bermuda, Other Europe, and in Africa. The trade with Germany is practically the same as in October a year ago, while the remainder of the divisions all record losses. The month's showing discloses a serious falling off in the traffic with the United Kingdom, from $118,470 to $63,595, and France drops from $29,199 to $5,531. A decline from $23,865 to $3,519 occurs in the exports to South America, and Mexico registers a diminution from $44,772 to $30,366. The total of business for the month amounts to $213,775 as against $318,103 for October, 1907.

For the ten months ending with October the total is $2,296,503, as against $5,281,988 for the same period last year. Only two divisions show gains for the whole period. Other Asia and Oceania being credited with an increase from $77,514 to $115,097, and the division known as Other Countries showing a gain from $11,400 to $20,702. The remaining twelve divisions record losses, the most radical being those of Mexico, the West Indies and Bermuda, South America, and British Australasia. Holding its position of the largest single customer, the United Kingdom bought to the amount of $1,605,075 as against $1,622,261 during the ten months of 1907.

The record in detail is as follows:

	October		Ten Months Ending October		
	1907	1908	1906	1907	1908

* Figures are for six months, January to June, 1906. † Number not stated prior to July 1, 1906. ‡ Figures are for July to October, 1906, inclusive.

Elliott's Illness Results Fatally.

One of five well known men in the automobile industry to be stricken with typhoid fever at about the same time, following a lunch a few weeks ago at a New York hotel, A. B. Elliott, treasurer of the Witherbee Igniter Co., of New York City, succumbed to the malady on the 26th ult. His untimely death cuts short a most promising career. Educated at the University of Virginia, he became a graduate electrician from the training school of the General Electric Co., following which he was for a time in part charge of the electrification of the New York Central railroad's lines in New York City. This work he left, to engage in the field of gas engine ignition, and under his direction the development of the Witherbee specialties has been carried out. He was thirty-five years old, and had been married about a year.

Four of his companions at the lunch in question were taken with typhoid, and are confined with it at present. The list includes T. J. Wetzel, L. A. Hopkins, Herbert Lytle and John B. Rowland.

Tilden and Graham go to Prison.

Following the conviction of conspiracy in having promoted the Steel Ball Co., of Chicago, Ill., by means of fictitious notes of the Milwaukee Avenue State Bank, two officials of the company, William L. Tilden and Chauncey L. Graham, were sentenced, on the 27th ult. to a term of from one to twenty years in the penitentiary. The sensational failure of the bank exposed their flotation of $175,000 worth of the notes. The Steel Ball Co. was at one time prominent in introducing the Hill precision oiler.

Apperson Accepts Plans for Addition.

The Apperson Bros. Automobile Co., of Kokomo, Ind., has accepted plans for the construction of a large, three story building, which will add 50 per cent. to the factory floor space. Sales Manager Strout has doubled the number of Apperson dealers, and an increase is necessary.

ELECTRIC VEHICLE TO CONTINUE

Receivers Granted Permission to Manufacture for the Coming Season—Reorganization Plans Progressing.

Permission for the receivers of the Electric Vehicle Co., of Hartford, Conn., to continue the business of the concern until July 1, 1909, has been granted by Judge Lanning, of the United States Circuit Court, sitting at Trenton, N. J. The order permits the manufacture of 200 gasolene cars and 50 electric phaetons, on which Halsey M. Barrett and Henry W. Nuckols, the receivers, estimate a profit of $70,000. In their petition the receivers intimate that considerable progress has been made toward a reorganization, it being hoped that the unsecured creditors will assign their claims for 25 cents on the dollar. A majority of the creditors in this class, it is said, have agreed on this figure.

A financial statement accompanying the report to the court shows receipts from July 20, 1908, to November 24, to have been, including cash on hand at the first date, $427,339.86, and the total disbursements for the same period to have been $272,502.79, leaving a balance in banks amounting to $154,837.07. In addition to this balance the report says that there should be added about $20,000 in the hands of the receivers in Illinois, $8,000 in the hands of the New York receivers and $5,000 with the Massachusetts receivers, making in all a balance of $188,000 in round numbers. A large addition will be made to the balance, it is said, as soon as cars now under construction are sold.

Syracuse Aluminum not Burned Out.

Like the reports of Mark Twain's death, which he declared to be "greatly exaggerated," the account of the fire at the plant of the Syracuse Aluminum and Bronze Co., of Syracuse, N. Y., which appeared recently, overstated the case in indicating an almost total destruction of the buildings. Though threatening the foundry and causing a removal of all the patterns and many of the machines to places of safety, the flames were confined to the offices, where the furniture and many of the company's records were consumed. The plant itself is again in full operation.

Yule to Become a Racine Director.

When the reorganization of the Pope Mfg. Co. is effected and he receives his discharge as one of the receivers, George A. Yule will become a director and manager of the Racine Wagon & Carriage Co., a big $4,000,000 concern located in Racine, Wis., near the Mitchell Motor Car Co.'s works. Mr. Yule already has retired from the Bain Wagon Co., of which he was the directing head for many years.

IMPORTERS WANT LOWER TARIFF

Their Demand Presented to the Ways and Means Committee—What American Makers Say in Opposition.

Pleading for a reduction in the tariff on imported automobiles from the present rate of 45 per cent. ad valorem to 30 per cent., Charles M. Sherrill, of New York City, representing the Importers' Automobile Salon, appeared before the Ways and Means Committee of Congress at Washington, on Friday last, 27th ult., in an effort to secure more advantageous conditions for the dealers in foreign machines. The importers' brief for lower tariff was presented in the course of a series of hearings which are being held in an effort to secure data for the framing of a bill for tariff revision to be reported from the committee. The session was the last of the hearings on the metal schedule, and though the subject of the automobile tariff is to be discussed fully at a later hearing, Sherill took advantage of the opportunity to present the importers' case. None of the associations of the American manufacturers was represented by counsel, but the importers' demand was emphasized by a telegram from Edward Denby, said to represent the Ford interests, which expressed opposition to an expected increase in the duty.

Counsel for the importers was in an aggressive frame of mind and made no bones about asserting that the American industry is in the hands of a trust, or, in his own words: "Instead of an 'infant industry' which is seeking protection at the hands of your honorable committe, it could more properly be called a trust." He credited the "trust" with an annual profit of 100 per cent.

"The American manufacturers of automobiles are divided into two large groups," he declared, "one the Association of Licensed Automobile Manufacturers, which is organized about the so-called Selden patents and the other the American Motor Car Manufacturers Association which does not own allegiance to the Selden patents. The Selden patent is an ingenious device to maintain a high price for automobiles among the manufacturers using the patent. Up till now all attempts to break this trust have failed because its foundation is a 'United States patent' which is a monopoly granted by the government."

The specific request was for a reduction in the duty from 45 per cent. to 30 per cent. ad valorem, claiming that the manufacture of foreign automobiles involved the use of much American machinery, besides bringing large amounts of business to the American carriage builders who, he said, make 90 per cent. of the bodies for foreign motor cars. All tires, too, he declared, were of American manufacture, while insurance and office work were all contributions to the "sphere of energy," of native Americans.

Though not actively represented at the hearing, the American manufacturers' interests are being cared for by the Motor Car Manufacturers' Tariff Commission, which is composed of the following representatives delegated by the Association of Licensed Automobile Manufacturers, the American Motor Car Manufacturers' Association and the National Association of Automobile Manufacturers: H. B. Joy, Packard Motor Car Company, Detroit, Mich.; A. L. Riker, Locomobile Company, Bridgeport, Conn.; L. H. Kittredge, Peerless Motor Car Company, Cleveland, Ohio; C. H. Stillwell, Franklin Motor Car Company, Syracuse, N. Y.; E. R. Thomas, Buffalo, N. Y.; R. E. Olds, Lansing, Mich., and Thomas Henderson, Winton Motor Car Company, Cleveland, Ohio.

In response to a notification of a hearing to be held on the subject of tariff revision as it affects the motor car industry in America, the commission has submitted a brief to the Ways and Means Committee, in which the relative conditions affecting the makers here and abroad are set forth at length. As showing the importance in American commerce of the companies directly represnted by the joint commission, it is prefaced by the statement that the market value of their products for the current fiscal year will exceed $37,500,000.

"These Companies represent on their pay rolls to-day 11,400 employees directly paid by them and at work within the four walls of the respective companies," continues the brief, "this is not taking into consideration the number of employees directly engaged in work being done for these companies outside of their own factories nor does it take into consideration the millions and millons of dollars' worth of material being purchased by these companies from American sources of supply. A further matter of interest might be that the direct aggregate of pay rolls of the companies represented by the gentlemen present is approximately $700,000 per month paid to American workmen. I merely state these facts as indicative of the importance to be attached by the committee to our industry, and these statistics refer only to the companies of those gentlemen present.

"The extent of the motor car industry at the present time is 253 manufacturers of motor vehicles, of which about 70 to 100 are marketing a product that is of importance to the trade. The value of the total American product for the year 1907 we place according to our best figures at upward of $100,000,000.

"The motor-car industry is in process of rapid development, as witnessed by the fact that this enormous industry has grown up in America in the past ten years. Motor cars for import now come under the Dingley tariff bill, Schedule C, paragraph 193, act of 1897—manufacturers of metal n. s. p. f.

"We specially and earnestly urge upon your committee a special separate classification for motor vehicles and parts thereof, account of the extent and importance of the Motor car industry, which did not exist when the Dingley tariff bill was enacted. It is essential that equitable and adequate tariff protection for our product be provided, owing to the existing conditions in Europe, where very large factories have already more than supplied the European demand and which now finds the foreign market overcrowded, and on account of this overproduction are making strenuous efforts to market their excess product in America by the reduction of prices for exportation and making special discounts, availing themselves of the so-called 'German concessions.' The tariff necessarily, in order to be a protection, must compensate for the difference in the cost of production in this country and Europe. the principal item of which is wages.

"It is to be specially noted that under the existing tariff the volume of imports of motor-cars has annually increased, though statistics show that the value has decreased yearly on account of reduced prices abroad and American competition, yet the number of cars imported has increased each year and we wish to call particularly to the attention of your committee the strenuous efforts on the part of various manufacturers to introduce their goods into the American market—Racing, advertising, branch houses.

"Reduction in prices, undervaluations, special discounts, and every means which can be devised are being, and will be, used to unload on the American market the excess product of Europe produced on the low European wage basis. The only means left to the American manufacturer to offset a reduction of the tariff and increased imports is reduction of wages, contests with our employees, and all the attendant tribulatoins, which we are seeking to avoid.

"Further, it is clear that if the tarim were to be reduced on motor-cars, making in any degree the importation of them more easy, it would necessarily follow that the tariff on component materials comprising tremendous varieties of industries in this country would also have to be reduced."

Figures showing the important bearing of the wage question upon the relative costs of production of American and foreign built cars were presented thus:

"In eight of the leading and important American factories, employing 11,400 men, the average pay per year per person is as follows:

"Workmen, $755.05; commercial employees, $876.07; technical employees, $1.202.41.

"We have also the data covering the same information giving an average of 34 factories in Europe, employing 10,347 men. The average pay per year per person is:

Digitized by Google

"Workmen, $306; technical employees, $602.50; commercial employees, $529; showing that the workmen in American factories are paid 2½ times approximately what they get for the same work in the same kind of factories in Europe. Technical employees in the American factories receive approximately twice what they do in Europe, and commercial employees receive about 2¼ times what they do in Europe. As a check on these figures compiled by our home factories it is to be noted that the statistical data gathered by Mr. James M. Carples, who has been abroad gathering data on the subject of rates of wages for us, exactly substantiate the above figures."

Comparing the relative wages in cents per hour by various artizans in France, Austria and Italy, Belgium and America, the data shows that Blacksmiths receive 11, 8½, 10 and 28 cents per hour, respectively; machinists, 9½, 6½, 10 and 25.8; and assemblers, 11 and 9 cents in the first two territories named, while in America they receive an average of 24.6 cents. Pattern makers receive 12 and 10 cents in France, Austria and Italy, as against 31.9 cents in America. The same comparison applied to the earnings of electricians gives the figures, 12, 7 and 25 cents, while carpenters receive 12 cents in France, 6 in Belgium and 33.4 in America. The European apprentice system gives to the French manufacturers from 2½ to 3 years of labor at no pay, while the makers of Austria and Italy are obliged to give half pay for the two-year periods of tuition.

Early this week the Motor World addressed a score of well-known American automobile manufacturers with this request:

What is your opinion of proposed reduction in tariff to 30 per cent. urged by Importers at Washington? Do you favor any reduction?

Half of those reached hastened to place themselves on record, expressions of opinion being almost unanimously in the negative, though in some instances subject to qualification. The gist of some of the replies follows:

Thomas B. Jeffery & Co.—"We do not favor reduction in tariff on automobiles The time is not right nor the industry in condition to meet any such change."

Pope Manufacturing Co.—"We highly approve retention of at least 45 per cent. duty on motor cars and parts."

National Motor Vehicle Co.—"We are not in favor of any reduction in tariffs on automobiles."

Premier Motor Manufacturing Co.—"Believe present tariff of automobiles satisfactory and any change undesirable."

Believing that the prices asked for their product would place them beyond the range of foreign competition in the event of a reduction, a firm which requested that its name be withheld expressed a leaning toward such a change, since if it were extended to certain parts, their own costs would be reduced. For the general good of the industry, however, they stand for the retention of the present tariff.

Palmer & Singer Mfg. Co.—"I think it would be a great mistake to reduce the tariff on automobiles imported into this country. Of course, it would not affect the cheaper grades of cars to any extent, but the best American cars would be affected materially and a reduction would put many of our American manufacturers out of business."

Maxwell-Briscoe Motor Co.—"Under the present conditions the duty on foreign automobiles merely corresponds to the duty levied on raw materials, and it forms a much-needed protection to the American manufacturer as well as to his workmen. The danger of an injudicial reduction of the tariff is that the foreigner will utilize the American market as a dumping ground for the surplus of his cheaply-produced cars. As a matter of fact, the foreign manufacturers are selling their cars in this country now at cost or only slightly above cost, and the American maker's only protection for his industry is the 45 per cent. duty. It would be manifestly unfair to favor the foreign manufacturer with a reduction of duty on his finished product while at the same time retaining the rates imposed on unfinished material used by the domestic manufacturer, because the American maker is unable to obtain his labor at the low figures that are a rule in European factories. Unless the American manufacturer benefits by a commensurate protection, he would be forced to go out of business."

E. R. Thomas Co.—"Do not think it advisable."

The George N. Pierce Co.—"The leading foreign automobile manufacturers have equipped their plants with American made, modern labor-saving machinery and devices. With skilled labor at one-half or one-third the rates paid here and with the present duty against them, the foreign makers are able to compete in this market, as the yearly increasing imports of foreign made automobiles shows. Under these conditions it is plain that a further reduction in tariff would mean increased imports of foreign made cars and reduced production by American manufacturers, ultimately resulting in a lowering of the scale of wages paid for labor and a reduction in the number of workers employed. These conditions justify our opposition to any reduction of the present rate of duties on automobiles."

Dayton Motor Car Co.—"We are in favor of having it remain just where it is."

Studebaker Automobile Co.—"We are decidedly opposed to it. The automobile business in this country is practically a new industry and many millions of dollars have been invested in it. Such a proposed reduction in the tariff would not only retard growth but come pretty near ruining it. This is one of the businesses which needs the protecting help of the tariff."

Brush Runabout Co.—"At the present time it is only the higher priced cars that are in danger of foreign competition and people who buy this type of car use it as a luxury and can afford to pay a liberal duty if they choose to have a foreign name plate on their car. The only people the retention of duty affects is those who can amply afford it. In view of the above we do not favor any reduction whatever."

Program for A. M. C. M. A. Show Week.

Announcement was made last week of the program for the show week of Dec. 31st-Jan. 7th, which is to include besides the usual meetings of the various trade and other organizations, several special "nights" on which the Show Committee of the American Motor Car Manufactures' Association will make special provision for the entertainment of certain specified classes of visitors. As in previous years, "Society Night" will be the chief occasion for sartorial adornment, while the designation of the opening "Gala Night," which is usually given over chiefly to the chauffeurs and their lady friends, is sufficiently suggestive in itself. The full program for the week is as follows:

Thursday, December 31st, 10 A. M. Meeting, Show Committee, A. M. C. M. A.; 3 P. M., Private view of automobile show; Meeting, Executive Committee, New York Automobile Trade Association; 8 P. M., "Gala Night."

Friday, January 1st, Army and Navy Night.

Saturday, January 2nd, Students' night; 10:30 P. M., Show smoker to visiting motorists and dealers at A. C. A. Clubhouse.

Monday, January 4th, 2 P. M., Executive Committee meeting, American Automobile Association; Engineers' night.

Tuesday, January 5, 10 A. M., Executive Committee meeting, National Retail Automobile Dealers' Association; 4 P. M., Meeting, Board of Governors, Automobile Club of America; 1 P. M., Show luncheon to exhibitors by A. M. C. M. A., Hotel Manhattan; Meeting, Society of Automobile Engineers; Society night.

Wednesday, January 6th, 10 A. M., Meeting of Committee of Management, A. M. C. M. A.; 8 P. M., Meeting, Board of Directors, Importers Automobile Salon; Executive Committee meeting, Motor and Accessory Manufacturers; Merchants' night.

Thursday, January 7th, Executive Committee meeting, American Motor League; Municipal night.

Detroit on Eve of Show Warfare.

Show warfare is promised in Detroit, Mich., both the Tri-State Automobile & Sportsmen's Association and the Detroit Automobile Dealers Association having fixed upon dates for rival exhibitions. The former plan to hold theirs at the Light Guard Armory during the week of January 25, while the "Da-Da" show is scheduled for the week of February 15.

EXHIBITORS AT THE PALACE SHOW

Official List of 263 Displays of Cars, Parts and Accessories—Aeronautic Exhibits Completely Crowded Out.

Official announcement last week of the list of exhibitors at the first of the New York shows, to be held in Grand Central Palace during the week of Dec. 31st-Jan. 7th, revealed a total of 263 displays of cars, parts and accessories, which was lower than had been anticipated. Of these 75 will be the exhibits of manufacturers of complete vehicles of one sort or another, while 188 stands will be given over to the exhibition of parts and accessories. The foreign contingent will consist of 10 importers or agents for the over-seas manufacturers. So great has been the demand for space that the Show Committee has been forced to requisition the area formerly occupied by the Aero Club in order to provide accommodation for the entire aggregation. The complete list of exhibitors is as follows:

Vehicle Exhibitors.

Acme Motor Car Co.
American Motor Car Co.
Austin Automobile Co.
Atlas Motor Car Co.
Anderson Carriage Mfg. Co.
American Motor Truck Co.
Chadwick Engineering Works.
Brush Runabout Co.
Buckeye Mfg. Co.
Benner Motor Car Co.
Black Mfg. Co.
Bristol Engineering Co.
Brewster & Co.
Chadwick Engineering Co.
Cameron Motor Co.
C. G. V. Import Co.
Coates-Goshen Automobile Co.
Cleveland Autocab Co.
Commercial Truck Company of America.
De Luxe Motor Car Co.
Dayton Motor Car Co.
De Dion Bouton Selling Branch.
De Dietrich Import Co.
Delahaye Import Co.
Ford Motor Co.
Fiat Motor Co.
Gaeth Automobile Co.
Grabowsky Power Wagon Co.
Gramm-Logan Motor Car Co.
Gyroscope Automobile Co.
Holsman Automobile Co.
Hotchkiss Import Co.
Hart-Kraft Motor Co.
Inter-State Automobile Co.
Isotta Import Co.
Jackson Automobile Co.
Kiblinger, W. H., Co.
Kissel Motor Car Co.
Lancia Import Co.
Lane Motor Vehicle Co.
Lansden Co., The.
Mack Brothers Motor Car Co.
Marion Motor Car Co.
Maxwell-Briscoe Motor Co.
Midland Motor Co.
Mitchell Motor Car Co.
Moline Automobile Co.
Moon Motor Car Co.
Mora Motor Car Co.
McCue Co., The.
Middleby Auto Co.
National Motor Vehicle Co.
Nordyke & Marmon Co.
Oakland Motor Car Co.
Overland Auto Co.
Omar Motor Co.
Owens Co., R. M.
Pennsylvania Auto-Motor Co.
Pittsburg Motor Vehicle Co.
Panhard & Levassor.
Palais de l'Automobile.
Premier Motor Mfg. Co.
Regal Motor Car Co.
Reliable Dayton Motor Car Co.
Reo Motor Car Co.
Rapid Motor Vehicle Co.
Reliance Motor Truck Co.
Renault Freres Selling Agency.
Simplex Motor Car Co.
Speedwell Motor Car Co.
Schacht Mfg. Co.
Sultan Motor Co.
Welch Motor Car Co.
Wayne Works.
York Motor Car Co.

Accessory Exhibitors on First Gallery (Members Motor and Accessory Manufacturers.)

Ajax-Grieg Rubber Co.
American Ball Bearing Co.
American Electrical Novelty Mfg. Co.
Atwater-Kent Mfg. Works.
Atwood-Castle Co.
Autocoil Co.
Auto Improvement Co.

WHITE WINS

Los Angeles to Phoenix Road Race

A brilliant victory was scored by the White Steamer in the recent stock-car race through the mountains and over the desert from Los Angeles, California, to Phoenix, Arizona. Once again the White demonstrated that in a stock-car competition and over roads such as exist in most parts of the country it is faster than any other type of machine. Such a contest as the Los Angeles-Phoenix race is far more significant than a race between specially built cars over specially selected and carefully prepared highways. This latest White victory indicates to the purchaser just what kind of service he may expect from the type of car which he can buy and over roads such as he will have to cover.

The White is the fastest car on give-and-take roads, not because it has the highest-powered engine, but because it delivers at the rear wheels a larger percentage of the power of the engine than any other type. Furthermore, that power is available under all conditions, whether running fast or slow, and no time is lost in shifting gears or in waiting for the engine to "pick up speed." In other words, under ordinary road conditions, the flexibility of the White engine will do what great power in other types of engines cannot do.

Write for circular describing the 1909 models.

Progress Toward Uniform Laws.

In the convention of governors, held in Boston early last week, is found one of the most encouraging symptoms of a popular awakening in directions toward which it is most necessary such an awakening should be directed which has yet been seen. Such a convention could not have existed without a sufficient groundwork of popular feeling to guarantee it the support of at least a courteous hearing. On this account its very existence must be held almost as much in esteem as the efforts at progress which it brought forth.

The movement for equalizing the legal measures of various states is one which is of particularly vital interest to the motorist not only because it touches directly his interests in the cause of the highway and the cause of automobile legislation, but also because it tends toward the effacement of that great variety in the popular attitude which is responsible for the differences in the enactments at present in force. Next to a universal law, the passage of uniform laws by the various states, with only such differences as local conditions demand, is most to be desired. The generalization resulting from any such movement must inevitably result in the suppression of abusive restrictions and the betterment of motoring conditions. Apart from the questions of speed limits, universal lights, state or federal aid, or any of the other measures advocated, the convention is creditable to New England as a step in an upward direction.

Development of the Farmer Market.

Though considerable stir is being made just now by the several "quantity producers" who lay claim to a good share of the "farmer market," in accounting for the distribution of their product there is, perhaps, more or less skepticism among outsiders as to the actual basis of the big rural demand for its fulfilment. That they are well founded, and furthermore that the farmer is not only recognized as being worth going after, but is being gone after in persistant and searching fashion is revealed in the extensive plans of campaign undertaken by the various selling organizations in the field.

These forces all have their own individual methods of attack, direct and indirect; their arrangements for seeking and convincing the individual buyer, all worked out according to a thoroughly consistent system. Furthermore these systems, though differing in detail agree pretty uniformly in the provision for direct supervision over the local agents by emissaries sent out directly from the chief of the organization. In more than one instance there is combined with this a system of field work which is calculated at once to reinforce the efforts of the local workers and also to gauge the success of their labors. The net result is a system by which practically every man within a prescribed territory who is either able to afford a car, or who "looks as though he might be," to quote the words of one sales manager, has been given an opportunity to invest in the modern substitute for the horse and wagon.

For example, the branch of one well-known manufacturer which has jurisdiction over a territory including some thirty-five counties is equipped with as many local agencies as can be secured, in addition to which the entire field is constantly being patrolled by four travelers whose business it is not simply to oversee the work of the agents, but also to search out possible customers for them. In doing this the "drummers" are in fact, continually scouring the country in search of prosperous looking farms. As soon as a place is discovered whose owner is known to have sufficient means to place him within the class of "prospects," or whose appearance is such as to warrant such an inference, some excuse is made to stop. The traveler inquires the way to the nearest town, begs to drink of water, buys a glass of milk, inspects the live stock or fodder and in any way possible engages the farmer in conversation. Before he leaves, his measure has been taken, perhaps even he has been given a demonstration under one pretext or another, and within a few days he receives a direct request for patronage from the local agent to whom his name has been turned over.

Not simply this, but the movement of crops, their volume and the influx of money in return for them are watched with zealous care, both with regard to quantity and distribution. In this way the location of prospective customers is assisted, while the profitable handling of the selling forces is managed to better advantage than were the canvass made on a more indiscriminate basis. The farmer market has been a vast and intangible thing hitherto, but while it is being exploited with direct and persistent methods such as these, it is developing at a rate which not only accounts for a number of very large outputs, but also accounts for a softening of the rural attitude toward motoring in a way otherwise inexplicable.

About the Importers' Demands.

There is no small element of human interest in the appearance of a representative of the Importers' Salon before the Ways and Means Committee at Washington last week in advocacy of a one-third reduction in the tariff on imported automobiles. It is indicative not merely of the straits in which the foreign makers find themselves just at present, but also of a recogntion among the importers themselves, if not of open acknowledgement of the fact that the status of the imported product has undergone an alteration in the United States such that it can no longer lay claim to the grand and lofty supremacy which served to exalt it for so long a time. For the proud and haughty importer of a year or two ago to be humbled to the point of seeking a large outlet for the small car is a change of face sufficiently marked in itself

Digitized by Google

to be noteworthy. Yet that is the real meaning of the present movement for tariff reduction.

After years of prosperity and plenty a period of decline set in which culminated in the downfall of several of the firms in New York City which had loomed large in the brave array of dealers in the foreign product. Happily, or unhappily, the period of business depression intervened just as matters were reaching a climax and obscured the real facts which were that the American market for the gilded importations was fast waning into nothingness. At the same time a counter movement set in in the growing use of imported cabs, so that the otherwise noticeable drop in actual importations has been bridged over by a perfect deluge of low and medium powered vehicles which though serving to preserve a respectable exterior for the importer have in reality been a very different product from that which formerly was entered. The fact of the matter is that the sale of the expensive and high powered foreign cars has dwindled terribly during the past three years, and the importer in the interests of self-preservation is forced to get down to a basis of price competition, or something very like it.

Just here considerable importance attaches to the present situation abroad. Europe, slower in feeling the effects of the financial depression of last year, has also been slower in recovering from it than the United States. The natural result of this has been a curtailment of production among the automobile makers and with rare exceptions, if any at all, the manifestation of a desire to cater to the ever available intermediate field with a medium priced product. Added to this that the medium priced chassis also lends itself well to the demands of the commercial cab and the inducement is complete. The present session of the Paris Salon tells the story in figures better than words, and the attitude of the American Importers is a natural corollary of it.

In this connection it is particularly enlightening to note the altered attitude oi the importers who, through their representative declare the generous use of American machinery by the foreign builders to be a valid reason for a reduction in the tariff upon the finished product. This is a marked concession, as it is not so very long since the alleged supremacy of the foreign-made machine was declared to be based on the accuracy of the hand workmanship employed in its construction. Indeed, that argument stood in good stead for several years. Another marked concession is disclosed by the further excuse for tariff reduction on the ground that it constitutes an encouragement to home industry, since 90 per cent. of the bodies placed upon foreign chassis are produced in this country. As a matter of fact, it was the first sign of weakening when the American made body began to come into use on foreign cars to a noticeable degree two or three years ago.

It can no longer be held that the foreign product, as a class, is superior to the domestic either in point of design, material or construction. With the gilded halo of its high price removed, it is questionable even whether it would find as ready a sale as it does just now, as it stands upon its pinnacle of exclusive appeal to a certain class of buyers. At all events, the efforts to popularize it on even terms with the home product are productive of no small diversion.

Abandonment of Circular Track Races.

Without desire to detract from the credit which is due the American Automobile Association for setting itself on record as against the practice of automobile racing on circular horse tracks, it may be granted a pity that it had not the courage of its convictions in sufficient degree to take a firmer stand and prohibit it outright. As it is, this branch of the sport is practically cut adrift and left to its fate without the control of any governing body. The declaration of the "Three A" goes not further than to express a conviction of its inutility and to foreswear any further countenancing of it. It might better have stood upon its prerogatives as the governing body over all national contests and forbidden its continuance, instead of itself executing an humble retirement.

The perils which follow in the wake of racing upon circular tracks are so certain and insistent that that branch of competition has become conspicuous for its disasters. A totaling of the list of crippled and maimed in the industry as a result of its horrors—they are nothing less—would yield a surprising number of names of those who in their day were reckoned not so much reckless as skilful drivers. The list of the killed no one has yet had the courage to compile.

With the growth in popularity of endurance contests of the more rational, if no less exacting or strenuous kind, hill-climbs which tax the driver and his machine to the uttermost, and road races in which the stretches are of sufficient length to compensate for time losses at the turns, the need of the circular track has gone out of existence. The parkway idea is too young as yet to be judged on its commercial merits, but it offers the most legitimate outlet for the high-speed impulse and for the requirement for high-speed competition on a large scale.

COMING EVENTS

December 5-6, San Francisco, Cal.—Automobile Dealers Association's track meet, Tanforan Park.

December 12, Denver, Col.—Denver Motor Club's hill climbing contest, Lookout Mountain.

December 12, Worcester, Mass.—Worcester Automobile Club's 200 miles reliability and endurance contest.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15-20, Cleveland, O.—Automobile show, Central Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 16-18, Denver, Col.—Denver Motor Club's first annual show, Auditorium.

February 22, Ceveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

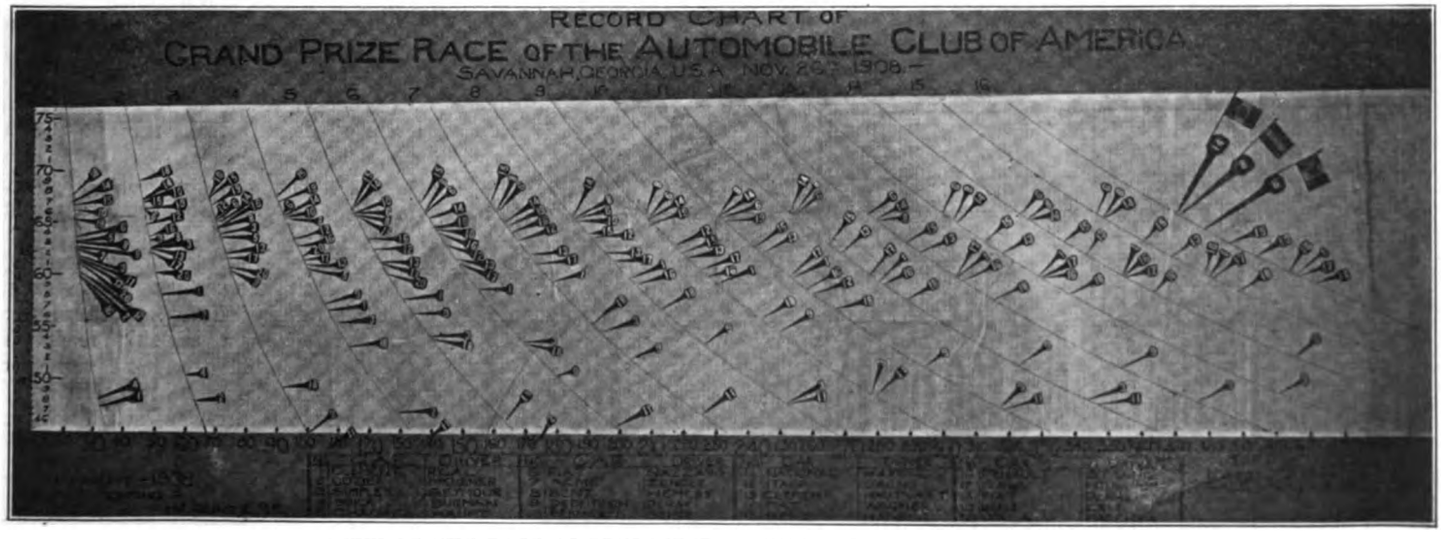
WAGNER NIPS GRAND PRIZE BY SECONDS

Driver of Victorious Italian Car in Savannah's Spectacular Contest Covers 402.08 Miles at Average Speed of 65.1 per Hour —Hemery Finishing First Gets Second Honors—Police and Militia Guard the Course While Vast Crowds See Race.



Stop-watches only split down to fifths of a second, and yet even this brief unit of time is too long in which to express the difference in average time per mile between the first and second cars in the Grand Prize race held at Savannah, Ga., on Thanksgiving Day. The race was for a distance of 402.08 miles, 16 times around a course measuring 25.13 miles, and the net time between Wagner in the No. 14 Fiat, the winner, and Hemery, in the No. 8 Benz, which finished second, was 56⅗ seconds. Wagner's time for the whole distance was 6 hours, 10 minutes, 31⅗ seconds, an average speed of 65.1 miles per hour.

Not only was this remarkably close result a record of its kind in automobile road racing, unlikely to be approached for many years, but the incidents of the final struggle were of a character to rouse the spectators to the highest pitch of intense excitement, the three leaders, Nazzaro, Hemery and Wagner, see-sawing and interchanging positions so that no one could pick the final winner with certainty. Even when the last of the three finished, it was necessary to wait for the timers' announcement before one could be sure who had won.

The finish provided dramatic changes in fortunes for both the Benz and the Fiat camps, Nazzaro at the start of the last lap appearing to have a sure grasp on the victory, but Hemery overtaking him and arriving first, quite changing the aspect of things, so that it appeared to be a Benz triumph. The flying Wagner then became a factor and wrested the victory away from Hemery, making it secure for the Fiat camp.

Quite as marvelous as any other feature of the race was the perfect manner in which it was guarded and kept clear. The gold room of the Bank of England is easier of access to the man without the necessary credentials than was the roadway of the Savannah course. Bayonets that were itching to stick somebody and lead-loaded revolvers with hair trigger attachments made it perilous for anyone without a full set of passes, badges, certificates and brassards to so much as set foot on the edge of the roadway itself. Furthermore, if the road pass designated the point at which the holder might cross, it was highly injudicious for him to attempt to use it anywhere else, as he was very likely to land in jail or the hospital.

One white man, driving a horse, was stabbed in the ribs with a bayonet for not getting off the course as quickly as the officer in charge demanded. He is still in the hospital, the stabber being commended for efficient performance of duty. No record is possible of the number of venturesome colored unfortunates who were punctured with the soldiers' steel or poked in the stomach with gun butts, but the majority of the colored brethren and sisters and young folks were healthily afraid of the militia and were scrupulously observant of the

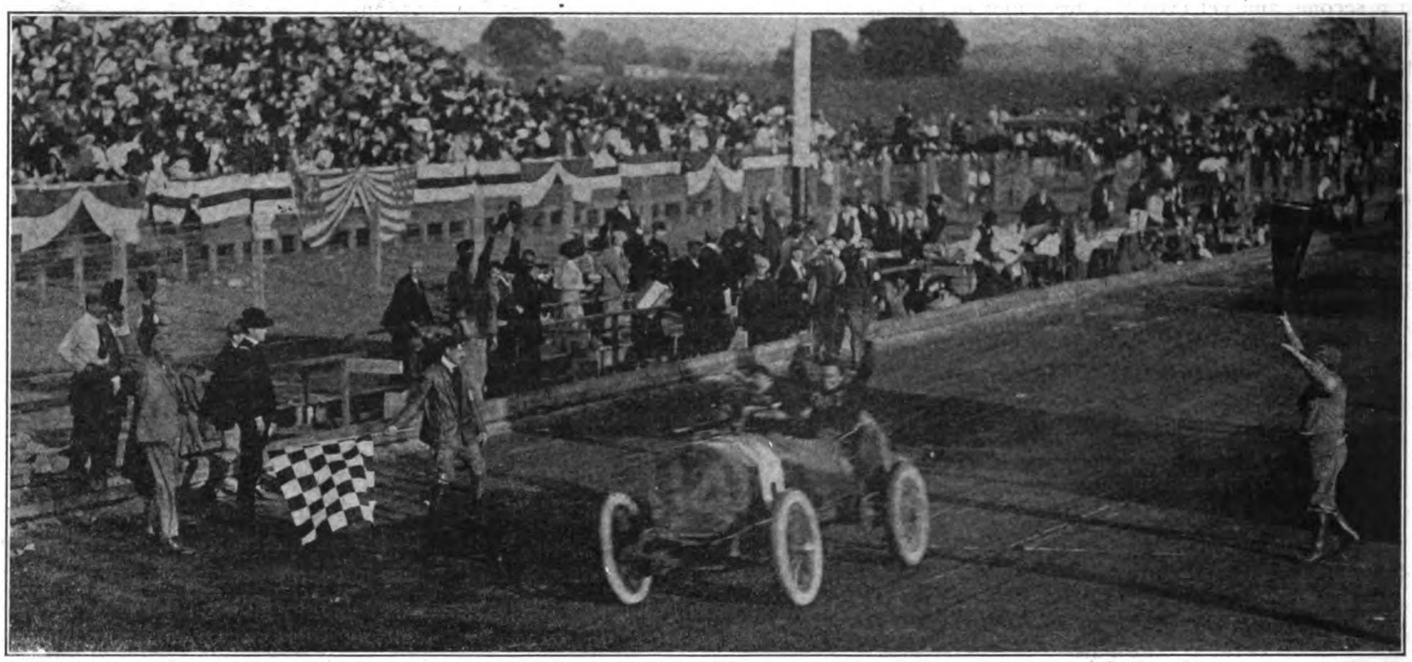
regulations imposed on spectators and so vigorously enforced.

Hanriot, driver of the No. 15 Benz, after finishing fourth in the race, filled up with gasolene and started back on the course to his camp, in a reverse direction. He was gone before the patrolmen could stop him, but the soldiery soon called upon him to halt. Although he slowed up several times at their upraised hands, he did not stop, being unable to understand English. Whereupon an officer drew a revolver and shot holes in the rear tires and the gasolene tank of the big racing machine. When the official word came that the race was over, the racing Hanriot was permitted to resume his trip back to his camp.

Special trains from New York, Washington, Cleveland, Indianapolis and Chicago, as well as from many points in the South, not to mention the boats from New York, brought hosts of visitors into the city, and the attendance at the race was conservatively estimated at 100,000 people, although some calculations placed the estimate at twice that figure. While the light car race on Wednesday was well attended, it was the Grand Prize affair that found all Savannah and its visitors present.

Betting and bookmaking were more conspicuous than at any of the Vanderbilt races, the latter being the natural standard for comparison, so far as big car races in this country are concerned. The lobby of the De Soto hotel on Wednesday night was a busy scene of wager laying, and the diminutive Tod Sloan, ex-jockey and meteoric sport, dressed in evening clothes and a plaited, bulgy white shirt, was the center of one of the many rings of bettors. That the betting was on wise "dope," was shown by the results, only small odds being given on Hemery, Nazzaro and Wagner, the last wagers making Wagner a favorite with Hemery, 3 to 1 being given on each.

As was to be expected, the race brought to Savannah a great number of men prominent in the trade, a roster of whom would read like a directory of the industry. Not a few were to be found in the press stand, either as "assistants" to the men writing the accounts of the race or as representatives of mythical and heretofore unheard of "syndicates" or press associations.



Enjoyment of their two days' stay was assured to the visitors by the genuine and unfailing hospitality of Savannah's citizens. The local residents wore large red badges, reading, "I live here. Ask me." Furthermore, they would accept, too, there being opportunities on every street, as the prohibition law is only a "Jim Crow" affair in its local application. The bars for white men were wide open, and at the De Soto hotel no soft drinks were available. But the red badges proved of real service for strangers who did have to ask for directions or information, and in every case inquirers were given every assistance possible.

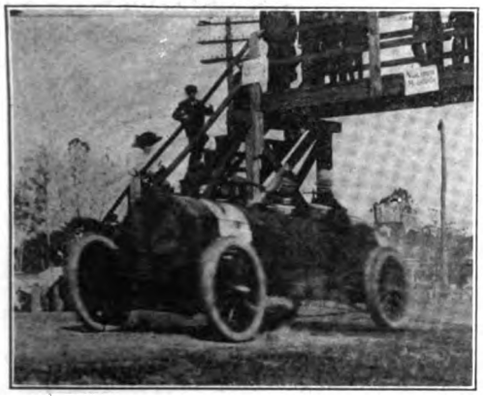
A strong local pride in the success of the races was apparent, Savannah being very earnest in its desire to have future events of like character held on its splendid course. The latter is on the public roads of Chatham county, adjacent to the city. These roads are of Augusta gravel and are scientifically constructed, varying from 30 to 60 feet in width. The oil treatment which they receive in preparation for a race makes them almost dustless, and the sharper turns are well banked. The permanent grandstand now seats a total of 21,000 people, a section seating 5,000 people having been added just before Thanksgiving Day.

"Did you enjoy the race?" asked a passenger on the observation platform of one of the special trains as it pulled out Thursday night. He addressed a prosperous but austere looking man, who looked like a typical bank president.

"Anybody who saw that race," replied the latter, "and then beefs about not getting his money's worth is an undesirable citizen."

Fog, heavy fog, wrapped up the morning of Thanksgiving Day and completely answered the criticisms of the grumblers who had complained that a break-of-day start would be much more "picturesque" for the Grand Prize race than the comparatively late hour of 9 o'clock, which had been set.

SCENE AT THE FINISH—WAGNER'S SPECTACULAR ARRIVAL



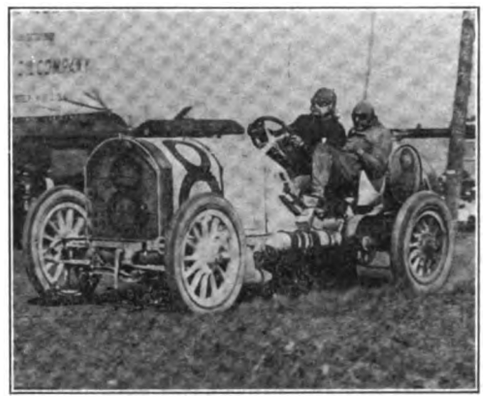
From the first gray peep of morning the crowds began trooping to the course and grandstand, through the heavy blue mist, and many rural spectators, who had driven in with wagons or buggies, took up their positions by the roadside in the dark hours of the night. By half-past eight the stand was filled, and the racing machines themselves were all gathered before the pits, ready to take their positions for the start.

Even at close range it required eager peering to identify them through the thick haze of the morning vapors, their long, hulking red, blue and white bodies all looking very much alike. In contrast to the start of previous big races in this country, there was little raising of hoods or tinkering, all of the drivers apparently being satisfied that their cars were in the best possible condition. A few went over their machines in a casual way, rubbing with waste here and there, or re-arranging the tools between the seats, but most of them stood about in groups discussing the fog or receiving the good wishes of officials and friends. Each machine was well guarded, however, by attendants in overalls, who cast dark looks at thoughtless officials who, having the priv-

Digitized by Google

ilege of the course, in some cases leaned against the racers.

As 9 o'clock approached it became apparent that the mist was still too heavy to permit a start, and word was passed that there would be a wait of half an hour to give time for it to clear. The more frivolous of the drivers and mechanicians amused themselves by tossing silver dollars into the air and matching, until this diversion

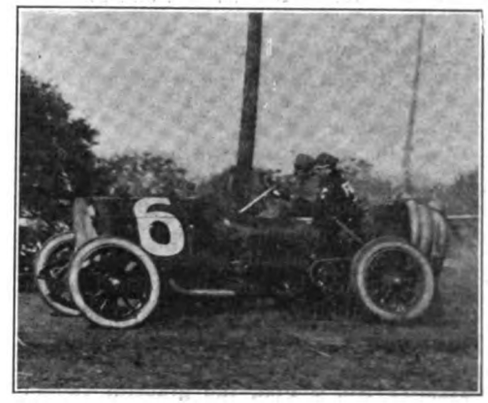


WAGNER FIRST

was put at an end by the chief of police, who escorted the men back to their cars by their coat collars, amid much laughter. The dapper Nazzaro appeared on the scene dressed in a bluish gray union suit effect, which set off his slim lines to great advantage, while Fournier presented a very different aspect in a costume consisting of knee-length khaki trousers, giving him the appearance of a brewery cask handler, or something equally burly and unromantic. Hemery wore a plaited gray plaid short coat, knee length trousers and puttees, leaving it to his mechanic to sport voluminous overalls. The prize in the costume line went to the Lozier team, both Mulford and his mechanic having long white coats, and headgear with flowing white streamers. The pair presented a smart appearance when in their all-white outfit they went to the line.

Although at half past nine the fog was still too thick to make it safe to send the cars off, the moisture was nevertheless condensing rapidly, falling like fine rain and making the roads wet and slippery. It was announced that 9:45 would be the official starting time. The effect of this announcement immediately converted the space in front of the grandstand into a theater of feverish activity. From a mixed mass of cars active attendants soon wheeled the machines into two lines back of the tape, according to their numerical order. Practically all of the motors were then cranked and the engines permitted to run for a few moments, to make sure of no difficulty at the starting line. While making a good deal of noise, none of the cars made the battle roar which has been a feature of the Vanderbilt events, as instead of the open exhaust direct from the sides of cylinders, most of the engines were fitted with manifolds which carried down and back to a rearward pointed exhaust box. The latter, while without baffle plates or muffler construction, reduced the sound considerably. All the tires at the start were fitted with nonskid treads.

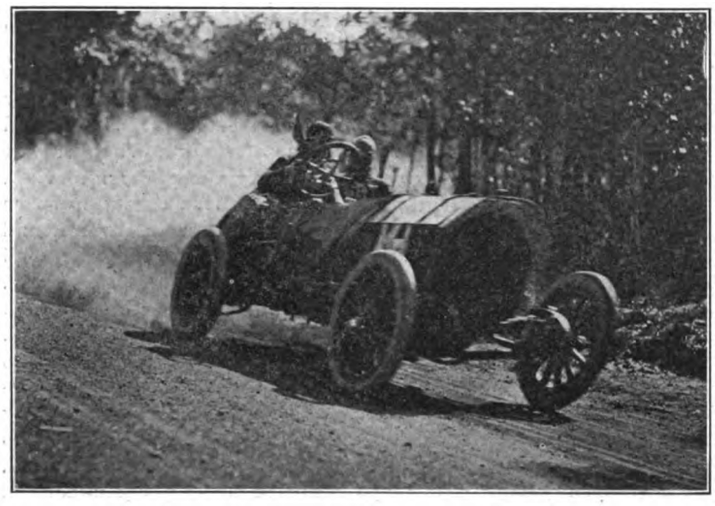
Even at 9:45 the air was still thick, but the blue Clement-Bayard, bearing No. "1," was sent off amidst rousing cheers from the grandstand, the cheers being taken up in the distance as the spectators along the course caught sight of the rushing monster hurling through the mist. The white Lozier, No. 2, put after it a minute later, the streamers from the caps of its occupants floating out straight behind and giving an impression of great speed. The other cars followed in order a minute apart, all of them getting away in good style and spinning off into the rapidly lessening haze, which quick-



HEMERY SECOND

ly swallowed them from sight. When the whole 20 had been dispatched there was a buzz of expectation as to what changes the first round would show in the running order. In the few brief minutes before the leaders should appear, the sun began to assert itself, and the dark gloom of the early part of the morning quickly melted away before its powerful warmth and light.

The first tidings of the progress of the race came in the form of a telephone message to that effect that No. 1 had "passed Burnside," which information, while taken to indicate that the car was "on its way," did not signify much else, as very few knew where Burnside was, and it was not marked on the maps accompanying the program. This was followed by information that other cars had passed the same point, but the announcements were cut short by the call of the bugler at the end of the grandstand, giving the signal that a car was nearing. Through the remaining traces of the morning's mist the No. 2 Lozier loomed into view, white streamers and all, and went thundering by the stand for the start of its second lap. It was cheered unroariously as having overtaken its French predecessor, but after the No. 3 Simplex and the No. 5 Chadwick came along, without contest from the No. 1 Clement, it became apparent that the latter must have had some trouble. Later reports showed that the car had magneto difficulty and that Rigal, its driver, had stopped to fit a new one.



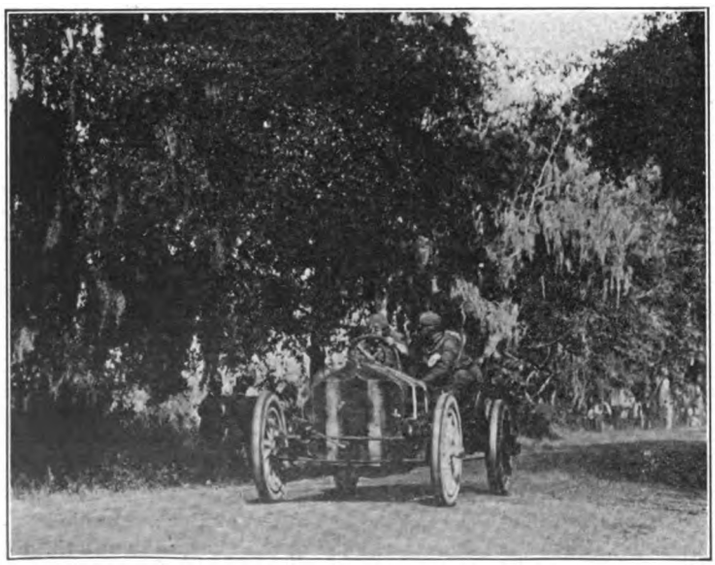
Nazzaro's No. 6 Fiat was the first of the foreign cars to appear and it whizzed by with a speed and steadiness that seemed to spell confidence of victory. A short wait of two minutes brought Hemery into view, his great white No. 8 Benz eating up space in a fashion that was glorious to see, and whirling away in pursuit of the swift and elusive Nazzaro. Next came No. 10, Szisz, in a blue Renault, the car with its rakish prow and low lines going by like a streak. The tow-headed Duray, with No. 9 on his De Dietrich's radiator, romped past a moment later, followed in a few seconds by the delayed Rigal in the No. 1 Clement, who was greeted by cheers. A red Itala, No. 12, piloted by Cagno, led the long, cream-colored No. 7 Acme, driven by Zengle, by a few seconds. Burman's No. 4 Buick pounded across the line, but with no sign of the necessary speed. About a minute later No. 14, Wagner, in a red Fiat, darted into view and was gone, with a hum that was almost musical being so regular. His Fiat, too, like Nazzaro's, had a Benz pursuer, the sturdy German machine No. 15, driven by Hanriot, flying after it in strong style.

NAZZARO THIRD

Strang was looked for next, in the No. 16 Renault, but No. 13 Clement-Bayard, with Hautvast at the wheel, appeared. When the bugle next sounded, it was for No. 18, De Palma in a Fiat, who came tearing down the stretch and off into the distance at a marvelous pace, having made the first lap in the fastest time of all, 22 minutes and 18 seconds for the 25:13 miles. It was hard to pick Strang when he came, his car being disclosed without its screen-like bonnet with which it had started, the engine showing bare. Despite this indication of trouble, however, he was making good speed and was given a hearty vocal encouragement by the rooters. Fournier was right after him, with the black suspenders showing over his fat back as his No. 17 Itala barked in the chase. The only real German driver in the race, Erle, in the No. 19 Benz, was obviously faster, gaining rapidly on them both, yet sweeping by in a nonchalant way that be-

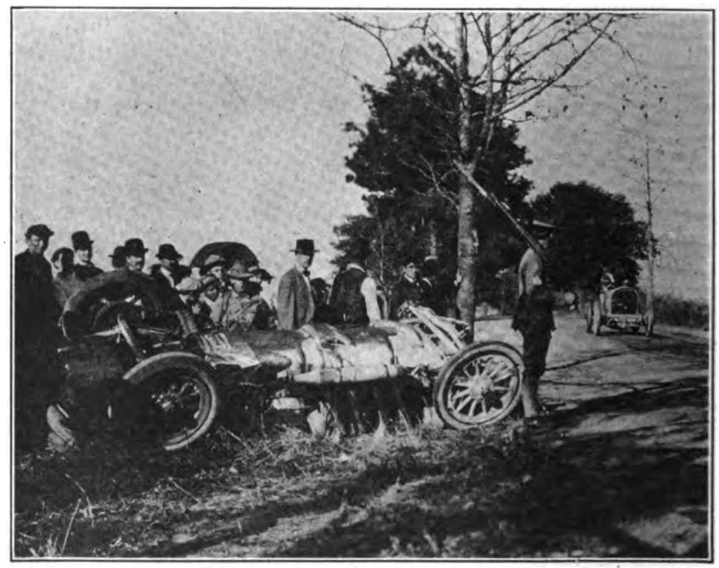
Digitized by Google

WAGNER'S LIGHT TOUCH AT A TURN



DE PALMA SWEEPING A CURVE

spoke considerably more speed in reserve. The Itala No. 20, the last to start, showed up about three minutes later, running well, with Piacenza as the pilot. All but the No. 11 National, with Harding up, were thus accounted for on the first lap, the times showing that Wagner was next after De Palma in point of elapsed time, with Hanriot in the No. 15 Benz, third, and Szisz in the No. 10 Renault, fourth. Fifth position was earned by Erle in the No. 19 Benz, Nazzaro getting sixth, Haupt in the Chadwick making seventh, and Hemery the eighth position.



Under the strong sunlight the air was now perfectly clear and still, and when the bugle sounded, announcing cars coming in the stretch, it was possible to see them a great distance away, gradually growing bigger until they flashed by, and diminished again with equal rapidity. The leaders in the second round proved to be the No. 3 Simplex and the No. 5 Chadwick, followed shortly by Nazzaro's No. 6 Fiat, the graceful Italian lounging comfortably in his seat as he shot along at impressive speed. Hemery soon followed, and, while he was among the real speedsters, seemed to be holding plenty in reserve. In this lap De Palma, in the No. 18 Fiat, again took the honors for the shortest elapsed time, making the round in 21:36. He had almost overtaken Hautvast in the No. 13 Clement at the grandstand, but the Frenchman had driven furiously past the stand and down to the corner, half a mile below, where the course turned to the left for a long straight stretch of several miles. Across the fields it was possible from the stand to see both cars in this long stretch, and the spectators went into wild enthusiasm when De Palma was seen to enter the straightaway and gain in his chase. In the distance he passed the Clement, while the stands went crazy. The belated National, No. 11, made its appearance and completed its first round, having taken over 55 minutes, its delay being unaccounted for. But it came around the second time at good speed. All the contestants finished the second round, Wagner holding second position, next to De Palma, Hanriot in the No. 15 Benz holding third, Szisz in the No. 10 Renault fourth, and Erle in the No. 19 Benz, fifth. The road generals, Nazzaro and Hemery, were taking things more easily.

To use a bicycle racing phrase, De Palma "blew up" in the third lap, and instead of the 21:36 of his previous lap, he took 47:54 for the round. He had tire trouble, and some lubrication trouble. Furthermore the case for supporting his spare tires at the back came loose and let the "spares" drag on the ground. When he came around to the pits, the case was pulled off, and he tried to devise a makeshift holder for carrying his extra tires in safety. The best speed at the conclusion of the third lap had been by Hanriot in the No. 15 Benz, with Szisz second, and Erle third. Cagno in the No. 12 Itala, was in fourth position, with Nazzaro fifth, Wagner sixth, and Hemery seventh. It was from this time on that the last three began to "unwind," and to wage the Benz-Fiat battle in earnest.

First around on the fourth lap was Naz-

REPAIR PIT SHOWING STOCK OF REPLACEMENTS

zaro, going faster than previously. He had overtaken the Simplex and the Chadwick. Hemery was the next to appear. His pursuit of Nazzaro was unfaltering. When Wagner came along among other cars a little later, he, too, had manifestly let out another notch. His incentive to do so lay in the fact that Hanriot's No. 15 Benz, which had started one minute after him, was now about three minutes and miles ahead. In fact, the No. 15 Benz held the lead in point of elapsed time, as it had in the previous lap, with Erle's No. 19 Benz second, Nazzaro's No. 6 Fiat third, Wagner's No. 14 Fiat fourth, Szisz fifth and Hemery's No. 8 Benz sixth. At this time it was three Benz cars against two Fiats in the fight for first place at the finish, with little chance for any other car.

The pace had by this time put the Buick out of it, the car having retired near the county farm. The Chadwick, too, had quit because of lubrication and other difficulties. The Acme had to be taken off while a broken spring was reinforced with a block of wood, and the Lozier and the National were only appearing occasionally, while the Simplex was running a somewhat doubtful career, but making a good showing thus far. The repair pits in front of the grandstand began to have plenty to do, as various cars would stop for tire changes or minor replacements, or replenishments of gasolene and oil.

For the fifth, sixth and seventh laps Hanriot in the No. 15 Benz continued to hold first place in the elapsed time. Hemery took second place, Nazzaro third, and Wagner fourth, the four men remaining in this order of position until the eighth round. In the sixth lap Duray limped up to his De Dietrich pit with the strut rod on the right side of his machine crumpled up and his rear axle considerably askew. Working like mad, he and his mechanic took off the right chain, dismounted the whole rear wheel brake mechanism, took off the distorted rod, fitted a new one,, replaced all the brake mechanism and the chain, and were gone again, in less than 15 minutes. There was a great demonstration in his honor as he started off, in appreciation of his rapid work. As one bystander observed, "That would have been a day's work in a repair shop." In the seventh lap, De Palma again made the round in 21:36, which time for a single lap was not equalled by any of the other drivers.

In many ways the eighth round was one of the most important of the race, since it marked the half way point and disclosed the different policies of the drivers. A majority of them took occasion on this round to change from non-skid tires to smooth treads, the course having dried perfectly under the baking sun. Nazzaro was the first to stop. Jumping out lightly he and his mechanic worked with marvelous precision in taking off the caps of the oil and fuel tanks and the radiator, and introducing to each a big funnel. In a moment the water, oil and gasolene were pouring into their respective apertures as fast as they would flow, while Nazzaro examined his tires, rubbed his hands with liniment, discussed

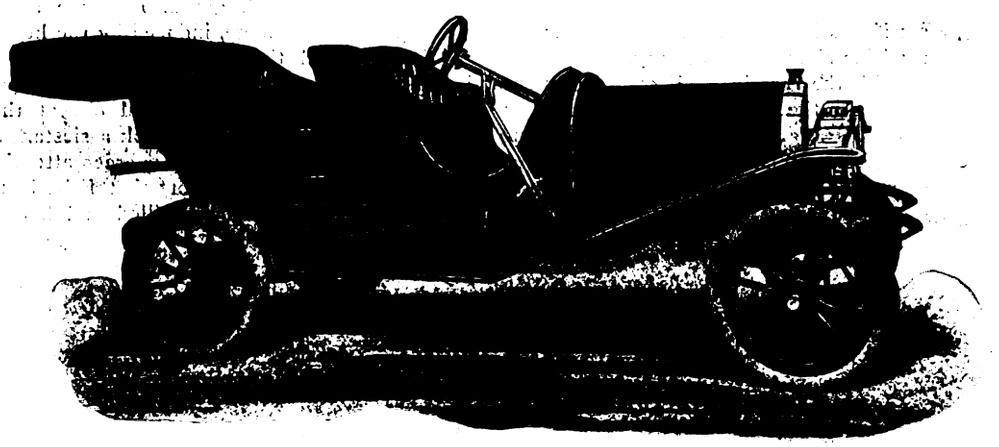
with the men in the pit whether he should change to smooth treads, and learned where he stood in the race position. He took a sip of champagne and then tossing the funnels into the pit and replacing the caps, vaulted into his car again and was off, just as Hemery came sliding in. It was the first sight that pursued and pursuer had had of each other since the start of the race, the space between them having all along been represented by almost exactly two minutes.

BITS OF LOCAL COLOR ALONG THE COURSE



Nazzaro had by the precision of his arrangements and method of working reduced his stop to a fraction less than two minutes, and it remained to be seen if Hemery could do as well. Hemery, however, had a trick or two better than Nazzaro's. His fuel and oil were in portable receptacles with short funnel spouts, which when placed on the openings of the car's tanks could be left unattended until the contents had all poured down, when the portable receptacles would fall off empty. While his mechanic gave a moment to the radiator, Hemery manipulated a jack, raised his rear axle and punched a file into his two rear tires, deflating them for a quick change. In a few seconds more new tires had been put on, the caps on his tanks were closed, and away he went, in but little more time than Nazzaro had taken. This put Hemery on a better footing than Nazzaro so far as tires were concerned, as the latter had evidently determined to try to get through on the one set if possible and to take his chances on a roadside change if necessary.

With the race but half over, the men and women in the immense grandstand began to seek temporary relief from the broiling of the afternoon sun. Stunning as were the gowns of many of the northern women in the stand, they were far too warm and uncomfortable to permit their wearers much enjoyment of the race, and the white summer dresses of the Savannah maids and matrons matched the temperature and circumstances much better. Big yellow butterfles lazily fluttered about the stand, sipping here and there at drops of spilled sarsaparilla and ginger pop, and mocking the furs which adorned the costumes of some of the sartorially incongruous visitors. In addition to dispensing "ice-cold soft drinks," venders traveled up and down the aisles hawking fans, which found a good sale, as there was hardly a sign of a breeze. Whole portions of the grandstand were vacated for a time, while the spectators went for lunch, some of them even going to their hotels or railroad dining cars and returning in time to see the finish.

A brisk fire in the tall dry grass back of the parking space at one end of the stand gave several municipal firemen, armed with portable chemical extinguishers, a lively quarter of an hour, but did not seem to create any alarm in the stand, although it was close by. A genral lassitude spread over the assemblage, induced by the heat of the day and the growing monotony of watching the lesser cars pass. Where space was available, men stretched out at their ease on the benches, and took a siesta.

Shocking the crowd into erect attention, came the telephone report that Erle, in the No. 19 Benz, had been killed and his mechanic fatally injured, through smashing into a tree. The physicians comprising the emergency medical corps at the grandstand were quickly assembled, and some of their number were tolled off to an official car, for a fast run to the scene of the accident, not a great distance away, on the White Bluff road. The boyish Herr Neumaier, director of the Benz selling corporation, who was in charge of the Benz pit, jumped out in his blue overalls, and wanted to go, too, but was not permitted to do so. His grief and agitation over Erle's fate was very sincere, and he ran out of the enclosure seeking to reach his unfortunate driver by means of a machine outside the course. Before he got away, further telephone reports made it clear that Erle had not been killed and that his mechanic was uninjured. A few minutes later the details of the mishap were announced, to the effect that the nonskid tread of a right tire had torn loose, striking the driver in the head and making

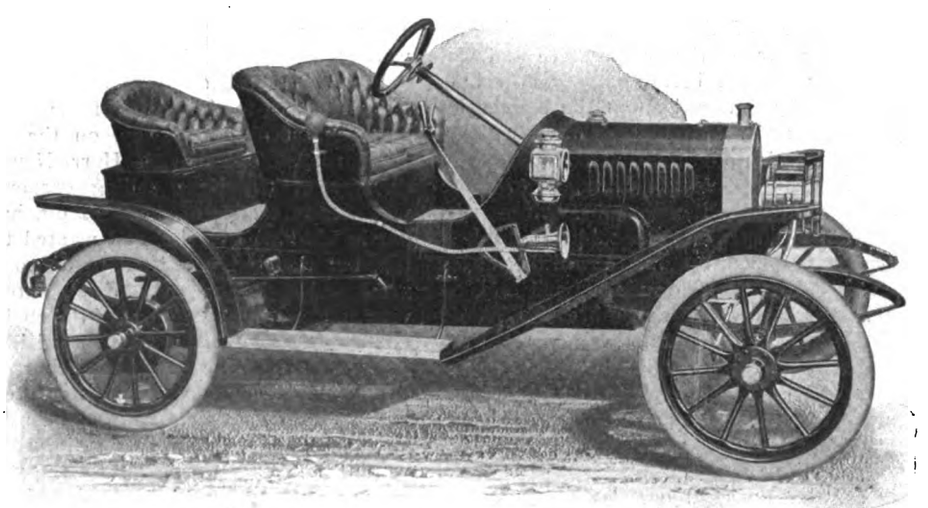
$1250.00
Lambert "30"
(SEE DESCRIPTION BELOW.)

The 1909 Line of Lambert Cars

(FRICTION-DRIVE)

OFFERS BIG POSSIBILITIES TO PROGRESSIVE AGENTS

The line will include six different cars, ranging from an $800.00 runabout to a $2000.00 7-passenger touring car.



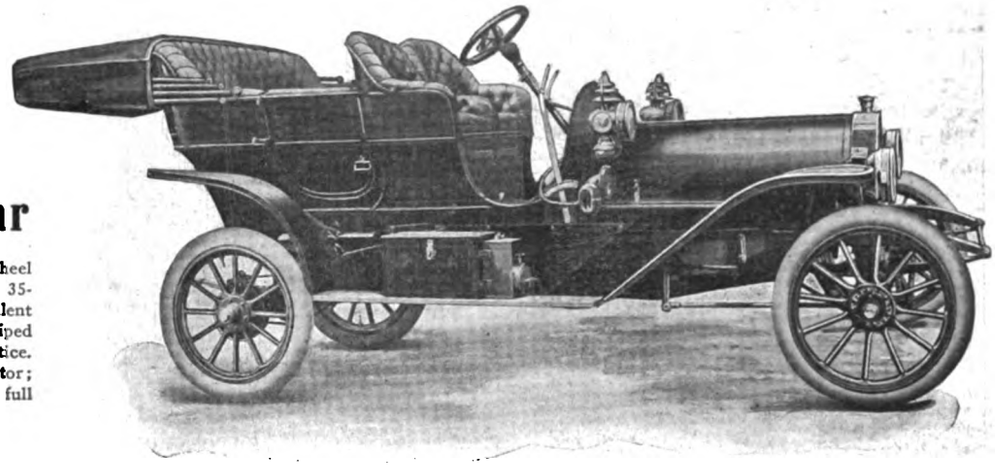
Every one of these cars is an extremely attractive proposition in its class, and even without the friction drive transmission (which is universally regarded as the ideal transmission) would compare favorably in every particular—design, workmanship, and finish, with other cars having the complicated and costly gear transmission.

The Lambert "30"

The Lambert "30," illustrated above, is unquestionably one of the biggest values in $1250.00 cars that will be offered in 1909. Here are a few of the specifications:

CAPACITY: 5 passenger.
HORSEPOWER: 28.
MOTOR: 4 cylinder Rutenber
SPEED: 1-45 miles.
WHEELS: 30 inches.
WHEEL BASE—110½ inches.
DRIVE: Single silent chain, enclosed in dust-tight metal case.
TIRES: 30"x3½".
DETACHABLE TONNEAU.
WEIGHT: 1600 lbs.
PAINT: Body deep red; light red stripe on panel; black molding; running gear, light red, striped with English Vermillion. Special color on proper notice.
EQUIPMENT: 2 gas lamps and generator; tail lamp; 2 oil side lamps; 40 in. flexible tube, horn and full tool equipment.
PRICE: $1250.00 f. o. b. factory.

THE $1250.00 MODEL 27 carries the same specifications as the Lambert 30, except that it is equipped with 2 bucket seats instead of tonneau.



The $800.00 Lambert Runabout

MODEL A-1—Will accommodate three passengers; rumble seat; 30x3" tires; 18 H. P.; speed, 1-35 miles; single chain drive, enclosed; weight, 1500 lbs.; 2 gas lamps and generator; 2 oil lamps; tail lamp; 40" flexible tube, horn and full tool equipment.

MODEL A-3, ($875.00)—Carries the same specifications as Model A-1, with the exception that it is equipped with a surrey seat in rear instead of a rumble seat.

Digitized by Google

The $1750.00 Lambert Touring Car

MODEL 19—Carries 5 passengers; 117" wheel base; 30x3½" tires; 4 cylinder Rutenber motor; 35-40 H.P.; speed, 1-50 miles per hour; single silent chain drive, enclosed; painted Lambert green, striped with light green. Special color on proper notice. Weight, 1900 lbs.; 2 large gas lamps with generator; 2 oil lamps, horn; tool box on running board; full tool equipment.

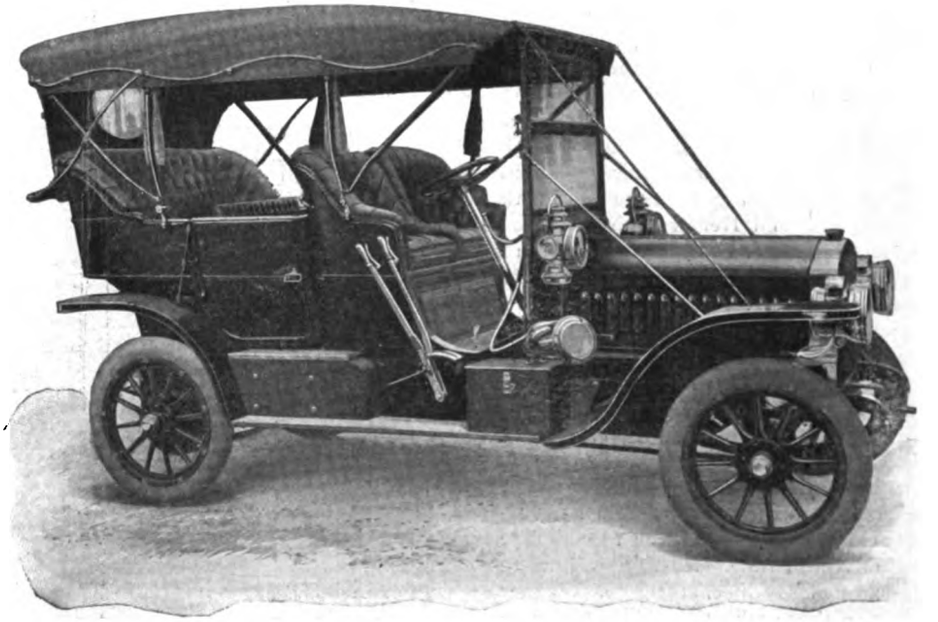
Agents Wanted in Unoccupied Territory

There is going to be a big demand for low-price cars during the coming season, and the variety and prices of the Lambert line offer exceptional opportunities to the right kind of agents.

We desire agents who will make a specialty of demonstrating the Lambert cars; who appreciate the fact that the friction drive is the simplest, most economical, and most satisfactory method of transmission, and who will properly place this fact before prospective buyers.

We know from experience that Lambert demonstrations almost invariably result in sales.

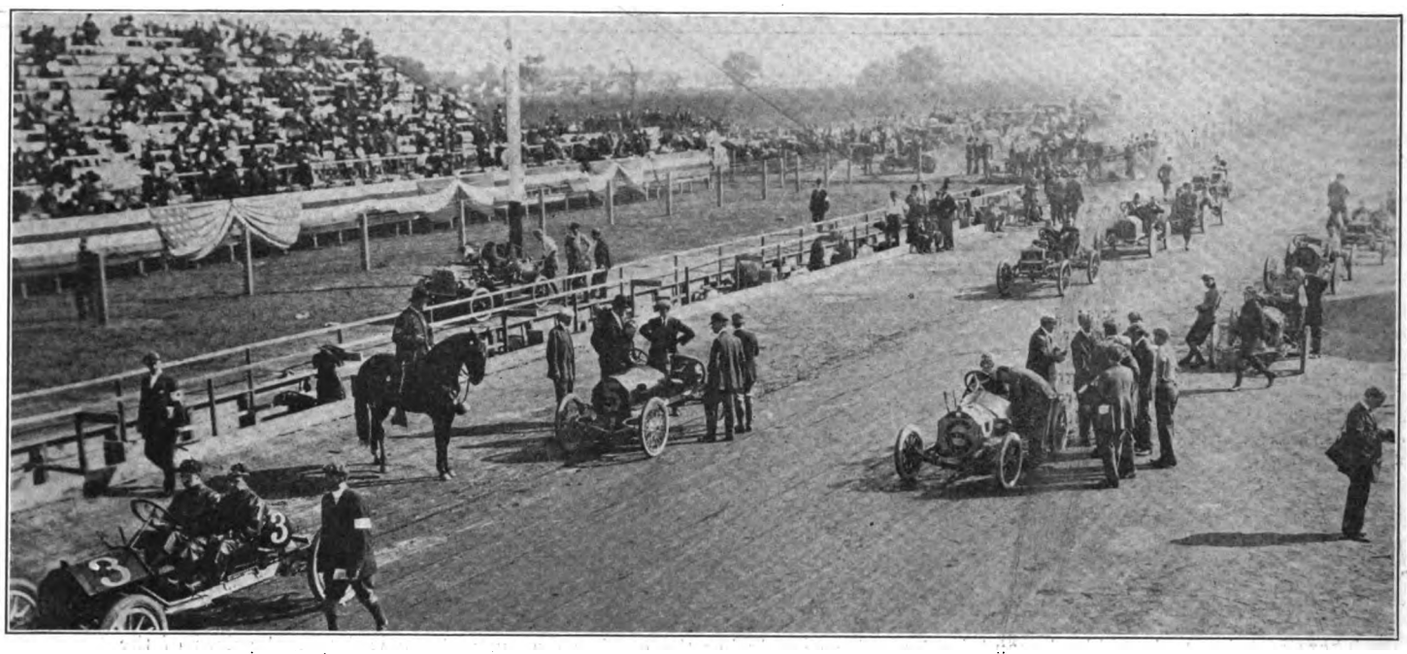
The Lambert friction drive (which should not be confused with certain other friction devices) is covered by a basic patent that incorporates the only successful mechanism of its kind on the market, and the agent who places himself in a position to demonstrate and deliver Lambert cars will not only have all the advantages of a unique and increasingly-popular car, but will find an easy market for all the cars we can deliver to him.



Furthermore, the Lambert proposition to agents is an exceptionally good one from a financial standpoint.

A special folder has been prepared for dealers who desire detailed information about these cars. This folder, together with our proposition, will be sent upon request to any dealer who will advise us as to the cars he is now handling and as to his facilities for properly representing us.

G. B. LAUDERBACK, Sales Manager.



BUCKEYE MANUFACTURING CO., Anderson, Ind.

The $2000.00 7-Passenger Lambert

MODEL B-2—Carries 7 passengers; wheel base 116"; 32x4" tires; 4 cylinder Rutenber motor; 35-40 H.P.; speed, 1-45 miles per hour; direct chain drive to each rear wheel; body imperial green, black moulding, running gear, imperial green, striped with carmine; cape extension; top, with full set storm curtains; glass wind shield; 2 large gas lamps with generator; oil lamps; tail lamp, horn; foot rail; tool boxes on running board and in rear; full tool equipment.

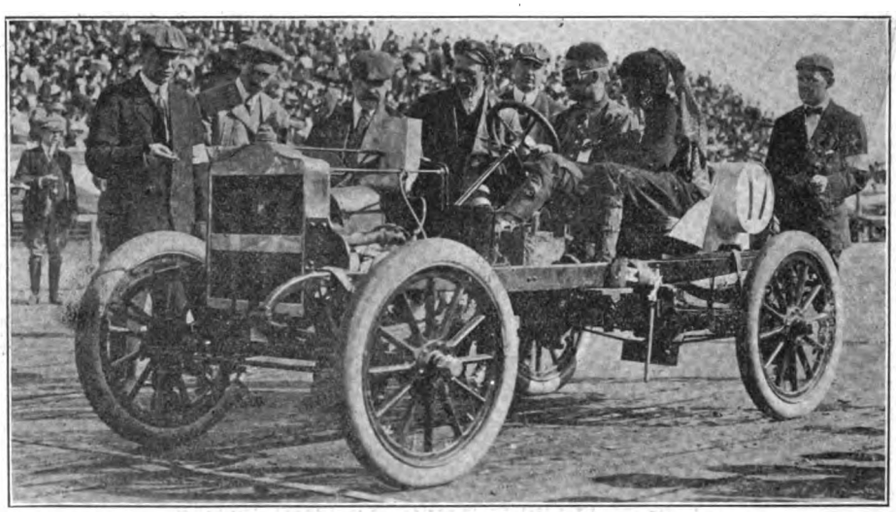
VIEW AT START OF THE LIGHT CAR RACE

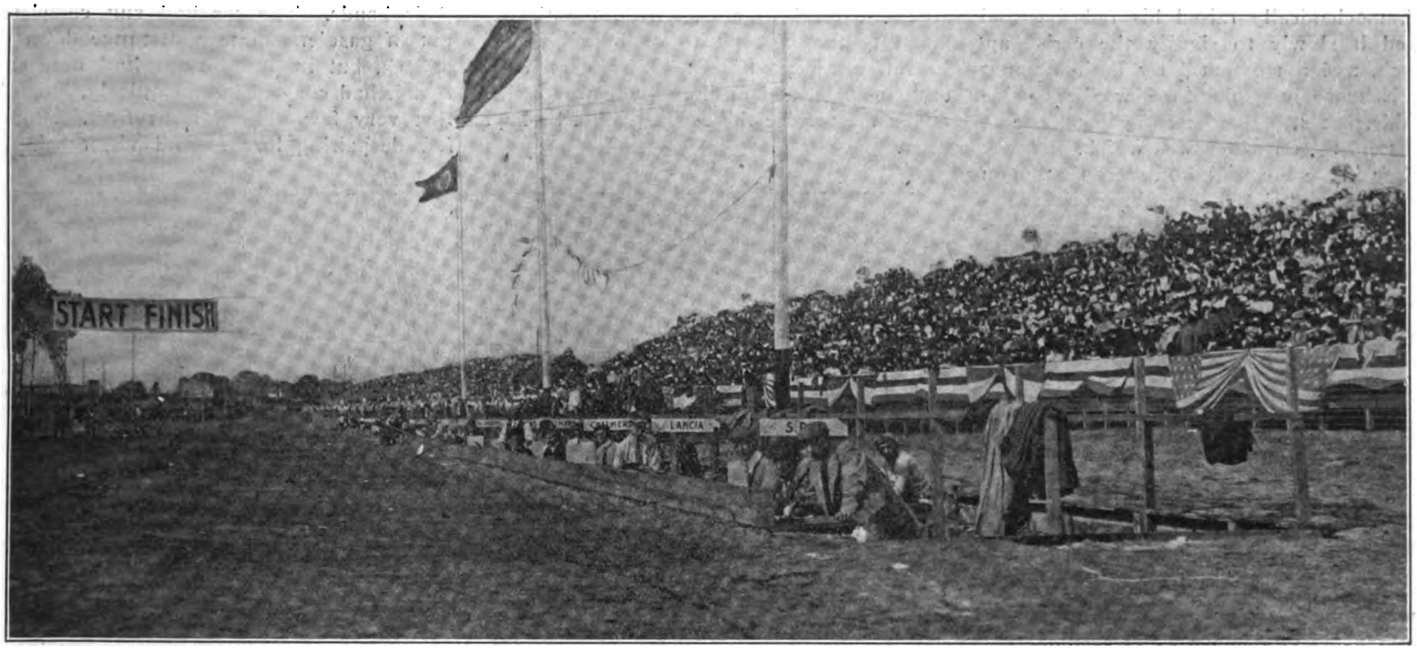
him lose control of the machine, which was going at full speed at the time. The car ran off the road, and turned over, but the mechanic was able to pull Erle from behind the steering wheel in his flight, and they both fell clear of the machine. The heavy steel studs of the tire had broken Erle's nose and jaw, as well as bruising his shoulder, and he was unconscious and bleeding. The mechanic and some women attended him until the physicians arrived, by which time he had sufficiently revived so that he was able to walk to a nearby hospital. It was declared by the doctors that a week or so in the hospital would find him in good condition again. At the time of his accident he was in fourth position on elapsed time, having commenced his eleventh lap.



Meanwhile Hemery had opened up and had taken first place on the time basis, for both the ninth and tenth laps, fighting off Nazzaro and Wagner, who in the ninth lap were second and third, and in the tenth lap third and second, respectively. Wagner won first position in the eleventh lap, with Hemery second and Nazzaro third, while in the twelfth lap Nazzaro took the lead, with Wagner second and Hemery third.

Wagner stopped at the pits in the twelfth round, to change tires. When the big frame jack had raised his rear wheels, he gave two quick jabs with a pointed tool, puncturing both rear tires with a loud report. The right tire was quickly replaced, but the left one was more obstinate and it took some fitting to get it on. Furthermore, the mechanic grabbed a coil of copper tubing from the pit and put in a whole new length of it in the air pressure line to the fuel tank, ingenious couplings enabling him to complete the job in record time. Hastily swallowing a generous glass of champagne, Wagner put off, and those who timed his stay were amazed to find that it had been only a few seconds over two minutes, although so much had been accomplished.

Only eleven of the twenty cars were still running in the contest. The Itala No. 20, driven by Piacenza, had left the course at the Isle of Hope in the sixth round and had not resumed. The Acme No. 7 had been unable to get along well with the broken right front spring which the driver had so pluckily repaired, and was out of the running in the seventh lap, while Szisz in the No. 10 Renault had had a ball break in a front wheel bearing, the wheel coming off and running against a tree, ditching the car on Ferguson avenue, in the seventh. At its twelfth round the Itala No. 12, driven by Cagno, drew up at the stand and then drove slowly off the course, one of its rear springs being broken, and no repairs possible in time for it to win. At about the same time the National No. 11, driven by Harding, developed carburetter trouble, and did not appear again.



The gay spirited Duray on his eleventh lap suffered an accident which a driver of less courage would have felt entitled him to retire. The chain on the right side of his No. 9 De Dietrich snapped, whipping a great gash in his arm. He managed to control the car until his mechanic could take the wheel and bring the machine to a standstill. The spurting blood was stopped and Duray's arm bound up as well as could be done on the road. The mechanic then fixed the chain and drove to the stand, where he called for a doctor. Duray would not quit the race, and the physicians fixed him up with temporary dressing and bandages. He called for haste, more haste, and as soon as possible jumped into his car again, the mechanic taking the wheel for the time being until Duray should feel able to drive. His stout courage won him a big ovation as he set out once more.

The battle between Nazzaro, Hemery and Wagner, with Hanriot ready to participate,

KELSEY, MAXWELL, AWAITING THE WORD "GO"

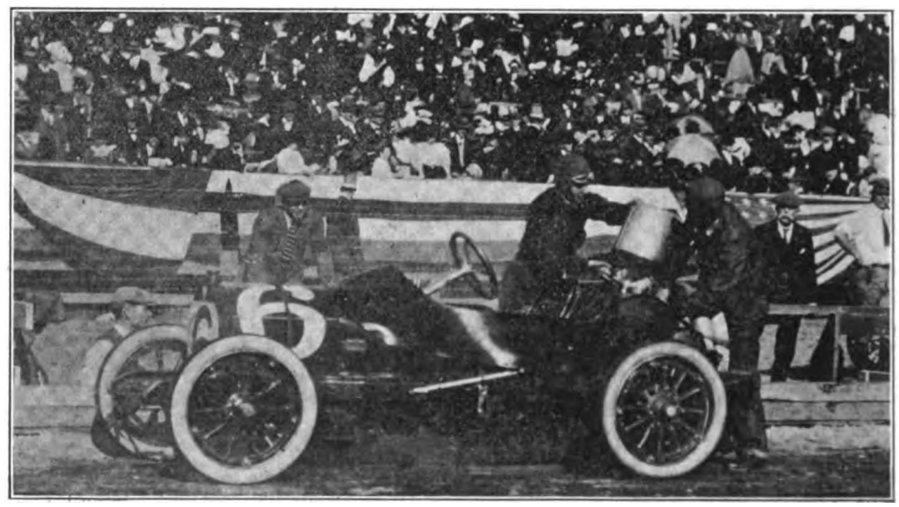
"CAR COMING!" VIEW OF THE CROWDED GRANDSTAND

grew desperate. With Nazzaro leading in the thirteenth, Hemery wrested second place from Wagner, the latter's stop helping to this result, although Hemery himself had had road difficulty, which had slowed him somewhat. Hanriot was fourth, with Hautvast in the No. 13 Clement-Bayard fifth.

The stands became packed with spectators again, to see the final struggle. Strang, Fournier and Rigal, while obviously no possibilities for first place, were fighting each other for sixth, seventh and eighth places, Strang driving hard from the last position.

In the fourteenth lap it was again Nazzaro, Hemery and Wagner, with but 29 seconds difference in time between the last two. In the fifteenth lap Nazzaro still led, with Hemery 1 minute and 52 seconds behind, and Wagner only 2 seconds after.



Coming down the stretch on the end of the fifteenth and the start of the sixteenth lap, Nazzaro, with dust begrimmed face but graceful and easy as ever, was running wide open, the signals at the pit giving him the flash that he was in the first position. De Palma's No. 18 Fiat came to a stop before the pits, to fix a tire. It got under way again just as Hemery was seen coming into the stretch, preceded by Strang, who was finishing his fourteenth. Because of the dust which Strang's Renault and the No. 18 Fiat were raising, Hemery had his circular dust screen up, attached at an angle to his steering post. His stocky shoulders hunched up, and his head bent sidewise behind the screen on his wheel as he tore through the dust without goggles, he looked the "speed demon" that he is, when fighting out a race. In due time, Wagner appeared for his last lap, too, with his engine singing in its highest key.

Nazzaro's victory was almost certain—unless something happened to his tires or mechanism.

"Hemery has passed Nazzaro!"

The message gave no further information, and the men at the telephone could get nothing more for the time being. E. Rand Hollander, of the Fiat camp, pleaded for details or a denial, or a substantiation, or something—anything! But his dismay and anxiety were unrelieved. The crowd could hardly believe the news. And then the surprise of it rather elated them and they strained their eyes down the stretch to watch for Hemery's coming to prove it. Each car that hove in sight set the watchers agog, but it was not until some of the tail-enders had passed that Hemery himself came into sight. On he came, a grin on his face and his mechanic waving both feet out of the car as a token of triumph. As he rushed over the line, the grandstand burst into one tremendous cheer, hailing him as the winner, while the Benz crew in the pits joyously flourished a big figure "1" to tell him of his victory.

The Fiat camp was very glum during the excitement, until it was recalled that Wagner had been only 2 seconds behind Hemery in elapsed time on the previous lap and still had 6 minutes in which to finish the winner, Hemery having started as No. 8 and Wagner as No. 14. This recollection came to the crowd, too, and everybody hastened to explain to his neighbor that Wagner still might win. Every one that had a stop watch took it out and started it, attempting meanwhile to estimate how many seconds back it was that Hemery finished. The owners of field glasses and binoculars called imperiously for their return, if by chance others had them, and every face was turned toward the distant point where Wagner would first come into view. The farthest flagman, after a seemingly interminable pe-

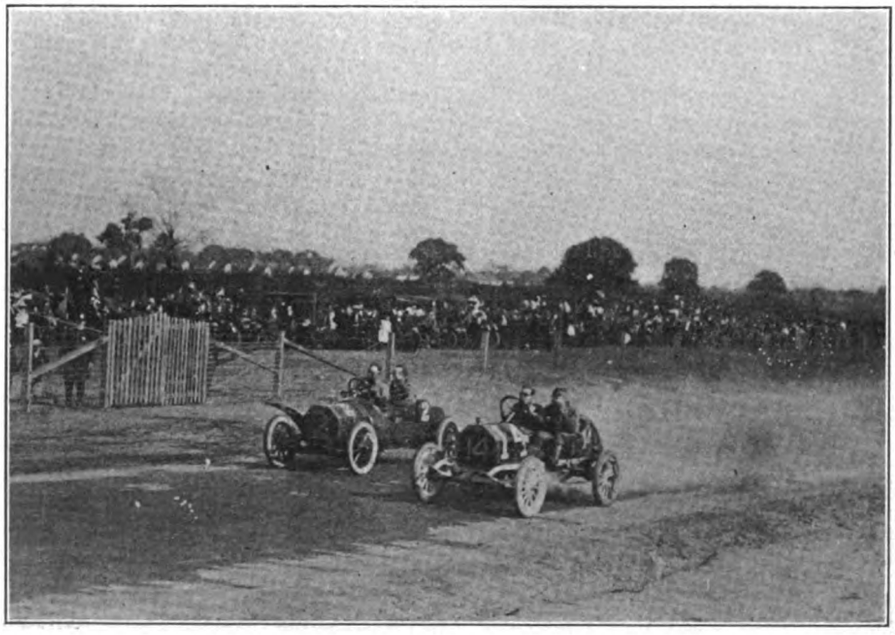
POOLE, ISOTTA, REPLENISHING AT GRANDSTAND.

Digitized by Google

riod, mechanically raised his red flag and waved it slowly to signify the car's approach, and a moment later both Wagner and Nazzaro jumped into view almost side by side, but still too far away for those at the stand to tell which was which.

They came so fast, however, that soon the white-painted "14" on Wagner's radiator showed him to be in front, the car swaying terrifically because of its speed. Before the spectators could even cheer he had swept over the line, Nazzaro at his heels, sure of third place.

"Wagner wins! Wagner wins!" cried some of the amateur timers, but nobody knew for a certainty, and while waiting for the official announcement most of the spectators simply gasped with excitement, or marvelled with their companions that there could ever be an automobile race of 400 miles that would be so close in the finish.



Hollander's pleadings to the timers to know the result were soon rewarded by a nod that Wagner had really won, the time at first being announced as 14 seconds, but later corrected to 56 seconds. Again the cheering was taken up, the new victor getting a demonstration such as had a few minutes before been given Hemery.

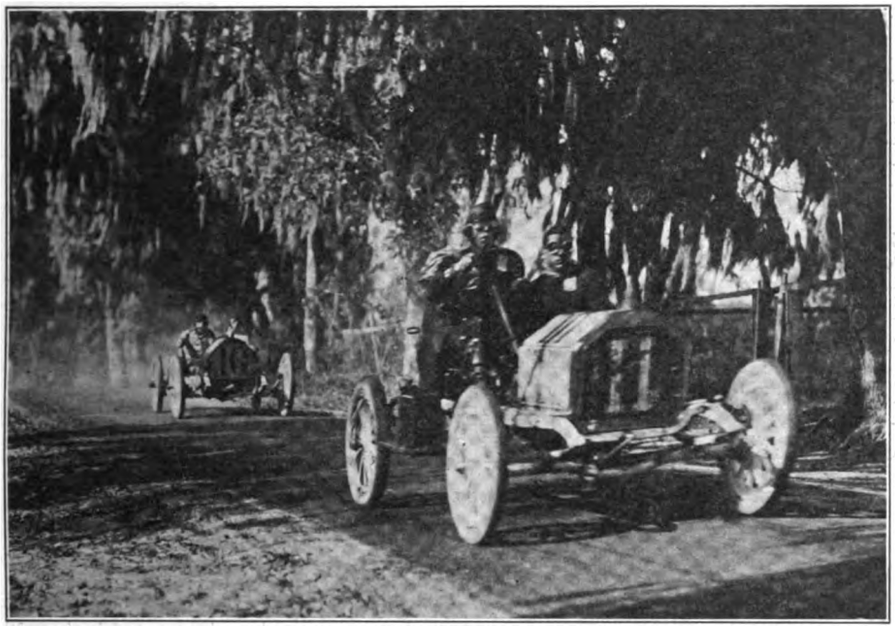
No sharper contrast between the Savannah and the Vanderbilt races could be given than afforded at this moment. Instead of a rush of thousands of people and cars out on the course, such as takes place at the conclusion of the winning of a Vanderbilt cup race, the Savannah course was as clear as the street scene drop which the vaudevillians describe as "Alexandria, Va., on a busy day." There was not a person on it. Even M. Garibaldi Coltelletti, representative and delegate from the Automobile Club D'Italia, loaded down with decorations and credentials and looking the part all over, was stopped by an impassive policeman when he tried to cross from the timers' stand to the Fiat pit to explode his exuberant congratulations. Other cars were still to finish, and until the race was called off by the referee the course would be kept clear.

HILLIARD'S LANCIA TAKING AN EASY TURN

During the chatter and tumult following Wagner's finish, most of the attention was directed beyond the line, looking for Wagner to return. Suddenly shouts of laughter and yells of encouragement went up when Hanriot's No. 15 Benz appeared before the grandstand with its motor silent and the car barely rolling toward the finish line, its two occupants humping back and forward together, trying to urge it along and shoving at the tops of the driving wheels with their hands. The car had run completely out of gasolene quite a distance down the stretch, but its momentum had been such that it had coasted in—so quietly, however, that very few noticed it at first. After a few despairing lurches and vigorous spats at the wheels, Hanriot and his driver found themselves over the line, the big machine coming to a standstill about four feet beyond the tape. The mingled laughter and cheers which were accorded the pair as they climbed out, met with a responsive grin from both driver and mechanic. Hanriot had landed fourth at the finish, and was satisfied.

HILLIARD AND EASTER ABREAST AT THE GRANDSTAND

Making his way back to the grandstand by an outsde road, Wagner shortly appeared at the Fiat camp. The discipline of the course was relaxed sufficiently to permit his car and himself being brought before the stand, where he was formally presented to the spectators as the winner, photographers and moving picture men busily training their batteries on him the while. The urbane Frenchman was given the congratulatory handshake by the governor of the state, the mayor and other officials, and went through it all with a smiling countenance despite the fatigue and physical soreness which the race had inflicted.



There were loud calls for Hemery, and the photographers and congratulators sought to lionize him also, but he declined to come forward, saying in French something to the effect that it was Wagner's victory and he should not be asked to "butt in," so to speak. He sat on the edge of the pits and turned his back on the "snapshot" men.

Hautvast, Strang, Rigal, Fournier and De Palma were allowed to finish, gaining places from fifth to ninth in the order given, and then the race was called off and the yellow flags waved around the course.

Digitized by Google

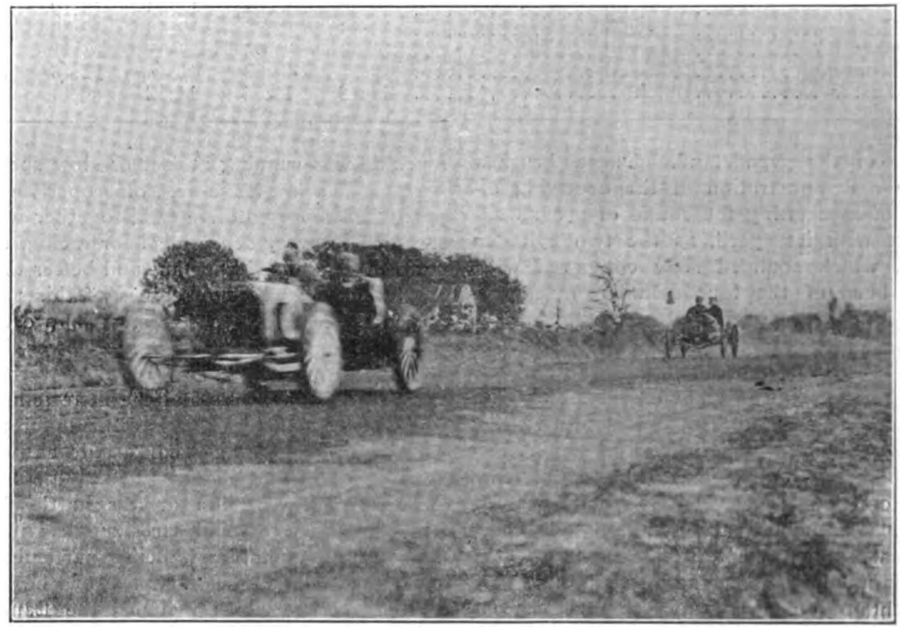
Duray, again at the wheel, arrived at the stand and was flagged, after which he submitted to further treatment for the gaping wound in his arm, preliminary to going to the hospital. It was thought that no permanent ill effects would follow his injury.

Light Cars in Fast Contest

LORIMER IN CLOSE PURSUIT OF HEARNE

Seymour in the No. 3 Simplex had completed fourteen of the sixteen laps when the running was stopped, making the longest run of any of the American cars, and gaining a theoretical eleventh place.

Replying to eager inquiries, Nazzaro explained that one of his tires went bad during the last lap. He had used the one set throughout, and was not surprised that at least one of them should give way. He might still have made a replacement and come in a winner had not the new tire which he put on gone soft almost immediately, compelling him to stop again and make another change. His tires cost him 6 minutes altogether. When he stopped on the road he was surrounded by soldiers and others, who were anxious to assist him and whom he kept back with difficulty. It was even charged that when his jack sunk into the soft earth and he was trying to move his car and raise the wheels, that several people gave him a helpful lift. Numerous citizens asserted this to be the fact, with such positiveness that Herr Neumaier, of the Benz interests, later lodged a protest against Nazzaro's being awarded third place, on the ground that he had received outside assistance contrary to the rules. But at the official hearing Nazzaro denied the charge and explained his difficulty in keeping the crowd away, whereupon Neumaier promptly withdrew the protest. Rumors of a protest against Hanriot, alleging that his Benz received fuel elsewhere than at the one authorized supply station, were also in circulation, but were not followed by action of any kind.



Serving as an appetizer for the big race, the light car contest on Wednesday attracted nearly everybody who had come to see the main event. Tickets to the grandstand had been sold on the basis of $3 for the two days, and those who had seats for Thanksgiving Day thus found that their coupons were good for the lesser event as well. As a result the stand was practically filled, but the roadside spectators were not overly numerous.

From a trade standpoint, the light car race was in many ways quite as interesting as the big race could be, as twelve of the fifteen contestants were of American makes enjoying more or less rivalry. The three foreign cars, too, by their presence indicated a trade tendency involving the effort to import small, medium price machines to bid for favor in the market against the domestic product. It was not a stock car race, however, which robbed it of some of the value it might have had as a comparative showing of well known models.

A smaller course than for the big race was used, being in the form of a rectangle 9.8 miles around, the cars being required to make 20 laps, or a total distance of 196 miles. The winner, a Lancia driven by Hilliard, covered the distance in 3 hours, 43 minutes, and 33 seconds, making an average speed of 52.6 miles per hour. The second car, a Buick driven by Burman, took 6 minutes and 12 seconds longer, while a Chalmers-Detroit won third place in 3 hours, 53 minutes, and 55 seconds.

Up to the tenth lap it looked like a walkaway for the specially built Buick, which had a 5 minute lead at that time, but a 9 minute delay put it back in second position and the Lancia was careful to keep it there. Examination of the record of the times later made it appear that the winning car had been held considerably below its speed possibilities during most of the laps, the driver preferring to open up only if it were necessary.

The short course brought the cars around with desirable frequency, sometimes three or four appearing together in the stretch and fighting their speed battles directly in

front of the grandstand. These brushes gave a demonstration of the deceiving effect of associating the sound of a car's exhaust with its speed, as the two cylinder cars, which sounded slow compared with the buzz of the four cylinder machines, could be seen forging along quite as fast as their more rapidly pulsating rivals. This fact attracted almost general attention and precipitated many psychological discussions among the spectators on the deceptive elements of judging rate of travel by impressions received through the eye or ear. The phenomenon served to prove that accurate mechanical means are generally necessary to make any proper estimate of how fast a car is moving. Even the position of the occupants of a car was shown to affect the observer's unconscious estimate of whether a machine was running at fast or slow speed.

Having such a large field of properly prepared and representative cars, together with a course in every sense ideal for racing, the contest was more important and better than most races in which machines of this type are entered. The speed attained was worthy of cars of much greater size and power, but the spectators were so far removed from the path of the racers and the little fellows looked so small, that it was difficult for the crowd to develop more than a mild enthusiasm.

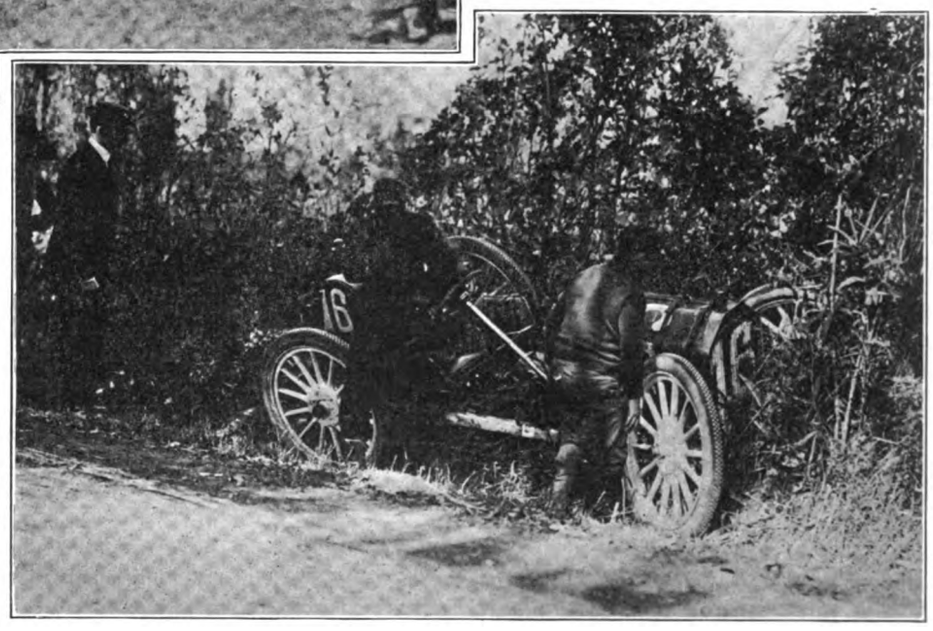
Most of the foreign drivers in the big race watched the small car struggle with a great show of interest, being particularly concerned about the fortunes of the imported entries, which included the Lancia, the Isotta and the S. P. O., which latter had been repaired just in time to start. It was Nazzaro himself, who in broken English sought a telegraph operator at the conclusion of the race, in order to send to Lancia in Italy a cablegram of congratulation signed by the drivers of whom he was once the team mate.

After wandering through the mazes of the wire fences, boarded pathways, turnstile gates and other devices for filtering the ticket holders into the proper channels and getting them to their seats, the first-time visitor at the Savannah course emerged from the lower caverns of the grandstand to a view of the long stretch of course in either direction. Under the brilliant sun the roadway glistened with oil, and looked so smooth and broad as to suggest almost unlimited possibilities for speed.

Digitized by Google

Gathered in front of the stand were a fleet of spidery looking machines, most of which appeared to have red bodies and white wheels. Their drivers were in nearly all cases working away at adjustments and final preparations. Shortly before 11 o'clock the cars were swung into two lines, in numerical order, and Starter Wagner prepared to send them off. The No. 1 S. P. O., which on the previous Saturday had suffered an accident which resulted in the death of its mechanic, Marius De Rosa, and injury to Jean Juhasz, its driver, was at the head of the line. By hard work it had been put in running condition again, the work being completed only a few minutes before the start.

BURNS WRECKED



At half-minute intervals the cars were released, there being a lively racket of running motors, from the light hum of the "Baby Isotta," with its four tiny 2⅝-inch cylinders to the loud reports of the 5-inch two cylinder Maxwell engines. Following the S. P. O. came the No. 2 Lancia, which glided away very quietly, with muffled exhaust. The first American car was the No. 3 Chalmers-Detroit, driven by Louis J. Bergdoll, of Philadelphia, a millionaire through the brewing business and an automobile dealer and driver by inclination. There was a one-minute wait before the No. 5 Cameron, the only air cooled car in the race, was sent away. K. R. Manville, whose "American Aristocrat" had been assigned No. 4, had sent word that his speaiclly designed machine would not start.

When the "Baby Isotta," No. 6, driven by Al Poole, came to the line there was much amused interest in its high pitched engine sound and its low body lines, but it went singing up the course in pursuit of the others in a very business-like way. The No. 7 Gregoire, which Robertson was to have driven, having been withdrawn, Burman's No. 8 Buick was next, its underslung suspension making the wheels seem very big and giving the machine a racy appearance. No. 9 was Arthur See, in the first of the four Maxwells. Lorimer in a Chalmers-Detroit was No. 10, and another Buick, driven by Hearne, bore No. 11. The second Maxwell, a Chalmers-Detroit, a Buick, a Maxwell, another Buick and the last Maxwell completed the list.

First to appear in the stretch at the end of the initial lap was the Lancia No. 2, followed by Bergdoll's No. 3 Chalmers. Soon thereafter a car was seen coming at a surprisingly fast rate, and when it proved to be the No. 8 Buick the grandstand occupants set up a mighty cheer, as Burman had overtaken both the No. 5 Cameron and the No. 6 Isotta. The latter had gained on the Cameron, however, and crossed the line first. The remaining cars arrived in mixed order, the No. 1 among them, all but No. 13 Chalmers-Detroit completing the round. The hoodoo of its number had sent it into a tree at Montgomery cross roads, Burns, the driver, being slightly injured. He shed four teeth in the smash, but neither he nor his mechanic suffered serious results.

Again Hilliard in the No. 2 Lancia led over the line, with Burman's Buick right astern, having nosed out Bergdoll's No. 3 Chalmers which followed. The sight of three cars abreast coming at top speed in the stretch brought the onlookers to their feet. The "Baby" Issotta was in the center, flanked on one side by Hearne's No. 11 Buick and on the other by Lorimer's No. 10 Chalmers, both of the latter towering considerably above the infant in the center. Nevertheless, the little fellow asked no odds and gave them both a tussle. The No. 12 Maxwell, which had not finished its first round before the leaders had passed on the second, was again tardy, and the No. 1 S. P. O. was missing from the field.

By the beginning of the third lap the contestants were pretty well strung out, and in the fourth and fifth laps those in the forefront were worming their way through the ranks of the tail-enders of the previous rounds. At the end of the fifth lap, the Cameron drove up to the pits, and after its driver and mechanic had worked on it for some little time, the machine showed no signs of being in condition to resume, so it was wheeled out of the way. It was reported that the crank shaft was bent and the clutch burned out.

JEFFERS DITCHED

Patriotic joy was manifested by the enthusiasts in the grandstand when Burman's No. 8 Buick speeded ahead of the No. 2 Lancia in the stretch for the finish of the sixth lap. Yells and cheers encouraged the American car to leave the Italian product as far in the lurch as possible. In the seventh, eighth and ninth, the Buick still led, with the Lancia following next, but

Digitized by Google

apparently losing ground. Only the No. 11 Buick, the No. 10 Chalmers and the "Baby" No. 6 were now able to count themselves as on the same lap with the leaders, all the others being one or more laps behind.

No Buick preceded Hilliard's Lancia on the tenth round, the car purring along in happy fashion all by itself. The lead of five minutes which the Buick had enjoyed was lost, and not until about seven minutes later did it appear, having taken 19:08 for the round as against 10:42 for its best previous lap. A lost rod nut had made it necessary for Burman to stop. The Lancia's net time showed an advantage of about four minutes.

For the next three rounds Burman set a furious pace, going faster than before, in his efforts to overhaul Hilliard, but in the fourteenth round he got another setback, in a stop which required a full five minutes. His fifteenth lap was slow, also, so that for the fourteenth, fifteenth and sixteenth rounds the No. 10 Chalmers, driven by Lorimer, was in second position, in point of time. The seventeenth lap brought Burman back to second place again, however, but although he drove to the limit of his car, finishing with a broken spring and a gasolene tank so loose the mechanic had to hold it in position, he was unable to get even a peep at the flying Lancia until the race was over. The Chalmers resumed its third position, which it did not relinquish.

From the twelfth lap to the finish, the relative positions of the five cars following the No. 10 Chalmers were unchanged. Hearne in the No. 11 Buick was unable to pass the Chalmers in spite of a hard fight and was kept in fourth place; Poole in the "Baby" Isotta held fifth from as far back as the eighth lap; See, in the No. 9 Maxwell, maintained sixth from the same point; Kelsey, in the No. 17 Maxwell, stuck to seventh, and Costello, in the No. 12 Maxwell, was in eighth place, until the race was called off.

Hilliard made only one stop during the whole 20 laps. He halted a moment before the grandstand to let his mechanic grab two cans of oil from the pits and rush back to the car, when he started off again. The mechanic was seen to take the cap off the oil tank and begin pouring in oil while the machine was gaining its full speed. Bergdoll in the No. 3 Chalmers got in the habit of stopping at the pit almost every round. His leisurely, millionaire manner of climbing out and deciding what it was he wanted to do, occasioned considerable humorous comment. After several stops he seemed to become enamored of the place, and could not be coaxed to start out again.

At about the middle of the race, Jeffers's No. 16 Buick, which had failed to come around after the second lap, made its appearance in the stretch, but running slowly with its two front wheels wobbling uncertainly. In the car the mechanic was holding up a badly bent cross rod of the steering mechanism, a makeshift substitute having been installed so that the machine could get back to the grandstand. The machine had gone off the road into the bushes, but without injury to its occupants.

By far the most serious accident of the day occurred to the No. 14 Buick on its fourteenth lap, as the car was rounding one of the sharp, banked turns on Estill avenue. The right rear wheel came off, sending the machine over the bank into the deep ditch. The driver, Hugh Easter, was no more than badly bruised, but his mechanic, Frank A. Thompson, was hurled into the road, where he rolled over and over after a long slide. He was picked up for dead, but medical treatment brought him back to consciousness before a great while. His injuries were serious, but not dangerous.

Other cars shed tires and cut a few minor capers, but ten of the fifteen were running when the yellow flags went up, although the No. 1 S. P. O., which insisted upon being counted as among those present, had only completed about four laps. The No. 15 Maxwell, driven by Munweiler, claimed ninth place, having made fifteen laps and being on its sixteenth.

When the official time for the first seven cars had been taken, and the race was announced as over, there was a lively rush on the part of the spectators to get back to the center of town, where restaurants could be found, as many had fasted since morning. The winning car was put on exhibition in front of the De Soto Hotel, where it was surrounded by large crowds until midnight. Meanwhile, the stolid negro convicts were put at work, repairing the course for the big event next day.

Fritz Erle, the unfortunate driver of the No. 19 Benz, built his own racing machine. He is a designer in the Mannheim factory and knows the Benz as no other driver can. With his own hands he assembled the car which he drove in the Grand Prize contest, and until the loose non-skid tread of his tire knocked him senseless, was well in front.

To reach the steamers which brought many New Yorkers and their machines to Savannah, it was necessary to cross the cotton wharves, where countless thousands of cotton bales are piled and where to be caught with a lighted cigar or cigarette means summary arrest. The police were kept busy warning visitors as to the regulations. Nevertheless, a dangerous conflagration was started on the wharves when some forty cars were driven to the docks for loading on the steamers after the race. One of the drivers lighted his lamps and threw the match on the ground where there was a pool of gasolene drippings. Oddly enough the owner of the car happened to be an insurance man. By a wise provision the Marten fire patrol had accompanied the cars, and one of its chemical tanks promptly extinguished the flames. The contemplation of the fire horror possibilities of the cotton wharves which the incident provoked resulted in the motorists taking extra precautions thereafter.

Had they really represented any papers, two press-stand victims of Military Commander Major William B. Stephens would have made that autocratic gentleman suffer for the abrupt and uncompromising manner in which he gave them the lash of his rigid discipline. After the shock of their encounter with him was over they filled the press stand with their wails, calling upon the gods to witness in Stephens the worst ever, and threatening to make him squirm when they should "hand it to him" in their dispatches to the "War Cry" and the "Police Gazette," respectively.

The unhappy sufferers were "Ned" Broadwell, of the Fisk Rubber Co., and L. D. Rockwell, the Metropolitan representative of the Standard Welding Co., both of whom were adorned with press badges as the representatives of a mythical "Michigan Syndicate, of Detroit." Their passes to cross the course limited them to the path from the grandstand to the press box, but their hasty reading of the wording construed a larger liberty, in fancied possession of which they wandered a-down the course beyond the dead line which the police and militia were maintaining.

They were promptly "nailed" and brought before the imperious major, who demanded that they give up their badges and get off the course altogether. To their first outburst of protest, he bellowed, "Not a word, or you go to the barracks!" The policeman who held them gripped a little more viciously, too, because unhappily he had been referred to as "this guy," when the protest was started, and the pair were distinctly "in bad" for the moment. Their personal friend, Robert Lee Morrell, the referee, being close at hand, they looked to him for help, his contribution being a friendly "You are doing quite right, officer."

Rescue from other influential sources came to hand, however, just in time to save them from ignominious ejectment, and when the vindictive policeman released his grip they hastened to get into the press stand, to which they stuck till the race was over.

Motor Parkway Time Trials Off.

As might have been expected, the foreign and American drivers who participated in the Grand Prize race, will not be seen in any series of time trials on the Long Island Motor Parkway, as had been planned before the Savannah event took place. The date set for the short distance speed trials, which were to be held under the auspices of the Long Island Motor Parkway Inc., was December 5, but inasmuch as the foreign cars were brought here with the understanding that they should participate in no other race than the Grand Prize, the time trials have been abandoned.

BARS CIRCULAR TRACK RACING

A. A. A. Resolves to Discountenance Speed Contests on Short Courses—Proceedings at the Annual Meeting.

After prolonged deliberation lasting over two years the American Automobile Association has added one more proud distinction to its diadem by solemnly condemning automobile speed contests on circular tracks built for horse racing and of a mile or less in length, and declaring that it will have nothing whatever to do with them in future. By this means the question of whether or not races shall continue to be held over circular tracks is left discreetly to promoters of such contests who may choose between abandoning them or braving the mild taint of outlawry at the hands of the governing body.

The passage of resolutions endorsing this action was the most important feature of the sixth annual meeting of the association, held Monday last, 30th ult., at the national headquarters, New York City. Two protracted sessions were held; the morning one being that of the outgoing directors, and the afternoon a preliminary meeting of the the new board that took office on December 1. Both gatherings were largely attended; that in the afternoon including forty representatives of as many affiliated clubs. The anti-track racing resolution which was adopted after a prolonged discussion, is as follows:

Whereas, Automobile speed contests on circular tracks built for horse racing has ceased to serve any useful purpose; and whereas, such contests do not have the approval of the general public or any considerable portion thereof; be it

"Resolved, That speed contests by automobiles on circular tracks built for horse racing and of a mile or less in length be condemned by this Association; and be it

"Resolved, That hereafter this Association have nothing whatever to do with such contests."

In order to start "a binding force between the national body of individual motorists," as the Board of Directors terms it, the publication of a monthly official journal, is contemplated. The matter has been placed in the hands of a temporary publications committee.

Secretary Elliott's report was filled with statistics that showed among other things, that only 24 sanctions for track contests had been granted during the past year, as against 52 in 1907, while on the other hand 20 sanctions were granted for hill-climbs against 5 of the previous year. No data as to the number of unsanctioned or "outlaw" meets was presented.

In the matter of membership, the report boasted 25 state associations as compared with 16 a year ago and 187 clubs numbering 20,000 members, against the 1907 list of 132 clubs of 17,000. Practically all of the northern states with the exception of Maine, New Hampshire and Iowa are now federated into state associations. Similar associations exist in California, Colorado and Oklahoma, while movements looking to state bodies are already under way in Iowa, Arkansas, Montana, North and South Dakota, Washington, Oregon, Louisiana and several other states.

President Hotchkiss' bulky valedictory touched upon the vital subjects of affiliation, otherwise the "national idea;" the growth in membership; and the leading events of the past year. Among them were cited: The good roads convention held at Buffalo last July; the practical endorsement by the National Grange of the legislative program of the Association; the decrease in track racing and increase of hill-climbing contests and the reciprocal relations established between the A. A. A. and the Motor Union of England, Automobile Association of London and the Touring Club of France in the matter of touring facilities. He concluded with a hearty tribute to the score or more of active men who had co-operated with him in his administration, saying that in the lfe-long friendships whch he had made, lay the compensaton for his work while in office.

Denver Climb Now Set for December 5.

December 5 is the date to which the Denver (Col.) Motor Club's hill climbing contest originally set for November 21, has been postponed. Lookout Mountain is to be the scene of the competition and as the course is nearly three miles in length and includes a maximum grade of 21 per cent. for a good part of the way, the Denverites expect to see a rather strenuous contest. The festest cars in each class will be declared winners, without resorting to high mathematics, piston area not entering into consideration.

New Date for Worcester Endurance Run.

The reliability and endurance contest of the Worcester (Mass.) Automobile Club, originally scheduled for December 8, has been postponed to Saturday, December 12. The exact route has not been decided upon as yet, but will be for a distance of about 200 miles, over five 40-mile trips radiating from Worcester as a center. Stringent rules will be maintained and at the close of the run a technical committee will examine minutely each "perfect score" car in order to determine the winner.

Oldfield Troupe to Perform at Tanforan.

Oldfield, Christie & Soules, star performers, will make their Pacific Coast debut on Saturday and Sunday, December 5 and 6, at Tanforan Park, San Francisco, Cal., where they will present their high class hippodrome act. The track meet will be under the auspices of the Automobile Dealers' Association.

HOTCHKISS AGAIN HEADS A. A. A.

Elliott Re-elected Secretary—Other Officers Chosen, Chairmen Appointed and Executive Committee Named.

After repeatedly declaring that he would not run again for office, Judge William H. Hotchkiss, of Buffalo, changed his mind at the meeting of the directors of the American Automobile Association yesterday (Wednesday), and was re-elected president. The other officers chosen for the ensuing year are: First vice-president, Lewis R. Speare, of Boston, Mass.; second vice-president, Ira M. Cobe, Chicago, Ill.; third vice-president, Frank M. Joyce, Minneapolis, Minn.; treasurer, H. A. Bonnell, East Orange, N. J.; Frederick H. Elliott being re-elected secretary.

Chairmen of the following boards were immediately announced by President Hotchkiss: Legislative board, Charles T. Terry, New York; Good Roads board, C. Gordon Neff, Cincinnati, O.; Contest board, F. B. Hower, Buffalo, N. Y.; Touring Information board, Powell C. Evans, Philadelphia. The following executive committee, in addition to the president, first-vice-president, secretary and treasurer and board chairmen, was named:

S. A. Miles, New York; H. O. Smith, Indianapolis, Ind.; William E. Metzger, Detroit, Mich.; Oliver A. Quayle, Albany, N. Y.; Paul C. Wolff, Pittsburg, Pa.; W. C. Crosby, East Orange, N. J.; James T. Drought, Milwaukee, Wis.; C. H. Gillette, Hartford, Conn.; Frank G. Webb., Brooklyn, N. Y.; Frank M. Joyce, Minneapolis, Minn.; J. P. Coghlin, Worcester, Mass.; L. E. Myers, Chicago, Ill.; Edwin S. George, Detroit, Mich.; John Bancroft, Wilmington, Del.; L. J. Powers, Jr., Springfield, Mass., and H. M. Rowe, Baltimore, Md.

In line with the policy announced some time since, the A. A. A. practically washed its hands of racing altogether by doing away with the racing board and vesting the functions of this committee in the contest board, of which Frank B. Hower, the czar of the last two Glidden tours, is chairman.

Denmark Limits Motoring at Night.

Danish motorists are considerably aroused over the provisions of an automobile law which recently came into force and which it is hoped to revise by a bill to be introduced into the Rigsdag before the end of 1909. The unpopular provision includes among other clauses a prohibition to drive at night except along roads entirely illuminated, from half an hour before sunset until half an hour before sunrise, and from August 15th to May 1st, inclusive. The speed limits are fixed at two Danish miles per hour for Copenhagen, which amounts to something like 9 English miles an hour, and in the open country at 4 Danish miles.

RATING BY THE CYLINDER VOLUME

Riker Advocates Limitation of Stroke as Well as Bore—He Shows Disadvantages of the International Rule.

In explanation of the appearance abroad of a considerable number of "long stroke" engines as well as in some measure of defense of the method of rating adopted some time since by the Mechanical Branch of the Licensed Association of Automobile Manufacturers, Andrew L. Riker, its president, and also designer of the Locomobile winner of the recent Vanderbilt contest, has issued a statement dealing with rating in general and with the A. L. A. M. formula in particular. In this connection he also points out the inevitable trend which must follow the general adoption of the new definition which has been established by the European clubs of abnormally long stroke dimensions, which, he predicts, will be of practically no use for other than racing purposes.

"It is useless to expect that any large body of designers will ever be thoroughly in accord on any subject involving so many opportunities for detail differences as motor design," says Riker; "though years of experience have resulted in evolving a type of construction followed so closely in such a large number of instances as to warrant being termed current practice in this respect. . . . .

"The point might be made that a few of the racers built abroad for the 1908 season did not have abnormally long strokes. It is reported that the winner of the Grand Prix had cylinders of 6.09 inchs bore and of 6.69 inches stroke. But it must be considered that a 6.1 bore is large, a real racing dimension in itself; and in this case it was not found necessary to lengthen the stroke very much. Now for 1909 the bore is greatly reduced and in order to make a fast car, the designer is almost certain to build a very long stroke motor, like in the cars in the 4-inch race in England, or the voiturette race in France.

"What is to-day the position of the American manufacturer who has a desire to build a car that can win the Grand Prix of 1909? Simply this. He must build for racing purposes only, one or more freak cars. He cannot compete successfully with the foreigners unless he does. If he does not lengthen the motor stroke to some absurd length, his cars will not have the speed of the foreign cars; he will not be racing on equal terms with them, and will be beaten.

"Is it too late to gain a reversal of the rule? If the cylinder volume instead of the bore only, could be limited, it is certain that a large number of splendid fast American racers would be built and their performance prove the mettle of the American designer in a more impressive and conclusive manner than ever before. The present situation is more than unsatisfactory, but if it can be explained and thoroughly understood, that much at least will have been accomplished.

"There is obviously only one accurate way of determining the effective horsepower of any particular engine, and that is to try it on the brake. For the purpose of a general rating formula, an approximation, the only thing possible as well as sine qua non, will suffice. Owing to the many variable detail factors which affect the power developed by any engine, the whole subject is complex, and necessarily somewhat vague; and in one way, as evidenced by the views of people of varying experiences, experts, et al., controversy thereon is interminable.

"The A. L. A. M. horsepower formula was adopted after much consideration by, and the almost unanimous opinion of, the Association engineers. And I have been continually gratified by its adoption. Various bases for a standard rating were considered. Finally a formal vote of all the engineers was taken on the question of what is a fair conservative rating for a given size four cycle (single acting) motor at a given piston speed. One thousand feet per minute had previously been agreed upon as a proper piston speed to assume. The average view was so nearly in accord with the results of the formula theretofore adopted by the Royal Automobile Club of England (the diameter of the piston squared, multiplied by the number of cylinders, divided by the constant two and one-half, equals horsepower), that it was decided to adopt this formula; conforming to an existing standard, so avoiding further confusion in a subject it was sought to clarify. Superficial critics of this formula at times fail to bear in mind that the application of the formula recommended by the Association of Licensed Automobile Manufacturers, is based on one thousand feet per minute piston speed. Neither ought to be necessary to point out that a motor developing on the block, 33 per cent. more than the required power by the formula, is no occasion for surprise; it is looked for.

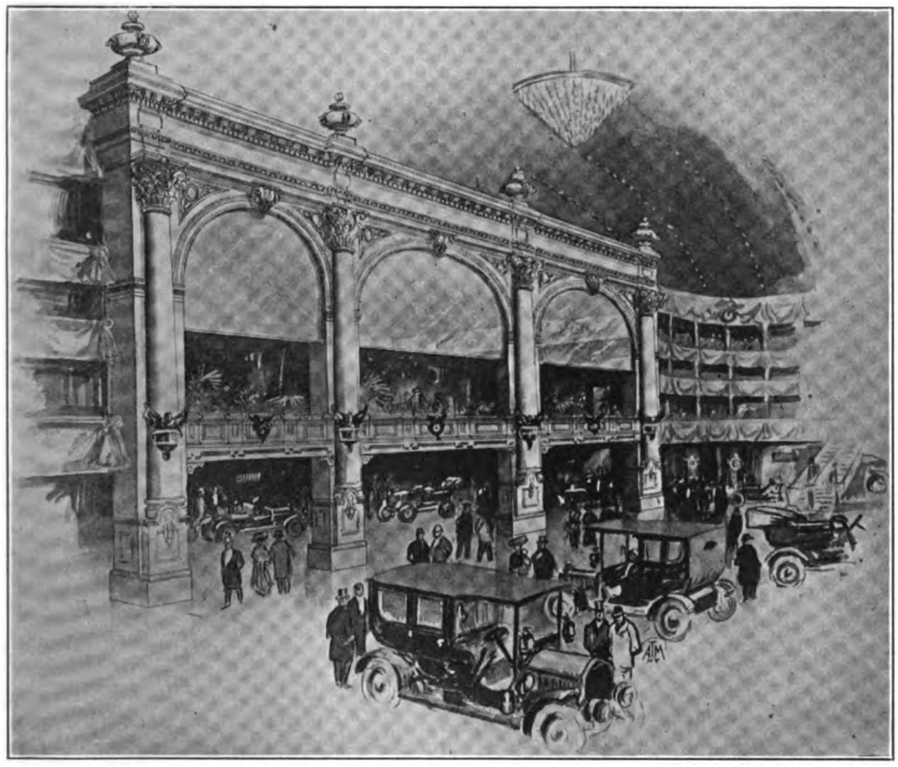
"The A. L. A. M. horsepower formula was not intended primarily to be used in racing, but there is no reason why it, or an analogous principle, cannot be used equally well as a basis of contests of any character. We see in the recent 'four-inch' race in England, in the decision to limit only the engine bore of cars entered in international racing, and in specially costructed single cylinder racing cars abroad, a marked encouragement of cars which would never be built for touring purposes only. The obvious sensible way of limiting the power of a racing motor is to limit the cylinder volume and not the bore or the stroke alone. The limitation of the engine bore under the Grand Prix rules is very wise, but the stroke also should have been limited; for engine strokes of freakish length are the inevitable result. The amount of compression pressure should also come in for consideration.

"All racing cars built abroad for the season of 1908, by virtue of an international ruling, were restricted in design as to their cylinder bore. For the Grand Prix and other events, intended for large cars, the bore was 6.1 inches; for the English Isle of Man contest, the limitation was 4 inches —thus the name, "Four Inch Race.' Similarly the bore of the cars constructed for the small car race run on the day preceding the Grand Prix were restricted. In spite of these limitations the cars were speedy and notably high averages were made. In fact the average time made by the winner of the Brescia Circuit is a new record, faster work than has ever been accomplished before with a motor of unlimited bore and stroke. The Grand Prix was won at an average of 69.2 miles per hour; the voiturette race the day before the Grand Prix at an average of 50.02 miles per hour.

"At first thought it would appear that the tendency to limit the size of racing motors in this manner is admirable, but when a study is made of the strokes of the foreign racing cars of 1908, it would appear that many of the motors are in reality freaks, particularly when it is considered that the short stroke motor is gaining ground all the time and that a few years ago when the bore was unlimited, the foreign designers made the stroke short in preference.

"For 1909 the Europeans have decided to reduce the bore still further, from 6.1 inches to 5.1 inches. It was hoped that some limit would be placed on the stroke because the Automobile Club of America in reply to the request of the racing powers abroad, advised a classification by volume, a most sensible thing. The wisdom of this plan should be obvious to all; it not only places four and six cylinder motors in the same class, but it encourages rational motor design and the building of cars that will have a commercial value after the races are over. A four cylinder motor of 5.1 inches bore and a reasonable stroke, say six inches, is a very good size. A manufacturer could easily turn such a racing car into a stylish and speedy roadster with little trouble; the result would be a car containing all the value racing can offer in the way of experience; and instead of a freak, would be a new logical model, perfectly tested. Just what a 5.1-inch motor with an extravagantly long stroke would be good for after the racing season, with the rules changing every year, is difficult to see."

Advantages of Covers for Lamps.



Aside from its advantage in preserving the polish of the exterior, the use of rubber or other protecting covers for dash and tail lamps is advisable since it tends to exclude mud and dust from the air outlets when the lamps are not in use. Otherwise they are liable to clog up with the result that the draught is very poor when they are lighted and considerable difficulty may be found.

TRIUMPHAL ARCH FOR GARDEN

Decorative Scheme for the Show—Colossal Background that Apparently will Increase Area of Amphitheatre.

Like the elaborate "drop" which forms the background of a stage picture the decorative treatment of the Fourth avenue or rear end of Madison Square Garden always has been one of the chief cares of those who have arranged the settings for the various automobile shows which have graced that structure. Schemes embracing a wide variety of motives have been adopted and

TRIUMPHAL ARCH FOR THE GARDEN SHOW

marvelous as well as costly effects secured. That the range of possible variety has not yet been exhausted, however, will be proven beyond a doubt, when the doors of the vast arena are thrown open on January 16th upon the "Ninth National" show of the Association of Licensed Automobile Manufacturers. For this the most massive single piece ever introduced into the Garden will be utilized. It is to be a triumphal arch of colossal proportions which will occupy the entire end of the building, as shown by the picture.

Official figures as to the magnitude of the decoration give its height as 87 feet, and its total breadth as 48 feet. It will be supported by four Roman-Corinthian columns, each 3½ feet in diameter, one-fourth of each column being imbedded in the arch and three-fourths standing in free relief. Between the columns will be three bays, their arches just beneath the cornice and their bases at the balcony rail. In these bays will be massive plate glass mirrors, the center one twenty feet in width and each side one 19 feet across. These mirrors, being set at an angle with the tops inclining forward, will double the view of the whole interior of the main floor of the ampitheatre. On top of the arch, above each column, will be a huge decorative urn, while swinging on chains against the face of each column, at the balcony level, will be great bronze lamps, while liberal use will be made of smaller individual bulbs. The balcony face, which is all in plaster, will be set off by one of the "eagle-on-a-wheel" emblems, which will form an important part of the decorating scheme. This triumphal arch will be a sort of background and support to the whole decorative layout of the main floor of the Garden, the decorations in the foreground being subordinate to it in their height.

Statistics of the Olympia Show.

Final statistics of the Olympia show in London, which closed last Saturday, 21st ult., show that 525 vehicles were on exhibition including complete cars and the chassis of pleasure cars only. Of these 511 were gasolene propelled, 2 electrically and 12 were steamers. Eight foreign nations were represented in the products, the total foreign showing almost equaling that of the domestic product. The very general decline in the use of chain drives was shown by the fact that out of 140 stands, only 23 staged chain driven machines. The actual numbers of chain and shaft driven models were respectively 54 and 467.

PARIS SALON SHORN OF SPLENDOR

President Fallieres Rides Behind Horses to the Opening—Prominence of Light Chassis an Interesting Feature.

Perhaps it was significant of changing conditions in the Parisian capital that President Fallieres arrived at the Grand Palais in a horse drawn vehicle on Sunday morning last, instead of in an automobile. His visit was the occasion of the opening of the eleventh annual Salon, and the circumstances was widely commented upon. The ceremony of the official opening was attended with the usual pomp and pagentry.

Of the show as a whole, it is fully admitted that the former days of superlative grandeur have given way to a period of almost sombre economy. Among the decorations, from the embellishment of the Grand Palais itself, to the mountings of the individual exhibits, many of which are reproduced from last year, there is less of the flamboyant tone of former shows. The external decorations are concentrated at night upon the exhibition building itself, and the effect secured is at once novel and pleasing But the blaze of light which used to greet the visitor is no longer found.

Due both to the fact that there are fewer exhibitors than heretofore and that there is a dearth of startling developments, the show is further robbed of its old supremacy. Among mechanical achievements, practically the only mechanism of noteworthy significance is the Silent Knight engine which has been tentatively adopted by several of the European makers.

Whatever of "trend" is discernible from a hasty first glance at the exhibits leads to the impression that the annual buyer is being catered to more than ever before. Or, which is the same thing, that the vehicle of medium and low price has attained a vogue which is wholly without precedent. The light chassis of many of the old line makers are receiving due comment both for their excellence and the very fact of their existence. Two and four-cylinder models suitable for either runabout, touring or cab service are in great abundance. These, indeed, constitute the real feature of the show. Aside from these, however, several improved six-cylinder models are to be found, while for the limited field which is still discernible in the market for luxurious machines, the French body makers have outdone themselves in hitherto unequalled attractions.

In the field of accessories the flood of novelty and eccentricity appears to flow on unchecked, despite the unstable condition of the car building sections of the local industry. It is yet too early to compare this section of the show closely with corresponding portions of previous Salons, but the first impression is that it compares favorably with them.

STEPPING TOWARD UNIFORM LAWS

New England Governors-Elect Derive Light from Boston Convention—Automobiles and Good Roads Discussed.

First fruits of the convention of governors held in Boston on Monday and Tuesday of last week, are expected in the form of recommendations from the respective governors-elect of the six New England states in connection with their inauguration speeches on January first. In common with the movement for universal state laws and the conservation of the natural resources of the country, which formed the chief topics of discussion the regulation of the highways and the control of automobile traffic came in for due consideration. The movement for a uniform enactment for the government of the motorist received a welcome impetus in this connection.

Among the definite requirements cited by the various speakers were: the abolition of speed traps, which were characterized as "local political affairs"; the appointment of state officers whose duty it shall be to regulate the speed of automobiles; a law requiring that all vehicles carry a light when on the road at night and the "taking off the road of the reckless and drunken operator."

Speaking of the imperative necessity of fostering the movement for improved highways, ex-Governor Batchelder, of New Hampshire, said:

"Whatever else is done to promote the mutual interests of the New England States, there must be established a system of interstate highways which will render the most remote districts accessible to tourists.

"The farmers believe that this is a purpose to which a part of the national revenues derived from taxes paid largely by them should properly be devoted, and they insist that the highways of the country are entitled to as much consideration as our waterways. They realize that the financial condition of many of the states will not permit of their making the large appropriations necessary to meet the urgent demand for better roads, and, therefore, are endeavoring to secure recognition of the principle that Congress should by legislation provide a part of the funds needed for road improvement.

"Closely allied to the question of good roads is that of the regulations governing the use of the highways by automobiles.

"The extent to which this right was disregarded by reckless drivers of automobiles, forced the farmers in self defense to seek legislation fixing the rate of speed of these vehicles."

Definite suggestions as to the requirements of a universal law were made by Francis Hurtubis, Jr., counsel for the automobile associations, speaking from the floor, who ventured the opinion that a uniform law suited to the general requirements of all could be constructed out of the best elements of laws already existant. He enunciated six cardinal principles as requisite to such a measure. First among these he placed the requirement for universal lights upon all vehicles.

Uniformity of the clauses relating to the operation of motor vehicles by non-residents of the respective states; the elimination of local restrictions in favor of the general law; the abolition of "traps"; the absolute control of all questions of the administration of the motor vehicle law by state officials, properly constituted, as for instance, the highway or road commissions; and the reduction of the speed laws to a uniform basis; were the other points he emphasized.

"My opinion is," he said, "that if each of the New England States were divided into a number of districts, each district in charge of a state police officer having under him one or two or more assistants, all mounted on motorcycles, whose duty it was to prevent fast or reckless driving in their respective districts, I believe the problem would be better solved than by a few towns establishing and working 'traps.'"

Formal addresses were made by Harold Parker, C. E., delegate to Paris International Congress on Roadbuilding, and chairman of Massachusetts highway commission, who spoke on "The Construction of Highways"; James H. MacDonald, president American Roadmakers' Association, and commissioner of highways of Connecticut, whose topic was "Trunk Lines of Highways for New England," and Nahum J. Batchelder, master of the National Grange, Patrons of Husbandry, and ex-Governor of New Hampshire, on "Automobiles and Their Regulation."

Restricting Vehicles on Yale Campus.

Yale campus is to bar automobiles during a large portion of each week. The new regulations provide that the college grounds at New Haven, Conn., shall not be open to machines except from 1 to 4 p. m., on Tuesdays and Thursdays, and from 10 a. m. to 1 p. m. on Saturdays. The restriction also applies to other vehicles as well, including milk and laundry wagons, express carts and the like. It was claimed that the constantly increasing traffic on the campus disturbed the students at their recitations.

Insurance Men May Bar Night Riding.

A clause to exempt the insurance companies from having to pay on automobile policies where the accidents occur between midnight and 6 a. m., is a recent proposal, due to the results of "joy riding" mishaps. A number of underwriters have prepared statistics on the subject and claim to find that a big percentage of the automobile accidents take place "at an hour when the daredevil spirit rages," which, more specifically, is after midnight.

ADAPTING TAR TO USE ON ROADS

Why It has Proved Injurious in Some Localities—Elimination of Soluble Elements a Necessity.

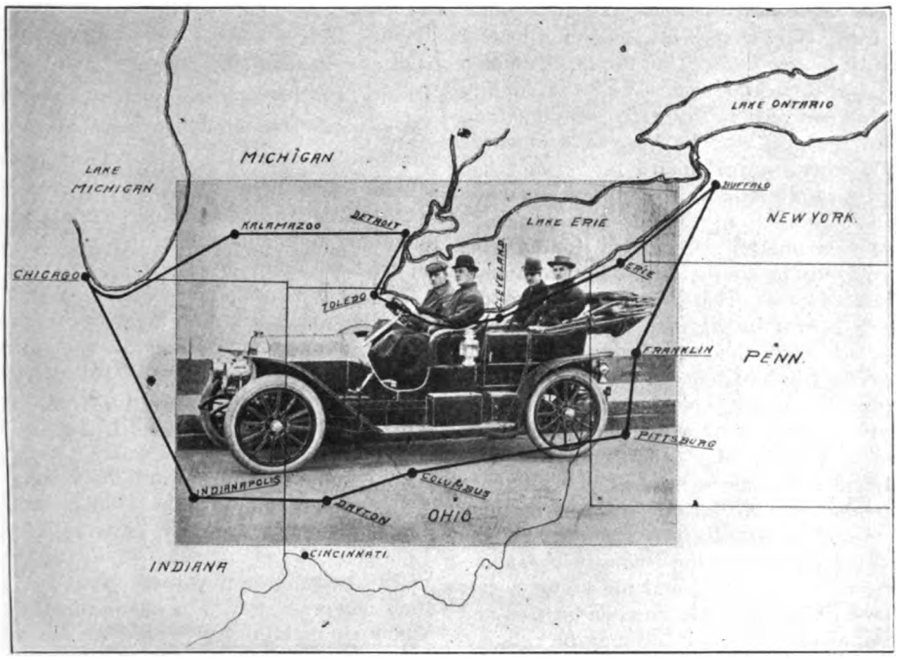
French prejudice against the use of tar is not shared by English road experts. It is thought that the baneful effects the tarring of Paris boulevards had on the neighboring trees and shrubs was due to the fact that the tar used had not been properly prepared to free it from its soluble components and that the latter, which are very harmful, washed out with the sprinklings and rains and attacked the roots of the surrounding vegetation.

On this point a British authority, Colonel Crompton, says: "Tar fresh from the gas works is totally unsuitable for using on the roads. It contains a proportion of soluble matter which may run off with the surface water and do considerable injury, even killing fish if it gets into streams. Then, too, the ordinary tar splashes and ruins dresses and fabrics. These facts have caused considerable prejudice against tar preparations among many land owners and country residents. Methods had to be found of removing the soluble matter without going to the other extreme and making the coating brittle. There are now various ways of doing this.

"The Roads Improvement Association's experiments showed that roads can be made dustless by applying one gallon of tar to every four superficial yards, costing about $200 a mile for an average road,. We found that satisfactory results could only be had by giving much heavier dressings than were formerly considered necessary.

"This tar dressing so adds to the wear-resisting qualities of the highway that so far as can be now seen it will more than repay its cost by the saving it effects in road maintenance. But it is not possible to speak finally on this point until the tarred roads have been laid down for a longer period."

Steamboat Aids in Hill Climbing.



Assistance in difficulties is sometimes obtained from the most unusual sources, as was impressed upon a western motorist when his machine encountered a terrifically steep hill at Blueslide, Washington. The hill is one of the worst in the section, both in steepness and in the slippery condition of its surface. The car was unable to negotiate it, but the captain of a river steamer which was lying at the adjacent wharf came to the rescue. He fastened a tackle block at the top of the hill and attached a line to the touring car. The other end of the rope was wound around the steamboat's capstan, and all hands were piped to the fore deck. With a yee-ho the capstan was revolved and the motor car climbed.

LONG TOUR AS A DEMONSTRATION

New Stoddard-Dayton Model Covers Route of 2,164 Miles—Traveling Exhibit Visits Cities in Five States.

One time, makers and agents were quite satisfied when a prospective customer could be given a demonstration run over local highways amounting to not over 10 or 15 miles, so long as it passed off without criticism. Changing conditions have brought about a situation in which, though the popularity of the agents' demonstration to the individual prospect is passing into more or less restricted status, the manufacturers' demonstration to his agents and to the public at large has attained a vast popularity. Thus by way of introducing the new Model "9 H" Stoddard-Dayton car, the Dayton Motor Car Co., in addition to placing their own demonstrators in the hands of their individual representatives, sends out its own traveling exhibit in the hands of a factory expert to a tour of a dozen cities or so, in five different states, and to the tune of somethink like 2,000 miles of travel over all sorts of roads.

STODDARD-DAYTON DEMONSTRATORS AND THEIR LONG ROUTE

The trip has just been completed, and as the accompanying picture shows, passed off without visible effect upon the car. The points covered were: Indianapolis, Chicago, Kalamazoo, Detroit, Toledo, Cleveland, Erie, Buffalo, Franklin, Pittsburg, Columbus and return to the Dayton home of the car. The total mileage of the trip, including side demonstration runs in several of the stopping places, amounted to just 2,164 miles. The total gasolene consumption for the journey amounted to 112 gallons, or an average of 19.36 miles per gallon, inclusive of all motor running. The car was absent from Dayton exactly one month.

Farmers Want Buggy Type Vehicle.

In what degree the automobile is supplanting horse drawn vehicles was the substance of the main question before the tenth annual convention of the Tri-State Vehicle and Implement Dealers Association, at Cincinnati, O., last week. Almost every dealer at the convention had ideas on the subject, and the consensus of opinion was that while the motor car is undoubtedly cutting into the sale of the larger vehicles, such as carriages, the demand for light buggies, runabouts and phaetons has not been affected. The delegates took up the matter of handling the small buggy type automobiles, and it was shown that farmers are taking very kindly to the machines and that the vehicle dealers will find it necessary to get into this field

To Prevent Screw Threads Rusting.

A mixture of graphite flake and grease applied to screw threads is frequently recommended as tending to prevent the adhesion of the parts due to rust or expansion from heat. Rather a novel recommendation in the same line is to the effect that mercurial ointment similarly applied serves an equally useful purpose. It was formerly employed in marine steam engine practice in cases where the parts of the piston were threaded together. Some such provision should be made on all brake and radius rod connections about the car and any other parts which, though occasionally requiring adjustment, are ordinarily left to themselves in all weathers.

ELECTRIC IN STRENUOUS TRY-OUT

Testing Tour from Lincoln to New York City Successfully Made—Mountain Roads Negotiated en Route.

No small achievement was marked by the arrival in New York City on Saturday last, 28th ult., of Oliver P. Fritchle, who left Lincoln, Neb., on November 1st, in an electric victoria of his own design, with which he made the entire journey of 1,800 miles. The tour, perhaps the longest ever attempted with an electric machine, was made partly with the object of selecting a suitable site for a factory to be erected for the manufacture of more of these cars, and partly to demonstrate that the electric automobile is practicable for long distance touring.

Fritchle is a chemist and electrician of Denver, Col., and the car has a maximum of about 10 horsepower, is geared so that it is capable of making 19 miles per hour under favorable road conditions and will travel 100 miles on one charge, although it is said to have covered as much as 125 miles at one stretch without replenishment in open country, and 150 on city streets. While the inventor proved that it was possible to drive his car a long distance, averaging between 70 and 90 miles a day, he doubts whether anyone other than an experienced electrical expert would have succeeded.

Leaving Lincoln, he set out direct for Pittsburg, Pa., pushing his way through miles of rugged Iowa roads. In Illinois he found conditions somewhat better and at Chicago, hit the trail of the 1907 Glidden tour. This meant the crossing of the Allegheny Mountains, and the Laurel and Blue Ridges that have proved difficult for gasolene cars more than once. In the latter part of the trip the route of last summer's Glidden tour was taken up and the run to New York made via Philadelphia—the last stretch on a single charge.

On the trip Fritchle was accompanied by W. P. Pfaff, of his firm at times, but as a rule the latter acted as the advance agent of the expedition, arranging for charging stops. According to the driver, only once on the whole 1,800 miles was it necessary for the car to be towed, and that was due to misdirections. This occurred in a remote section of Iowa, when he was within two miles of the charging station he was endeavoring to reach. Difficulty in obtaining "juice" was frequently encountered and on numerous occasions, Mr. Fritchle was obliged to do all the work of charging at lighting plants and power houses. In one Pennsylvania mining town, he even earned a fresh charge for his batteries by repairing the electric plant of a "nickelodeon." A remarkable feature of the trip was that it was made on a single set of Goodyear tires, and that but one puncture was encountered during the entire journey.

THE CHARACTERISTICS OF BENZOL

Its Possibilities as Fuel for Internal Combustion Engines—Synopsis of Tests in Comparison with Gasolene.

Efforts to perfect the introduction of Benzol as a motor fuel abroad have thus far been about as successful as the attempts made in this country to popularize the use of denatured alcohol for the same purpose. Despite numerous tests and a reputed actual use of the fuel in practical ways to a limited extent, the majority of motorists and more particularly the automobile manufacturers still remain indifferent to the possibilities held out by this plentiful by-product. How great these possibilities are, as well as how improper carburation has led to an erroneous impression as to its properties as a fuel, is shown by M. A. Grebel, in a paper read before the Societe des Ingenieurs Civils de France, and also in a discussion of the relative merits of benzol and gasolene published in Le Genie Civil.

A condensed summary from these two sources shows that almost all benzol is produced as a by-product in the manufacture of coke, the process of extraction from the waste gases consisting of dissolving the crude benzol in heavy oils and later recovering it from the solution by distillation. It is then rectified by the removal of carbon bisulphide, tar, naphthaline, and other impurities, and a final purification is obtained by washing with acids, soda and other reagents. If the benzol is intended for use in automobile motors, this purification must be very carefully performed. If it is improperly carried out tarry products are left which interfere with the proper working of the carburetter and give rise to obnoxious and corrosive fumes. About five kilograms or 11 pounds of rectified benzol are recovered per ton of coal coked. In the present state of the industry, France, Germany, England and Belgium produce large quantities of benzol annually, but the amount could be largely increased in all countries.

The comparative physical properties of benzol and petrol, according to Grebel, are as follows:

	Benzol.	Gasolene.
Density	.885	.700
Calories per kilogram.		
Calorific power	10,033	11,464
Calories per litre.		
	8,879	8,025
Degrees C.		
Freezing point	—6 to —8	—100
	Grammes	
Quantities of fuel added 1 litre of air at 0 deg. C. and 760 mm.	.09615	.08434
	Cubic centimeters.	
for theoretically complete combustion	.10864	.1205
Degrees C.		
Vapor tension at 20 deg. C.	122	296
Temperature of boiling	81	50

The close similarity between benzol and petrol has been the cause of many disappointments and vexations. It has led to the belief that benzol could be simply substituted for gasolene without any difficulty, and it must be admitted that by accident certain motors have worked well for a time within certain narrow limits of speed. In cases where bad results have been obtained, however, they have been hastily and erroneously attributed to the fuel itself. Benzol, indeed, presents many points of similarity to gasolene, but it is distinguished from it by various characteristics, of which account must be taken in the design of carburetters and in the regulation of ignition.

The principal charge made against benzol is that it causes fouling, but the black smoke, the odor of burned gases and the fouling are due entirely to imperfect combustion. Grebel declares that he has made upwards of 200 tests on a Panhard motor and has never encountered any fouling except when testing a benzol only 50 per cent. pure. It is an easy matter to prevent fouling, because, in order that a deposit of soot may be formed, it is necessary that the proportion of benzol in the fuel should be raised to double that theoretically necessary for complete combustion. Many carburetters, however, make an explosive mixture imperfect to a degree that would be believed impossible without the striking evidence of analysis of the waste gases. The influence of the mixture on the efficiency of the benzol motor cannot be too strongly emphasized. Even when the exhaust gases are colorless and odorless and the motor seems to be working perfectly, the combustion and consequently the efficiency may be relatively poor.

The investigations referred to have shown that the minimum specific consumption corresponds to a percentage of carbon dioxide in the exhaust gases of 14 in the case of gasolene and 17 in the case of benzol, without excess of oxygen and without carbon monoxide. These are the highest percentages attainable in practice, though the theoretical percentages of complete combustion are 14 and 17.4, respectively. The maximum of power is found at about the point of maximum explosibility which corresponds to the highest explosive pressure. This is given by a mixture slightly richer in benzol than the mixture for theoretically complete combustion. With the mixture giving maximum power, about 1½ per cent. of carbon monoxide is found in the burned gases. In Grebel's tests the minimum of consumption has always been found to be attained when the air actually introduced bears to the air theoretically necessary the proportion of 1 to 1.1. This differs considerably from the proportion of 1.3 to 1.7 recommended some years ago by Sorel and adhered to by many builders through fear of the results of a shortage of air which possibly might occur under certain conditions.

LEANING TOWARD SHAFT DRIVE

Ferguson Finds a Strong Movement in This Direction in Foreign Factories—Plain Bearings Regaining Favor.

A continuance of the growth in the use of propeller shaft transmissions and a tendency among makers who have been using ball bearing crank shafts to return to the use of plain bearings for that purpose, are the two trends most marked in the foreign field just at present, according to David Ferguson, mechanical engineer of the George N. Pierce Co., who has just returned from a brief sojourn abroad. Ferguson visited the leading factories of England and France, and inspected the new models which the German and Italian makers are preparing for the market of 1909. The increased use of shaft drive, he notices in particular, while those who have abandoned chain drive show no disposition to return to that form of transmission.

"From present indications," he says, "not over two years will pass before every maker of any great prominence in Europe will have abandoned for good the chain drive and installed a shaft drive in all of his models. This movement is not confined to the makers of any one country, but is noticeable equally in England, France, Germany and Italy. Some manufacturers have confined the shaft drive to their new and usually lighter powered models, retaining practically their former construction for their high powered cars. The change to the shaft drive for their high powered cars is only a matter of a short time. Other makers, on the other hand, have made the change throughout their line at the same time. There has not been a single change from the shaft to the chain drive that I have heard of.

"The most prominent general tendency aside from the matter of final drive is the reversion to plain bearings. Several years ago two manufacturers, one French and the other German, both of whom stood high in their own countries, adopted ball bearings for the crank shaft. The outcome of their policy was watched with a great deal of interest by automobile makers throughout the world. This year marks the definite abandonment by them of their experiment and their return to plain bearings from one end of the crank shaft to the other.

"So far as actual business goes," he concludes, "the foreign manufacturers have had a rather dull twelve months, but affairs now appear to be in better shape and a number of factories are running at capacity."

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

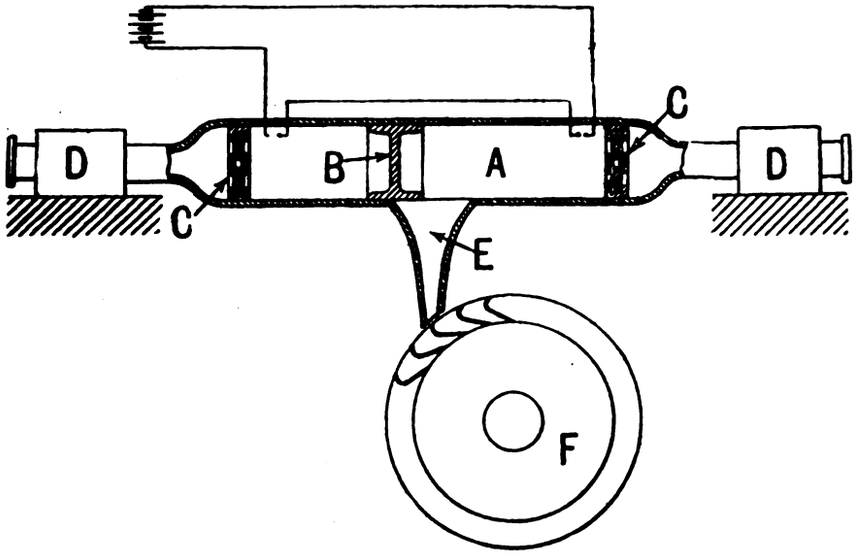
NOVELTY IN FOUR CYCLE TURBINE



Young French Investigator Produces Design Utilizing Reciprocating Piston—Fresh Adaptation of an Old Idea.

Development of the gas turbine idea up to this time has produced comparatively few devices of noteworthy merit. Despite a considerable amount of effort along this tempting line, practically no systems have been produced which appear to promise much for the future, while many of the arrangements constitute what are actually embodiments of schemes which long ago saw the light in one form or another as intended for use with steam. The fact that the turbine principle introduces difficulties which are not met with in ordinary gas engine construction ordinarily, however, does not deter inventors from continuing their investigations, and happily they are continuing to produce results which though impracticable as it may seem just now are paving the way for later products which are likely to be granted a greater measure of success as the earlier efforts are used as stepping stones.

In this connection, considerable interest has been aroused in foreign circles by one of the latest productions of R. Esnault Pelterie, the young French investigator whose five and seven-cylinder V-shaped motors for aeronautical work are among the few "features" at the Paris Salon. His studies of the turbine principle have resulted in a design which, so far as is known, is absolutely novel, and which aside from its interesting qualities as aclever study, introduced several rather fruitful possibilities.

Roughly speaking, the scheme may be said to be that of the exhaust turbine employed as an adjunct to the reciprocating engine of the usual four-cycle type. Only in this instance, the reciprocating piston does no external work whatever, and is merely used to establish the action of the cycle, while its movement also serves to open communication between the outlet to the turbine and the two cylinders alternately. In this respect the system is unlike one which has received consideration before, in which the use of the turbine was intended merely as an adjunct to the reciprocating engine and as an economizer for the energy ordinarily going to waste through the exhaust.

The accompanying illustration is given by the Autocar as showing diagramatically the way in which the turbine action is secured without sacrificing the four-cycle principle. The engine construction comprises a very long cylinder, A, in which is mounted slidably a piston, B, free to reciprocate practically from one end to the other. Midway between the two ends of the cylinder is a port leading to a nozzle, E, which is placed in proper relative position to drive the turbine wheel, F. Obviously, the movement of the piston alternately opens the two ends of the cylinder to the nozzle. As each end of the cylinder is made to act as a separate cylinder, actuating a cycle in every respect similar to that of the common or Otto type of engine, it is evident that alternate blasts of burning gas are driven down against the turbine to perform work in driving it.

Two chambers, D, are used in carburetting the air as in the ordinary gas engine, and the charge enters the chamber at either end through the valves, C. The action is readily understood. As soon as a charge has been ignited by means of the ordinary jump spark, the piston is driven violently forward toward the other end of the cylinder, thereby compressing a charge of gas which already has been drawn into the combustion chamber. As the piston passes the central port, release occurs, and the charge is permitted to expand and escape into the turbine nozzle.

The manner in which the cycle is completed is rather intangible, but according to the patent specifications consists in inducting the fresh charges as a result of the formation of a partial vacuum behind the outgoing charges, brought about by the combined effect of its own inertia and the movement of the piston beyond the port. The effect secured in this way, therefore, is that of a very rapid succession of impulses, which probably permit the turbine casing to clear itself better and allows of a lower mean temperature in the blades than would be possible were the blast of hot gas continuous.

Safeguarding Control for Electrics.

With gasolene cars there is a big record of accidents resulting from the change gear lever being moved from neutral to engagement by meddlers while the car is left unattended, resulting in the machine's jumping forward when the engine is started unless the driver has been careful enough to examine the position of the lever, and similar accidents with electrics have followed where the control lever has been pushed to the high speed position in the operator's absence. Upon inserting the connection plug the person driving the machine would be surprised to find it dash forward on the instant. A woman was recently dragged some distance and knocked unconscious when she placed the plug in position preparatory to stepping into her runabout. While the vehicle was left at the curb, some sidewalk busybody had moved the control to the extreme notch and had left it that way. The machine ran away immediately the power circuit was closed by the plug, and after injuring its owner, smashed itself against a tree further down the street.

To provide against the possibility of such accidents, the controller on at least one make of electric vehicle, the Waverley, is so arranged that even after the circuit plug has been inserted, the machine will not start until the lever is brought back to the neutral position, so that it may be in any forward speed or the reverse at the time the plug is put in, without danger of an unexpected movement. A further feature of the control, showing the provision that is now made to protect against error or accident in electric vehicle operation, makes it impossible to change from high speed forward to high speed reverse. If the mechanism be shifted from one to the other with a rapid movement, the controller automatically shuts off the power, so that the change in direction must be begun on the low speed.

Care Needed in Selecting Oil.

The selection of tires, lamps, and in fact the general equipment of a car is carefully supervised by the owner, while when it comes to oil, the chauffeur is often given a free rein or the deciding factor is price rather than quality. The oil bill is probably one of the smallest items in the upkeep of a car, while upon its selection may depend the life of the engine.

The Week's Patents.

897,099. Transmission Gear. Philip Hayward, Hanging Rock, Ohio. Filed March 6, 1908. Serial No. 419,445.

1. In a transmission gear, the combination of a driving shaft, gearing for connecting said driving shaft in operative relation to said driven shaft, a clutch for connecting said gearing with said driving shaft and disconnectng the same therefrom, a revoluble member mounted upon said driven shaft, a friction disc mounted upon said driving shaft and adapted to intermittently engage such revoluble member upon said driven shaft for the purpose of applying power directly thereto, and means controllable at will for throwing said clutch and friction disc into action alternately.

897,122. Spark Plug for Internal Combustion Engines. Henry C. Ter Meer, Summit, N. J. Filed March 27, 1908. Serial No. 423,722.

1. An electric ignition device comprising an outer insulator having a central opening throughout, an inner insulator of elongated form having within it an electrode and held within the opening of said outer insulator, the walls at the outer end of said opening converging, a binding post within the outer end of said opening and tapered to conform to the walls thereof, and a binding nut on the exposed threaded end of the post for securing the same in position; substantially as set forth.

897,151. Pneumatic Tire. Walter C. Rocheleau and Louis T. Rocheleau, Woonsocket, R. I. Filed March 2, 1907. Serial No. 360,165.

A pneumatic tire comprising a covering, a layer of tough material arranged against the inner side of the outer portion of the covering, a band of resilient or springy material of convex-plano form in cross section arranged at the inner side of the said layer, a flat metallic hoop arranged against the inner flat side of the convex-plano band, a layer of tough material arranged at the inner side of the hoop and extending alongside the side portions of the first mentioned layer and connected to said side portions at a point intermediate the edges thereof and the hoop, a layer of tough material having a loop portion arranged against the second mentioned layer and also against the extended side portions of the first mentioned layer and connected to the said extended side portions and also having surplus edge portions lapped one over the other, and an inflatable tube contained in the said layer.

897,202. Hydrocarbon Burner. Burton C. Hamilton, Chicago, Ill., assignor, by mesne assignments, to Stanley Motor Carriage Company, a Corporation of Massachusetts. Filed Nov. 5, 1901. Serial No. 81,274.

1. The combination with a steam generator of a main burner therefor and having a combination chamber arranged between said generator and burner; a fuel vaporizer located within said combustion chamber and connected to said burner; a swinging heating and lighting torch adapted to play upon and heat said vaporizer; and means for supplying fuel to said torch connected to the vaporizer.

897,209. Automobile or Vehicle Tire. Godfried Knadler, Cleveland, Ohio. Filed Aug. 20, 1906, Serial No. 331,242. Renewed Oct. 16, 1907. Serial No. 397,677.

1. A non-inflatable cushion tire for vehicle consisting of a single endless molded tabular body having separate base portions adapted to abut and form a solid sustaining wall on a central line through the base of the tire, and said body having its greatest thickness next above the immediate base on lines corresponding substantially as shown and described.

897,230. Motor Vehicle. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass. Filed Sept. 3, 1904. Serial No. 223,247.

1. In a motor vehicle, the combination of a motor, fuel-supplying apparatus therefor comprising a throttle, an automatic clutch device between the motor and a driven part, a single device for controlling the said throttle and the operation of the automatic clutch device, and a stop for limiting the closing movement of the throttle so that the motor may continue to run but at a speed too low to permit clutching engagement of the said automatic clutch.

897,259. Method of Carburetting Air for Explosive Engines. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to the Winton Motor Carriage Company, Cleveland, Ohio. Original application filed June 23, 1906, Serial No. 323,117. Divided and this application filed April 15, 1908. Serial No. 427,197.

1. The method of uniformly carburetting volumes of air moving alternately at different velocities, consisting in subjecting the slowly-moving volumes of air to surface contact with a body of volatile liquid, and the rapidly moving volumes of air to sprayed volatile liquid.

897,261. Transmission Mechanism. Chas. E. Duryea, Reading, Pa., assignor to Corbin Motor Vehicle Corporation, New Britain, Conn., a Corporation of Connecticut. Filed Sept. 28, 1907. Serial No. 394,962.

1. In a transmission mechanism, a driving shaft, a driven shaft, a plurality of change speed gears held against rotation but adapted to slide on one of said shafts, an internal gear connected to the other shaft, means to shift the first mentioned gears longitudinally on their shaft support to cause either one to face said internal gear, and means to shift the first mentioned gears and their support laterally to cause either of said gears to mesh with said internal gears.

897,270. Running Gear for Vehicles. William H. Chapin, Springfield, Mass. Filed Dec. 11, 1905. Serial No. 291,286.

1. A vehicle running gear comprising a frame or platform, a wheel frame consisting of an axle, two supporting arms therefor, means to pivot said arms between their extremities on an axis parallel with said axle, and pneumatic cushions disposed at opposite ends of the supporting arms, one on each side of the pivotal point therefor, to yieldingly restrict the movement of the ends of said arms in opposite directions.

897,368. Automobile. Henry K. Holsman, Chicago, Ill. Original application filed Feb. 8, 1907. Serial No. 356,393. Divided and this application filed June 12, 1907. Serial No. 378,502.

1. In an automobile, the combination with running gears, of a steering wheel having its axle pivoted thereon, a steering arm secured to the axle, a vertical rock shaft, link connections between the rock shaft and the steering arm, a horizontal arm connected to the rock shaft to swing it to steer the vehicle but movable relative thereto, an elongated handle and sleeve journaled on the horizontal arm, engine-throttling mechanism, and connections between the engine throttling mechanism and the sleeve, whereby the latter may be rotated in one position of the arm and moved longitudinally thereof in another position to control the speed of the vehicle.

897,421. Brake for Automobiles. Gordon Stables, Philadelphia, Pa. Filed April 24, 1907. Serial No. 370,009.
